The Buffett name had worked heavily against Peter when it came to raising money, because people assumed that he had easy access to unlimited funds. People did not take him seriously about not having money until he actually mortgaged his house to fund the show. Warren, typically, offered to pay the last ten percent of the cost if Peter could raise the rest. When he had raised two million of the total, his father went ahead and gave him $200,000 of the $300,000 he had promised. Peter then raised the rest of the money himself, much of it through a grant from the Rudolph Steiner Foundation. From start to finish he struggled against heavy odds to raise funds while trying to stage and produce the show at the same time. His parents, during the same months, waived their "no donations" rule and wrote a $10 million check to Tom Murphy's Save the Children as a gesture of friendship and support.

It seemed a little chilly—even in the name of cultivating self-reliance—to support their son's cause with only two percent of what they gave a family friend. With hindsight, however, Peter was grateful that his show did not become a vanity project funded by his father—which no one would have taken seriously. He felt that the way his father handled it was one of his typically brilliant solutions to complex problems. It gave Peter his family's endorsement, for which he was grateful, while still allowing him the struggle and pride of raising most of the three million needed by himself—although he could have used that last hundred thousand dollars.

Warren did not quite understand his son's fascination with Native Americans. He (and much of the rest of the family) thought of it as "the Indian show." Warren had never been self-reflective, and the show's symbolic exploration of stolen identity, and the triumph of man's will in reclaiming what was lost, escaped him.

Spirit—The Seventh Fire was a dazzling story acted by a Native American who told the story of his return from the modern world to reclaim his cultural heritage. The self-enclosed stage resembled a tent, spacious and intimate, contemporary yet historic. Peter's music, exotic yet familiar, flowed and pulsed around the audience while Native American performers in wildly feathered costumes danced and sang against a background of epic film.

Susie had been angry at Peter all spring over his obsession with the show. Peter had a much different personality from his father, but Susie felt that he risked turning into a musical version of Warren, of jeopardizing his marriage to Jennifer. She could take in all of the effects and feelings in the show, however, and let the music intensify her other senses. She appreciated Peter's artistic accomplishment. Warren loved music and was proud of his son, but, sitting at the premiere, the show's multilayered kaleidoscope of visual impressions overwhelmed him, leaving him uncertain what to make of it. He looked at others in the audience and saw people clapping and cheering, which told him that the show was good. And when the *Omaha World-Herald* called it "poignant, sad, uplifting, thrilling, and powerful," he was delighted. He had been internally holding his breath in anticipation of this moment for more than a year, and his relief that Peter had succeeded on such a large scale was obvious. But he also feared, with reason, a hometown bias and waited to see if the show would be well-received elsewhere.

As *Spirit* continued to play in Omaha, Susie went to Laguna with a group of her grandchildren. They were used to Susie indulging their wishes and giving herself to their needs, going here and there with them, the perfect grandmother; she didn't disappoint them now. She took them shopping at the mall, like old times, sitting in a chair and pointing at things around the store, saying, "I'll take one of those, and two of these, and one of those."[14] After this visit, she was exhausted, but began to prepare herself for the annual trip to Herbert Allen's post–Sun Valley gathering.

The wisdom of spending another long weekend with a crowd of people at the high altitude of Cody, Wyoming, so soon after Sun Valley, seemed questionable. Some in the family were strongly against her making this trip. But Susie was doing cartwheels at the sheer joy of living, and Warren wanted to feel that everything was back to normal. Thus, the last week of July, Warren and Susie reunited for a long weekend at Herbert Allen's J—9 ranch.

Susie struck people as exuberant, elated to be there.[15] At dinner in the great room, where an oversize fireplace took the chill off the high mountain air, she was chatty and outspoken, proposing that the guests take a straw poll about the upcoming election.[16] Afterward, when the table had been cleared and everyone was thinking about dessert and coffee, she stood in the kitchen, telling people how much closer her illness had brought her to her daughter.[17] Suddenly, she blinked and said there was something funny going on inside her head.[18] For a split second, Herbert Allen thought she was doing a silly dance step. Then he realized she was going down. As her legs buckled, he and Barbara Oehrle caught her before she hit the floor.[19]

They carried her to a nearby couch, where the yoga teacher Herbert Allen had brought in for the weekend held her. They sent Warren off to their cabin to get her pills. Susie's health had always been so uncertain, and she had pulled through so many other crises, that nobody thought it was that serious. Still, they put through a call for paramedics. Warren called Susie Jr., who was at the Democratic Convention in Boston with Bobby Shriver and Bill Clinton, watching John Edwards speak. He said something about a headache and asked for Dr. Isley's phone number. She gave it to him and he hung up. She wondered briefly if something was wrong, then thought, My mother could have broken her toe and he would be calling for Dr. Isley's number.[20]

Lying on the sofa, Susie was having trouble lifting her arm. She vomited a couple of times and said she was very cold and her head hurt terribly. They wrapped her in blankets. She began drifting in and out of consciousness, at times struggling to speak. Warren had managed to get the information about her prescriptions that the paramedics would need. As he observed Susie's condition, he grew more and more distressed; it was becoming apparent that she had probably had a stroke. The other guests waited, helpless, for the ambulance to arrive. The time passed slowly. After a while they all grew more hopeful when Susie commented that her head felt better and started responding when asked to move her arms and feet. Then the paramedics arrived and did a few tests. They placed her onto the ambulance cot and wheeled her outside, as Warren followed. After lifting her into the back of the ambulance, they climbed inside and shut the door. Warren got into the front seat and the driver began the thirty-four-mile journey through the winding mountain roads to West Park Hospital in Cody.[21]

As soon as they were in the ambulance, Warren called Susie Jr. "You need to come here," he said. "Something has happened to Mom. I think she's had a stroke." A few minutes later he called again and said, "You need to find your brothers and bring them with you."

Susie Jr. reached Peter in Omaha, where he was in his hotel room preparing for the show. She found Devon in a Wal-Mart in Indiana. "Where's Howie?" she asked. "In Africa," said Devon. "He's landing in about half an hour." Susie Jr. tried to hurry the NetJets plane that was coming first to Boston to pick her up and then to collect Peter in Omaha before continuing on to Cody.[22] By then, Howie had landed in Africa and gotten word to call his sister right away. His first thought was, Something's happened to my dad. His second thought was, Something's happened to Peter. "I absolutely did not think it was my mom," he says. He was horrified to be stranded with no way to get a return flight until the next day.[23]

While Susie Jr. worked on logistics, Herbert Allen and a friend, Western sculptor T. D. Kelsey, followed the ambulance in Allen's car. They grew frustrated at how slowly the ambulance was proceeding; it upset them that Buffett was trapped inside and subjected to the interminable ride. At one point they pulled up alongside the ambulance and Allen shouted at the driver, asking what on earth was going on, but no one answered.

When they finally reached the hospital, the CAT scan revealed that Susie had had a massive cerebral hemorrhage. Warren paced back and forth in the emergency room, and eventually the doctor came out and told him that Susie had little chance of lasting through the night. Tearful and distraught, he went out to the

lobby and told this to Kelsey and Allen.[24] Then he walked back upstairs and sat in the room with Susie, waiting. They were alone.

At around four-thirty a.m., the plane carrying Susie Jr. and Peter arrived. After their car pulled into the hospital parking lot, its mountain backdrop much like that at Sun Valley, the first person they saw inside the lobby was Herbert Allen. Susie Jr.'s first thought was "Oh, my God, this feels just like Mrs. Graham."

Upstairs, they found their father sitting next to their mother, holding her hand. A Cherry Coke sat untouched on the table nearby. "I've been here for five hours," he said. Susie was so quiet, you couldn't see her breathing underneath the little oxygen mask.

Warren went to lie down on the bed in the adjoining room. Peter lay down on the floor, and both fell asleep. Susie Jr. sat down in a chair next to her mother on the bed, touching her.

A little while later, she realized that Susie wasn't breathing. She went and found a nurse. Then she braced herself and woke her father up to tell him.[25]

Warren wept while his children spent the next few hours doing what had to be done. They worked with Herbert Allen to draft a press release, signed off on the papers required for the release of the body and the organ-donation procedures, took care of the arrangements for their arrival in Omaha, and made calls to Astrid, Kathleen, and others who were close to Susie and Warren so they wouldn't get the news on the CNN crawl. By noon all of them were on the G-IV for the worst flight any of them had ever taken.

After some time in the air, Warren took a deep breath and asked, "Is there a bathroom in the front?" There wasn't. "Walk with your back to the couch," Susie Jr. told him. He inched his way to the back of the plane, his eyes averted from the plane's sofa, where the zippered bag that contained Susie's body lay.[26]

When they landed in Omaha, the family had another surreal experience as the plane taxied straight into the hangar, where a hearse was waiting, rather than stopping on the tarmac, so that they could deboard without having their grief invaded by a band of paparazzi. Warren went straight home, walked upstairs into his bedroom, shut the door, turned off the lights, and got under the covers.

Astrid knew what to do, which was nothing. She made sure he had his sleeping pills and left him alone. Now and then she went over to Susie Jr.'s and cried herself. The rest of the time she stayed at home to take care of Warren.

The next day, Friday, he was still under the covers. Ron Olson, who had some legal obligations under Susie's will and was a close friend and strong influence within the family, particularly with the children, arrived from Los Angeles with his wife, Jane. Warren came downstairs, and the Olsons sat with him for a while. Within an hour, the phone rang. It was Don Graham. "Where are you?" asked Susie Jr. "At the Hilton downtown," he said. He had known to come without being told. Then Susie Jr. drafted a couple of her own friends to join them at the house. Over the next several days, they all sat in the living room to help distract Warren and make sure that he was never alone. At nine-thirty each night, he went up to bed and took his sleeping pill.

A day or two later Warren tried to call a couple of people. When they answered, no words came out; his throat had closed. He gave up trying to talk and heaved with sobs for a few minutes. Then, when the storm of tears passed, he choked out, "I'm sorry," and hung up the phone. They would never have known who it was, except that the sound of Warren sending out an SOS was so unmistakable.

Susie Jr. had already sent for the people who were needed. The following week, Bill Ruane and Carol Loomis arrived to visit for a few hours. Sharon Osberg came. Bill Gates arrived. Kathleen Cole flew in. And Howie finally returned from Africa after "the longest trip home," one that he never wanted to think about again.[27]

Bill and Sharon went ahead with a bridge tournament they had been scheduled to play in—with Warren—that week. He managed to join them for dinner one night at the hotel where the tournament was

being held, and he did watch them play for a while, which helped to distract him. Another night they were over at the house, where Warren wanted them to sit with him to watch the Charlie Rose video of Susie's interview. Astrid didn't want to see it, which was just as well, and he was afraid to watch it alone. They put it on the DVD player and it began to play. After a while, Warren was weeping. Bill left the room while Sharon crawled into his lap and rocked him as he cried.[28]

The mere mention of Susie's name sent Warren into tears. As the funeral approached, it became apparent to Susie Jr., who was planning the event, that something else was bothering her father. It dawned on her what this must be. "You don't have to go," she told him.

Warren was overcome with relief. "I can't," he said. To sit there, overwhelmed with thoughts of Susie, in front of everyone, was too much. "I can't go."[29]

Unlike Warren, hundreds of others did want to grieve for Susan Buffett in person, at some sort of memorial service. None was ever held. Only the family, a couple of Susie's closest friends, Bono and his wife, Ali, and Bobby Shriver were invited to the funeral. Susie's musician friend Dave Stryker played the guitar, and the Reverend Cecil Williams from Glide Memorial Church conducted the service. Bono sang "Sometimes You Can't Make It on Your Own." The grandchildren wept.

And for several weeks more, that was all. Warren faced the emptiness. Many people, including Susie herself, had questioned how well he could survive without her. He had never recovered from the death of his father and still could not face the unfinished business of Howard's boxes of papers in the basement. As Sharon put it, he had a tendency to think in the third person. But he suffered this time in the first person, grieving fully, living in the now, even though the now terrified him.

Susie's death carried with it deep intimations of his own mortality. His seventy-fourth birthday was approaching with its metronomic tick of doom. He wanted cheering up badly and talked to a couple of friends who then made plans, as he wished, to visit him in Omaha on his birthday. A few days later, Susie Jr. called them and said, *Don't come.*[30] Warren wasn't ready. Indeed, distraction was not the best thing for him. The process of mourning could not be shortened; it could only be endured.

He could not escape from grief, even in sleep. The nightmares haunted him, every night the same. The separation from Susie, the split that he had never been able to contemplate during all the years of their living apart, was happening right before his eyes. He was captive on the endless ride to the hospital in Cody, locked inside the ambulance, helpless to help her, unable to stop the momentum of the wheels. The silent mountains stood silhouetted against the July stardrift in the thin evening air. Silently the driver picked his way through the winding hills. The road unreeled before them, mile after mile, rows of trees passing like pilgrims up to the foothills above. In the back, Susie lay on the cot, pale and still. The sounds in the ambulance faded as the miles went by. Strands of juniper hung like dim moss from the mountainsides while the road ahead stretched thinner in the distance. The stars fell still in the vast black overhead. Time slowed to eternity.

All he had ever asked of her was not to leave him, and she had promised that she never would. No matter how many other people she had cared for and supported, no matter which way her heart had tugged her, through all her travels, no matter how many different directions she had run, Susie had always come back to him. She had never let him down.

Now there was no response. He needed her so much that it was impossible that she would leave him. He would hold on, he would not let go; therefore she must stay with him.

The ambulance crept onward through the darkened mountains. The quiet hum of the oxygen tank mingled with his tears. In the back there was only calm, a bare whisper of breath, no obvious sound of pain.

It was Warren's chest that burned, it was his heart that exploded with each revolution of the wheels. You can't leave me, you can't leave me, please don't leave me.

But Susie was already passing beyond his reach; she was now in other hands. And the force of her withdrawal from his world to the next was tearing him apart.

Claim Checks

Omaha and New York City • 2004–2008

The first aftershocks of Susie's death occurred at the reading of her will, even though most of its provisions were not unexpected. She left nearly all of her Berkshire stock, worth almost $3 billion, to the newly renamed Susan Thompson Buffett Foundation, now headed by her daughter. Another six hundred shares, worth $50 million at the time, went to each of her children's foundations.

She had been generous to people she cared about, although her husband's influence doubtless dampened her generosity. Her children each received $10 million. A long list of other people, headed by Kathleen Cole and her husband, received smaller amounts. She had amended her will in the year before her death through a codicil executed by a new lawyer; the codicil gave John McCabe $8 million. It also left $1 million to Ron Parks, the friend who had spent so many years as the de facto chief financial officer of "STB Enterprises."[1]

The secret codicil shocked nearly everyone. Susie had never reconciled the divisions within her world and in the end chose to leave them unexplained. The life she lived for others was her legacy; her inner truth would remain forever unspoken. Thus it would be left to others to form their own interpretations.

Warren had long loved his wife as an ideal. She had been the "grounding person who was his connection to the outside world" as well as the "glue that held the family together."[2] After her death, he was never able to look at Susie's photograph without crying. But he did not lapse into a years-long depression, or commit suicide, as Susie had suggested he might. Instead he mourned. For about two months, he seemed deeply depressed. And then, as most people do, he gradually returned to living his life. The bathtub memory went to work and his love for Susie overcame the rest.

"That was the most important relationship he had personally," says Howie. "No question about it. And he depended on it heavily. But my dad is a survivor. Anybody who thought he was going to fall apart because my mom died, I think didn't know him. Because he is not going to fall apart over anything. He's got his own toughness, even though people may not see him that way. He didn't get to where he is because he's some kind of wimp."[3]

That toughness helped him not just to survive but to adapt and even to grow. When the dreamlike assumption that "Susie will take care of everything" popped like a soap bubble, Warren began to show a newfound realism. As each month passed, he began to deal more acceptingly with endings and mortality and to connect with his children in a new way. As his sister Bertie would say, Susie seemed to have willed him some of her strength, a little of her emotional fluency, and a lot of her generosity. Warren seemed to be acquiring unexpected dimensions to his inner life. He reclaimed some of the responsibility for the emotional territory that he had always left to his wife. He became more aware of his children's feelings, of what they were doing and of what mattered to them.

Susie Jr. quickly stepped into the leadership role that her mother had played, especially when it came to philanthropy, a job for which she had been preparing much of her life. She began to hire and to enlarge the foundation's offices to plan for the much larger sums of money it would now be giving away. Running two foundations seemed to her a wonderful opportunity, not a burden.

Peter was taking *Spirit—The Seventh Fire* to the National Mall in Washington as part of the celebration for the grand opening of the National Museum of the American Indian. One day he called his father to say, Dad, we're setting up the tent! Afterward he realized that, in the past, he would have called his mother, who would have told his father. It felt good to have a direct connection.[4] Warren gathered a group of friends and flew to Washington to attend the cocktail party and opening night. By the time *Spirit* opened, Peter had released or contributed to thirteen albums and soundtracks. But with the show, Warren felt a different connection with his son—not just because of Peter's success, but through the effort they were making to be part of each other's lives.

When *Spirit* arrived in Philadelphia, it got the kind of recognition that Buffett understood: It was compared to "a Native American version of Philip Glass's dance performance/opera *1,000 Airplanes on the Roof*" with "guitar rolls that would put U2's The Edge to shame."[5] Its costly production, however, meant that even with high ticket prices, *Spirit* was losing money as a touring show. Peter put it on hiatus and while working on a new CD, *Gold Star,* the first in which he would perform as a singer, began to consider what to do about *Spirit*'s longer-term future.

Howie had published *On the Edge* and *Tapestry of Life,* books of his photographs, and had given exhibitions and lectures on his photography and work in the Third World. His foundation office still looked like a teenage boy's bedroom, with toy jeeps and backhoes and equipment reminiscent of his old teenage CB radio. But his business experience had ripened; he now served on the board of Lindsay Manufacturing and ConAgra and had faced the task of firing two CEOs. Savvy about money, he had kept his CCE stock and had invested in Berkshire Hathaway stock. This latter gesture bonded him to his father as nothing else could. Warren observed how much his son had settled down and matured in the past ten years. Howie, a "marshmallow" emotionally who had always been so close to his mother and had yearned for a warm connection to his father all his life, now saw an opportunity to have a different sort of relationship with him. He and Devon bought a house in Omaha so they could be nearby.

The events following Susie's death affected Astrid deeply. She had lost someone she considered a dear friend, then found out that Susie's life had run on parallel tracks—one of which had always been invisible to her. Years of staying behind the scenes out of deference to Susie and to a marriage that, however unconventional, had been held up to all as some kind of ideal suddenly was revealed as based on a falsehood. She knew Susie's mesmerizing power over Warren and had seen Warren's bathtub memory at work many times, but she was furious that Warren had allowed this to happen and felt betrayed and used. Belatedly, he recognized how high a price Astrid had paid for the arrangement he and Susie had worked out, the realities of which they had both avoided facing all these years. He took the blame and went to work setting things right. Gradually, as he passed through the stages of mourning, he brought Astrid more and more into his public life.

In December, Warren sent all of his grandchildren large checks as a Christmas gift. He had always paid for their college tuition, but he had never before given them money without any strings attached. He wrote each of them a letter offering advice on how to spend it. Do a little something fun, he said, and also pay down your mortgage. But I won't judge you if you blow it. You'll get another check next year.[6]

Buffett made two exceptions to the checks. He did not include Nicole and Erica Buffett, Peter's adopted daughters. Big Susie had loved Erica and Nicole. They had shown up at her funeral dressed in long flowing outfits and wailed like a pair of brunette banshees. Susie had left each of her "adored grandchildren," including Nicole and Erica, $100,000 "as a hug" in her will. But ten days after Susie's funeral, Warren had told Peter, "By the way, I don't consider the girls my grandchildren. I don't want them to expect anything from me in my will." Peter found this inexplicable. "Are you sure you want to do this?" he asked. His father was undeterred. That Susie had given the girls money and specified that they had the same status as her other grandchildren in her will seemed to have roused Warren's feelings of possessiveness about money. Peter let it go, however. He figured that if his father cut the girls out of his will, they would never find out the reason. And indeed, when Christmas came and they did not receive checks, they never found out.[7]

Warren spent New Year's with Astrid at the home of Sharon Osberg and her husband, David Smith, in

California's Marin County. He, Osberg, Gates, and the rest held one of their bridge orgies while Astrid shopped at Trader Joe's. At the beginning of November, Buffett had overcome some earlier reservations that Gates's powerful personality might dominate the Berkshire board, and had invited him to join it. Sharon and Bill had been talking for some time about the challenges that the Buffett Foundation faced. To give away several billion dollars a year after Warren was gone, it would have to change dramatically. No foundation in history had ever succeeded in such a transformation, because no foundation had ever tried. With one exception—the Gates Foundation—no other philanthropic organization had ever worked with such large sums.

Warren had also been thinking about the problem. In the fall, he had videotaped a question-and-answer session with his foundation trustees, making sure they understood his wishes and that these were memorialized. Like Walter Annenberg, he wanted to reduce the chance of being double-crossed after he was dead. After all, Boys Town had eventually double-crossed Father Flanagan. If even Father Flanagan wasn't sacred, then how to handicap the odds on Warren Buffett?

Early in 2005, Osberg "trumped up some pretense" and made a trip to Omaha to speak to Buffett. Given his admiration for Gates, she said, shouldn't he consider leaving his money to the Gates Foundation after he died? Though Buffett reacted noncommittally,[8] he had in fact been considering leaving at least some of the money to the Gateses since well before Susie died.

Charlie Munger had already been encouraging the idea. "It wouldn't surprise me if they had Gates running it eventually," he said shortly after Susie died. "It wouldn't surprise me at all. Warren doesn't like conventional pomposity. Gates is unconventional in the way he thinks, and he's fifty instead of seventy-four."[9]

For a long time Buffett had felt that society was best served if he carried on compounding the money, rather than giving it away, so that there would be more to give away. But delaying the gift until his death also amounted to the White Queen's "jam tomorrow"—a postponement in his struggle with endings, with loss, with death, with letting go. Over the years he had gradually evolved from a boy who stole his sister's bicycle and got other people to buy his barbells, from a father who said no to every request for money from his children, to a man who gave them a million dollars every five years on their birthday, a man who bought a pink heart-shaped diamond ring for his daughter. But he still had some issues with money, which, for example, seemed to have been triggered by Susie's will. Nonetheless, in a profound shift, he was working his way through the problem of whether to serve some of tomorrow's jam today.

That did not mean, however, that the encroachments of time would become easier for him. A year after Susie died, Buffett found himself shocked once again by the impending arrival of another birthday. Could he actually be three-quarters of a century old? He spoke of it with disbelief. Then he seized on examples of health and vitality lasting well into old age: his mother, who had lived to ninety-two; his aunt Katie, who had lived to age ninety-seven; Walter Schloss, who was still playing tennis at almost ninety. And of course, there was his icon, Rose Blumkin.

His seventy-fifth birthday party took place at Sharon and David's, with Astrid, Bill Gates, and his sister Bertie in attendance. His birthday cake was a white-chocolate replica of a $100 bill. On Saturday morning, Smith had arranged for Buffett to take on Ariel Hsing, a nine-year-old Chinese-American Ping-Pong champion. With the video camera rolling, the little girl crushed him. After a fierce bridge tournament the following morning, an artist whom Osberg and Smith had hired came over to amuse Buffett and Gates by trying to teach them the art of landscape painting. Buffett gamely swiped away with a brush at acrylics, but painting, unlike Ping-Pong, was not rhythmic and repetitious, and the results were hilarious. He produced a canvas adorned with trees that resembled brown lollipops. Meanwhile, the previous day's Ping-Pong game was fermenting an idea. Why not add the video of him getting trounced by Ariel Hsing to the ever-expanding movie at the shareholders' meeting?

Before 2003, Buffett's need for attention had been satisfied by a few interviews a year and the shareholder meeting. He had always been careful and strategic in his cooperation with the media (if not always forthcoming about just how cooperative he had been). But starting around the time of Susie's illness, for whatever reason, he had begun to need the mirror of media attention, television cameras especially, almost

like a drug. The intervals he could tolerate without publicity were growing shorter. He cooperated with documentaries, spent hours talking to Charlie Rose, and became such a regular on CNBC that it started to prompt puzzled queries from his friends.

The Buffett who so craved attention contrasted markedly with the Buffett who focused with unaltered intensity on Berkshire Hathaway. To see him flip from one mode into the other in half a second was head-spinning. In addition to adding Bill Gates to the board, he now set up a "whistleblower line" so that employees could report wrongdoing. And—in a major step toward the day when Berkshire's board would have to make decisions without him—he initiated separate meetings of the board without his presence. Yet he remained as focused on investing as he had been as a younger man.

Since the Federal Reserve's dramatic interest rate cuts in the wake of 9/11, the market had steadily recouped its losses until it was nearing bubble-era levels. Buffett wrote in his 2004 letters to shareholders: *"My hope was to make several multibillion dollar acquisitions that would add new and significant streams of earnings to the many we already have. But I struck out. Additionally, I found very few attractive securities to buy. Berkshire therefore ended the year with $43 billion of cash equivalents, not a happy position."* The following year, Berkshire used part of this money to make four small acquisitions—Medical Protective Company and Applied Underwriters, two insurance businesses; Forest River, a recreational-vehicle manufacturer; and Business Wire, which distributed public-relations material for corporations—and one larger acquisition, PacifiCorp, a major electric utility, for MidAmerican Energy. While MidAmerican had not yet spawned a series of huge acquisitions as Buffett had hoped, the wisdom of buying it had grown clearer. Oil prices had continued to rise. MidAmerican had a significant toehold in alternative energy. Its relationships with consumers and regulators were excellent. Its CEO, David Sokol, was often mentioned as a potential successor to Buffett, although Buffett himself was keeping his cards very close to the vest.

Buffett also used this report to reiterate that he was still down on the dollar, and thought it would decline. The dollar had strengthened since his first article, and now his view was being widely criticized in the financial press. He had reduced his currency bets in favor of buying foreign stocks, but nothing changed his view. And once again, he decried excessive executive compensation. On derivatives, a topic he now covered every year, Buffett wrote:

"Long ago Mark Twain said: 'A man who tries to carry a cat home by its tail will learn a lesson that can be learned in no other way.'...I dwell on our experiences in derivatives each year for two reasons. One is personal and unpleasant. Both Charlie and I knew at the time of the Gen Re purchase that it was a problem and told its management that we wanted to exit the business. It was my responsibility to make sure that happened. Rather than address the situation head-on, however, I wasted several years while we attempted to sell the operation. That was a doomed endeavor, because no realistic solution could have extracted us from the maze of liabilities that was going to exist for decades. Our obligations were particularly worrisome because their potential to explode could not be measured. Moreover, if severe trouble occurred, we knew it was likely to correlate with problems elsewhere in financial markets.

"So I failed in my attempt to exit painlessly, and in the meantime more trades were put on the books." Buffett was referring to a period during which he had hired a new manager, and briefly allowed him to expand the business. Some of these trades later proved costly to unwind. *"Fault me for dithering. (Charlie calls it thumb-sucking.) When a problem exists, whether in personnel or in business operations, the time to act is now.*

"The second reason I regularly describe our problems in this area lies in the hope that our experiences may prove instructive for managers, auditors, and regulators. In a sense, we are a canary in this business coal mine and should sing a song of warning as we expire…General Re was a relatively minor operator in the derivatives field. It has had the good sense to unwind its supposedly liquid positions in a benign market, all the while free of financial or other pressures that might have forced it to conduct the liquidation in a less than efficient manner. Our accounting in the past was conventional and thought to be conservative. Additionally, we know of no bad behavior by anyone involved.

"It could be a different story for others in the future. Imagine, if you will, one or more firms (troubles often

spread) with positions that are many multiples of ours attempting to liquidate in chaotic markets and under extreme, and well-publicized pressures. The time to have considered—and improved—the reliability of New Orleans's levees was before [Hurricane] Katrina."[10]

The general belief, however, continued to be that derivatives spread and reduced risk. In a market shoved upward by cheap debt and derivatives nearly day by day, low interest rates and the "securitization" of mortgages into derivatives were pumping a housing boom that would peak in 2006. By one estimate, total global leverage (debt) had quadrupled in less than a decade.[11] Buffett fretted occasionally that he might never again see the kind of home-run climate for investing that had blessed him in the 1970s. But he never stopped searching, he never stopped delving for ideas.

* * *

One day in 2004 he obtained from his broker a thick book, the size of several telephone directories stapled together. Its pages contained listings of Korean stocks. He had been scouring the global economy, looking for a country, a market, that was overlooked and undervalued. He had found it in Korea. Night after night, he leafed through the tome, studying column after column of numbers, page by page by page. But the numbers and their nomenclature puzzled him. He realized that he needed to learn a whole new language of business that described a different culture of commerce. So he got another book and figured out everything important there was to know about Korean accounting. That would reduce the odds of getting hornswoggled by the numbers.

Once he'd mastered the listings, he began sifting and sorting. It felt something like the old days back at Graham-Newman, when he sat next to the ticker machine clad in his cherished gray cotton jacket. Staring at hundreds of pages of numbers, he could pick out which were important and how they fell into a coherent pattern. Working from a list of several thousand Korean stocks, he quickly pared it down to a workable number; after making some notes on a yellow legal pad he kept going, just as he had when he'd paged through the *Moody's Manual,* looking for the gems amid the dreck—until finally he arrived at a much shorter list.

This winnowed-down list was so short that it could be contained on a single piece of legal-size paper. Sitting down with a visitor, he held out the list, which consisted of at most a couple of dozen companies. A few were large—among the largest in the world—but most were very small.

"Lookit," he said, "*this is how I do it. They are quoted in won. If you go to the Internet and look them up on the Korean stock exchange, they have numbers instead of ticker symbols, and they all end in zero unless it's a preferred stock, in which case you click in five. If they have a second class of preferred, you don't click in six, you click in seven. Every night you can go on the Internet at a certain time and look up some issues and it'll show you the five brokerage firms that would have been the largest buyers and the five that would have been the largest sellers that day. You have to set up a special account with a bank in Korea. That's not easy to do. I'm learning it as I go along.*

"It's like finding a new girl to me.

"These are good companies, and yet they're cheap. The stocks have gotten cheaper than five years ago, and yet the businesses are more valuable. Half of the companies have names that sound like a porno movie. They make basic products, like steel and cement and flour and electricity, which people will still be buying in ten years. They have a big market share in Korea, which isn't going to change, and some of these companies are exporting to China and Japan too. Yet for some reason, they haven't been noticed. Look, this flour company has more than its market value in cash, and it sells at three times earnings. I couldn't buy very much, but I got a few shares. Here's another one, a dairy. I could end up with nothing but a bunch of Korean securities in my personal portfolio.

"Now, I'm no expert on foreign currencies. But I'm comfortable owning these securities denominated in the

won right now.

"The main risk, and part of why the stocks are cheap, is North Korea. And North Korea is a real threat. If North Korea invaded South Korea, the whole world could go to hell. China, Japan, all of Asia would be drawn into a war. The consequences are almost unimaginable. North Korea is very close to having nuclear weapons. I regard it as one of the world's most dangerous countries. But I would make the bet that the rest of the world, including China and Japan, are simply not going to let the situation get to the point that North Korea makes a nuclear attack on South Korea anytime soon.

"When you invest, you have to take some risk. The future is always uncertain. I think a group of these stocks will do very well for several years. Some of them may not do well, but as a group, they should do very well. I could end up owning them for several years."

He had found a new game, a new puzzle to figure out. He wanted more of them and kept looking for opportunities with the same eagerness he'd once shown stooping for winning tickets at the racetrack.

* * *

In December 2005, in a talk at the Harvard Business School, he was asked about his hopes for the Buffett Foundation's impact on society, since it would someday become the best-funded philanthropy in the world. Buffett responded that his guess was that he was not doing society as great a favor by compounding any more. So he was thinking more these days about giving the money away.

Nobody said anything. Nobody seemed to realize that Buffett had just signaled a total shift in direction.

Later, in the same speech, he talked about the Gates Foundation. He admired Bill and Melinda Gates more than any other philanthropists, he said. Theirs was the most rational and best executed of any foundation policy he had ever seen. And he liked that they didn't want publicity for their philanthropy, did not want their name on any buildings.

By early 2006, his thoughts had begun to crystallize. While he was pleased with the job his kids were doing with their own foundations, the sense of safety and security that Big Susie had given him was not duplicable. This emotional force operated beyond a conscious level. His decision to leave her in charge of the money had never been based on a rational or calculated assessment of her qualifications as a philanthropist. With the accretion of a decades-long relationship, he had simply built up layers of personal trust and comfort in his wife's judgment and wisdom. Now that she was gone, everything was different. He mentioned his change of heart to Tom Murphy at Murphy's daughter's wedding. Out of the blue, he told Sharon Osberg. He was going to give the money away early. But he had only an idea, not a plan.

The plan, which was complicated, took months to work out in detail. The following spring, he started telling the people who were directly affected. "Brace yourself," he said when he sat down with Carol Loomis, one of the Buffett Foundation trustees. "The news was indeed stunning," she wrote.[12]

"I got lots of questions," he said about the conversations in which he made this startling announcement, "and some people had qualms about the plan initially because it was such an abrupt change from what they had been anticipating."[13] His sisters, on the other hand, were instantly enthusiastic when they found out. "This is the best idea you've had," wrote Bertie afterward, "since you pretended to have asthma to get sent home from Fredericksburg."[14] Doris—who knew from her Sunshine Lady Foundation how much work it was to give away even a few million dollars intelligently—thought it was a brilliant decision.[15]

On June 26, 2006, Buffett announced that he would give away eighty-five percent of his Berkshire Hathaway stock—worth $37 billion at the time—to a group of foundations over a number of years. No gift of this size had ever been made in the history of philanthropy. Five out of every six shares would go to the Bill and

Melinda Gates Foundation, already the largest charity in the world, in a historic marriage of two fortunes for the betterment of the world.[16] He was requiring that the money be spent as it was given, so that the foundations could not perpetuate themselves. To cushion the shock of losing the money that would someday have made their family foundation the largest in the world, Buffett divided the remaining shares, worth about $6 billion, among his children's individual foundations, each of which would receive shares worth $1 billion, and the Susan Thompson Buffett Foundation, which would receive shares worth $3 billion. None of the children had ever expected their personal foundations to reach such an enormous size, especially not while he was alive. At the date of the gift, the shares handed over in the first year's installment were worth $1.5 billion to the Gates Foundation, $50 million to each of his children's foundations, and $150 million to the Susan Thompson Buffett Foundation. Depending on Berkshire's stock price, those values could vary. As it turned out, they would increase. They would increase a lot.[17]

The man who was, at the time, the second richest person on earth was giving away his money without leaving a trace of himself behind. He had spent all his life rolling up the snowball as if it were an extension of himself; yet he would establish no Warren Buffett Foundation, no Buffett hospital wing, no college or university endowment or building with his name on it. To donate the money without naming something after himself, without controlling personally how it would be spent—to put the money in the coffers of another foundation that he had selected for its competence and efficiency, rather than creating a whole new empire—upended every convention of giving. No major donor had ever done such a thing before. "It was a historic moment in the field of philanthropy globally," said Doug Bauer of Rockefeller Philanthropy Advisors. "It's set a bar, a touchstone, for others."[18]

That Warren Buffett had done this was both surprising and predictable. An unconventional thinker and problem-solver, he was making a gesture against philanthropic waste and grandiosity. The Gates Foundation got its money, but had to spend each installment—and fast. The decision was unusual, highly personal, a form of teaching by example, and—naturally—enormously attention-getting. Meanwhile, in another sense, this was a classic Buffett no-lose deal. He had stunned the world by giving away almost all of his money by earmarking it, yet got to keep most of it until he actually transferred the shares. Nonetheless, in one stroke he had transformed a lifetime of grasping at money by committing to letting go—and had started to disburse it by the billions. The boy who would not let his family touch the chifforobe where he kept his hoarded coins had finally become a man who could entrust his tens of billions to someone else's hands.

In the announcement speech, Buffett said, *"Just over fifty years ago last month, I sat down with seven people who gave me one hundred and five thousand dollars to manage in a little partnership. And those people made the judgment that I could do a better job in amassing wealth for them than they could do themselves.*

"Fifty years after that, I sat down and thought about who could do a better job dispensing the wealth than myself. It's really quite logical. People don't often have that second sit-down. They are always saying, Who should handle my money? and they quite willingly turn their money over to people with a certain expertise. But they don't seem to think about doing that very often in the philanthropic world. They pick their old business cronies or whomever to administer wealth after they're gone, at a time when they won't even be able to observe what's happening.

"So I got very lucky, because philanthropy is harder than business. You are tackling important problems that people with intellect and money have tackled in the past and had a tough time solving. So the search for talent in philanthropy should be even more important than the search for talent in investments, where the game is not as tough."

Buffett then spoke of the Ovarian Lottery. *"I have been very lucky. I was born in the United States in 1930 and won the lottery the day I was born. I had terrific parents, a good education, and I was wired in a way that paid off disproportionately in this particular society. If I had been born long ago or in some other country, my particular wiring would not have paid off the way it has. But in a market system, where capital-allocation wiring is important, it pays off like no other place.*

"All along, I've felt the money was just claim checks that should go back to society. I am not an enthusiast for dynastic wealth, particularly when the alternative is six billion people who've got much poorer hands in life than we have, getting a chance to benefit from the money. And my wife agreed with me.

"It was clear that Bill Gates had an outstanding mind with the right goals, focusing intensely with passion and heart on improving the lot of mankind around the world without any regard to gender, religion, color, or geography. He was just doing the most good for the most people. So when the time came to make a decision on where the money would go, it was a simple decision."

The Gates Foundation followed a basic creed that Buffett shared: "Guided by the belief that every life has equal value," it worked to "reduce inequities and improve lives around the world" in the areas of global health and education. The Gateses saw themselves as "convenors," who brought together the best minds as advisers to work on permanent solutions to enormous problems.[19]

However much Buffett had changed and grown since Susie's death, he was still very much the same in certain ways. Allen Greenberg, who ran the Buffett Foundation, found out that the foundation he would be running would be a $6 billion foundation, not the $45 billion foundation for which he had been preparing, not from Buffett, but by proxy through Allen's new boss and ex-wife, Susie Jr. Warren had been unable to bring himself to confront Greenberg to tell him that all his plans and thinking about how to run the foundation in the future must be downsized. Susie Jr. had to convince Allen that this was in no way a grade on his performance. After his initial explosion over the fact that he hadn't heard the news from the source, he conceded that he would still be administering one of the world's ten largest charitable coffers, and peace ultimately reigned.

All involved had ample reason to behave well. Even though Buffett was giving away a vast sum, the money would be paid out over some years. And the stock he had not yet earmarked as a gift was estimated as worth more than $6 billion at the time. He still had plenty to give away.

The effects of Buffett's announcement were immediate and sizable. Jackie Chan, the Hong Kong actor, announced that he would give away half his wealth. Li Ka-shing, Asia's richest man, pledged a third of his $19 billion to his own charitable foundation. Carlos Slim, the Mexican communications monopolist, ridiculed Buffett and Gates for their philanthropy but, some months later, did a turnabout and announced that he, too, would begin giving money away. And the Gateses set up a new division within their foundation simply to handle people who wanted to make donations to them—such as a seven-year-old girl who sent the Gates Foundation her life savings of $35.

The newly enriched Gates Foundation was having a tectonic impact on the philanthropic world. Its "all-asset approach," which greatly resembled Buffett's ideas about concentration—and, indeed, his investing style—focused resources toward a short, carefully selected list of serious problems. That differed markedly from many other major foundations and community funds, at which a headquarters staff of philanthropoids circled around a series of supplicants, playing "eeny, meeny, miney, moe" as they doled out fragmentary sums. By the end of 2006, certain organizations such as the Rockefeller Foundation had begun modifying their policies to align them more closely with the Gates approach.[20]

Three thousand letters from needy people poured into Buffett's office after the Gates announcement, with more coming every day. They had no insurance and were overwhelmed by medical bills, or they had gotten injured on the job and their homes were being repossessed. Their children had cataclysmic health problems that required special care, which prevented them from making enough money to pay their mortgage. Or their boyfriends had gotten them pregnant, cheated them out of money, tricked them into assuming the boyfriend's debt, and then run off without paying child support. They were the losers in the Ovarian Lottery. Warren forwarded the letters to his sister Doris. Over the past ten years her Sunshine Lady Foundation, funded with the proceeds from Howard Buffett's trust, had helped thousands of victims of domestic violence, the severely disadvantaged, and families in crisis. He enclosed $5 million with the letters to help fund Doris's work.

She hired a group of women over age fifty to help sort out the letters where "bad luck rather than bad choices" had played a part, and relatively small amounts of money could give someone a hand up. They often

gave advice to the gamblers and credit-card addicts and people who just didn't want to work, but they never bailed out people who had other ways to solve their problems. And Doris never paid for everything. "I don't want to be their mommy," she said. She also made them write thank-you letters. Her type of philanthropy taught gratitude and self-respect.[21]

Buffett kept handing out more of his billions. He was already giving $5 million a year to Ted Turner's Nuclear Threat Initiative (NTI), which he considered the most important of the U.S. organizations focused on dealing with the world's nuclear threat, and he was willing to give more. Former Senator Sam Nunn, who ran NTI, had proposed a nuclear-fuel reserve to which countries could turn rather than developing their own nuclear enrichment programs, thereby reducing the likelihood of nuclear proliferation. Buffett felt that this idea had considerable merit, and he pledged $50 million as a matching gift if other funds could be raised. He would make huge amounts of money available to any antinuclear causes that seemed to him able to come up with realistic solutions to the problem.

Buffett also gave a donation to former President Jimmy Carter for the work of the Carter Center. After leaving office an unpopular president, Carter had become an example of someone fallen to the ninety-eighth floor who had looked forward, not back, rising to win the Nobel Peace Prize for his work in global health, democracy, and human rights. "Would love to have you join us in Ghana on Feb. 6–8, 2007," Carter wrote him back warmly after the gift, "to see our guinea worm work."[22] Buffett considered Carter a friend, but *nobody*—not Howie, not Big Susie, not even Bill Gates—could have gotten him on a plane to go see a guinea worm.[23]

Thus, for a third time he avoided a trip to Africa. Some things did not change. But time moved on, and other things did change.

Astrid was now Warren's official companion at events outside Omaha. She remained virtually unchanged—the same plainspoken, unpretentious person—but her world had expanded at stunning speed. She now socialized routinely with Bill and Melinda Gates. In the fall of 2005, she and Warren had flown to Tahiti to attend Bill Gates's fiftieth-birthday party, which took place on Paul Allen's sleek blue-and-white *Octopus,* one of the world's largest yachts. A billionaire's little-boy fantasy that belonged to the world's sixth-richest man, the *Octopus* had a movie theater, a recording studio, two helicopters, a sixty-three-foot tender, and a small submarine that could sleep eight people for two weeks on the ocean floor. She and Warren stayed in Paul Allen's mother's stateroom, a large suite with a walk-in closet and a library in the sitting room. "Oh, my God," says Astrid, "it was unbelievable. I have never experienced and will probably never experience a time like that again."

"It beats home" was Warren's reaction. He returned from the trip talking of the onboard bridge games.[24]

Two years after Susie's death, on his seventy-sixth birthday, Warren married Astrid in an unfussy civil ceremony at Susie Jr.'s house with no guests other than family. Astrid wore a simple turquoise blouse and white pants, and Warren wore a business suit. Tears welled from her eyes as he placed a huge diamond solitaire ring on her finger. Afterward, they went to the Bonefish Grill next to Borsheim's for dinner. Then they flew out to San Francisco for a wedding party and a traditional wedding cake at Sharon Osberg and David Smith's. The Gateses joined them for the celebration.

Warren Buffett, the not-simple man of simple tastes, now had the simple life of the man that he had always believed himself to be. He had one wife, drove one car, occupied one house that hadn't been redecorated in years, ran one business, and spent more and more time with his family.[25]

* * *

Buffett always said that trees don't grow to the sky. But new saplings form.

The question of who would succeed him had long vexed his shareholders.

He sometimes quipped that Berkshire could be run by someone working five hours a week, or by Charlie's bust of Ben Franklin, or by a cardboard cutout. He'd also joked about controlling it after his death: "Well, my backup plan is that I've figured out how to manage the company by seance." No one was fooled by his banter. On other occasions he was just as likely to tell his listeners: "My psyche is all wrapped up in Berkshire." And those who worked for and invested in Berkshire were all wrapped up in Buffett. He was not replaceable. And what would happen to all that capital? The question of either a dividend or a huge share repurchase would arise instantly when he was gone. His successor would have to change some things—for while parts of the Berkshire model should be preserved, other parts should not. The headquarters staff—famously minuscule—would probably grow as outsourced functions were reclaimed. Meanwhile, the presumption continued to be that all of the succession candidates already worked at Berkshire. But that wasn't necessarily true. In fact, the board would be obliged to consider outside candidates when the time came.

Buffett once said that he would be happy if Berkshire was still serving his shareholders thirty years after his death. That was his design. The elegant machine that he had created was built to last more than a generation beyond him. Yet to maintain it would be a remarkable accomplishment; he was the soul of that machine, and without him there would be a vacuum at the center, no matter what. For Buffett was the best there would ever be at the thing that only he could do perfectly, which was to be himself.

No group of shareholders in history had ever missed their CEO as much as Berkshire's shareholders would miss Buffett when he was finally gone. None had ever thought of their CEO as a teacher and a friend the way Buffett's shareholders had thought of him. The man who had made billions had touched thousands of people and had a relationship that felt personal to countless others whom he'd never even met or seen. But oddly enough, no matter how many fan letters Buffett got or how many autographs he signed, he never fully grasped how loved and admired he was. He got as excited about every letter and request for an autograph as though it were the first.

* * *

In July 2007, the Dow hit a new high of 14,000. Then it began to fall. House prices had already peaked, the way every great bubble peaks, partly because the Federal Reserve had finally started raising interest rates, and house prices had been sliding for some time. Unable to refinance, homeowners were defaulting on their mortgages at historically high rates.

The global margin call began in August. Over a period of eight months, the financial world imploded in a credit crisis of historic proportions. Not since the Great Depression had such a severe credit seizure occurred. Not since the Panic of 1907, when old J. P. Morgan himself had personally intervened to orchestrate a solution to the panic, had such extraordinary informal intervention in financial markets taken place as would occur in 2008.

The crisis progressed in fits and starts, with weeks and even months of apparent calm followed by convulsions that left victims scattered like broken shells on a beach. As it turned out, derivatives had indeed spread risk—banks reported tens of billions in losses; a hospital-management company in Australia lost a quarter of its investment portfolio; eight Norwegian towns lost millions on supposedly safe mortgages securities; estimates of total losses ranged from hundreds of billions to as high as $1 trillion from all sources combined. Like Long-Term Capital, the underlying bets were all made in the wrong direction. They had assumed a rational "efficient" market in which a decline in prices would be halted by cool-tempered, calculating buyers.

"They said all these derivatives made the world safer and spread the risk out. But it didn't spread the risk in terms of how people reacted to a given stimulus. Now, you could argue that it might be way better to have that credit with just five banks, who could all work, than to have it with thousands around the globe,

all of whom are going to rush out of it at the same time."

The Federal Reserve cut interest rates once again, and worked with other central banks to activate other emergency sources of financing,[26] yet the credit crisis continued to spread.

The reluctance to lend began to show signs of contagion. The Dow fell seventeen percent, to 11,740, from its October high. With each new announcement of a fire sale, bankruptcy, or collapse, the low rumbling panic grew louder. More people tried to sell assets behind the scenes and found no buyers; more lenders began to call in loans.

On Thursday, March 13, 2008, a run began, this time on Bear Stearns, the weakest of the investment banks, as its lenders started refusing to roll over its loans. In a near re-creation of the Salomon crisis seventeen years earlier, the following day, Friday, Bear nearly collapsed from lack of financing. But this time the Federal Reserve took the unprecedented step of guaranteeing $30 billion of Bear Stearns debt—the first time the Federal Reserve had ever bailed out an investment bank. Bear closed at $30 per share on Friday afternoon. Buffett pondered the situation that evening. Long-Term Capital Management's bailout had been a dress rehearsal—on a much smaller scale—for this moment.

"The speed with which fear can spread—nobody has to have an account at Bear Stearns, nobody has to lend them money. It's a version of what I went through at Salomon, where you were just inches away all the time from, in effect, an electronic run on the bank. Banks can't stand runs. The Federal Reserve hasn't bailed out investment banks before, and that was what I was sort of pleading back there in 1991 with Salomon. If Salomon went, who knows what kind of dominoes would set off. I don't have good answers to what the Fed should do. Some parts of the market are pretty close to paralyzed. They don't want contagion to spread to what they would regard as otherwise sound institutions; if Bear fails and two minutes later, people worry that Lehman fails, and two minutes after that they worry that Merrill will fail, and it spreads from there."

The rational Buffett tried to unlock the puzzle embedded in the risky choices facing the Federal Reserve. It had no really good options. Either it allowed a financial meltdown or it took actions that would promote inflation by adding to downward pressure on the dollar. *"It could all end on a dime if they flooded the system with enough liquidity, but there are consequences to doing that. If dramatic enough, the consequences would be the immediate expectation of huge inflation. A lot of things would happen that you might not like. The economy is definitely tanking. It's not my game, but if I had to bet one way or another —everybody else says a recession will be short and shallow, but I would say long and deep.*

"You absolutely never want to be in a position where tomorrow morning you have to depend on the kindness of strangers in the financial world. I spent a lot of time thinking about that. I never want to have to come up with a billion dollars tomorrow morning. Well, a billion I could. But any significant amount. Because you just cannot be sure of anything. You have to think about things that have never happened before. You always want to have plenty of money around."

All weekend the regulators and bankers toiled, much as they had years earlier on Salomon. This time, however, it was with the almost certain knowledge that the bank's failure would have catastrophic consequences to the global financial system. Whether Bear Stearns deserved its fate was not at issue. Just before the Tokyo markets opened on Sunday, the Federal Reserve announced that it had orchestrated a sale of Bear to investment bank JP Morgan Chase for a pittance. Buffett had been offered the deal, but thought it contained too much open-ended risk.

The same day that the Bear bailout was announced, the Federal Reserve, attempting to calm panic and prevent a run on Lehman Brothers, did indeed begin to flood the system with liquidity: It offered to let the largest investment banks borrow up to $200 billion at its "discount window," using mortgage-backed securities as collateral. Use of the discount window, formerly a privilege restricted to commercial banks, had never before been extended to investment banks, which are not subject to the reporting and capital regulations that are a quid pro quo for such borrowing. The move didn't calm the panic; then the government made the offer open-ended. The government was going to accept bad loans as collateral; it began to take a

variety of once again unprecedented steps to try to unfreeze the mortgage markets and help struggling lenders. Market pundits praised the Fed's rescue of Bear and pump-priming of the investment banks as the only way to prevent contagion, but argued whether these actions would hasten an economic recovery or only prolong the pain and plant the seeds of the next bubble. And for seven months, while these financial disasters were unfolding, the value of the dollar—which had been declining for some time—had continued to slide. Meanwhile, oil prices spiked: By July 2008, spot oil traded at $144 per barrel.

* * *

"It's a weird time. We've gone into a different world, and nobody knows what will happen to the world, but Charlie and I looked at the downside, and nobody else did, very much." Deleveraging could be a painful process in which banks, hedge funds, financial-services companies, municipalities, the construction and travel industries, consumers, and indeed the whole economy withdrew—fast and painfully or slow and painfully—from the intoxicant of cheap debt. Asset returns could well stay subpar for a long time—what Charlie Munger called a "4% return world." Beware of scams and charlatans, said Munger; they might proliferate because the easiest way to turn four percent into sixteen percent is thievery.

In the midst of all the chaos of the spring of 2008, there sat Buffett, whose thinking about value and risk had not changed in the nearly sixty years of his career. There are always people who say that the rules have changed. But it only looks that way, he said, if the time horizon is too short.

There was Buffett, stooping for cigar butts as if he were a child again. He took no joy from others' pain, but in the business of life, everyone chooses a side to play. Times like these brought out his sharpest skills, the joy of doing what he loved most, true to himself. *"We're selling some credit default swaps [insurance against firms going bankrupt] in situations where it is underpriced. I'm sitting here with my newest daily paper that I read, the Bond Buyer, on my lap. Who the hell would have thought that I'd be reading the Bond Buyer every day? The Bond Buyer costs $2,400 a year. I felt like asking for a daily subscription rate. We get these bid lists on failed auctions of tax-exempt money-market funds and other auction rate bonds and have been just picking them off. The same fund will trade at the same time on the same day from the same dealer at interest rates of 5.4 percent and 8.2 percent. Which is crazy, they're the exact same thing, and the underlying loans are perfectly good. There is no reason why it should trade at 820, but we bid 820 and we may get one, while concurrently someone else buys exactly the same issue at 540. If you'd told me ten weeks ago I'd be doing this, I'd have said that's about as likely as me becoming a male stripper. We've put $4 billion into this stuff. It's the most dramatic thing I've seen in my life. If this is an efficient market, dictionaries will have to redefine 'efficient.'"*

Who would think that tax-exempt money-market funds could become cigar butts?

"But the most immediate and doable opportunity is weird things in the credit market. And the biggest opportunity is in mortgages. But I don't understand them well enough, although I'm learning them so that I can understand them. And if I think I've got enough margin of safety, I'll do it." But the average person should not do it.

"No. Stocks are the things to own over time. Productivity will increase and stocks will increase with it. There are only a few things you can do wrong. One is to buy or sell at the wrong time. Paying high fees is the other way to get killed. The best way to avoid both of these is to buy a low-cost index fund, and buy it over time. Be greedy when others are fearful, and fearful when others are greedy, but don't think you can outsmart the market.

"If a cross-section of American industry is going to do well over time, then why try to pick the little beauties and think you can do better? Very few people should be active investors."

If there is any lesson the life of Warren Buffett has shown, it is the truth of that.

* * *

Trees don't grow to the sky, but Buffett felt he could help new saplings take root. He never lost his focus on business, but as he contemplated the ideal way to spend the rest of his life, once again he was roused by the urge to preach. For some time he had been giving talks to college students around the United States, traveling to their schools, welcoming them to Omaha. He liked talking to students because they were not hardened in their habits, still young enough to take full advantage of what he said.

"I packed my little snowball very early, and if I had packed it ten years later, it would have been way different than where it stands on the hill right now. So I recommend to students that if you start out a little ahead of the game—it doesn't have to be a lot, but it's so much better than starting out behind the game. And credit cards really get you behind the game."

As early as 2002, feeling a sense of urgency, he had begun to pick up speed with his talks to the students. They came from MIT. Northwestern. The University of Iowa. The University of Nebraska. Wesleyan. The University of Chicago. Wayne State. Dartmouth. The University of Indiana. The University of Michigan. Notre Dame. Columbia. Yale. The University of Houston. Harvard/ Radcliffe. The University of Missouri. The University of Tennessee. UC Berkeley. Rice. Stanford. Iowa State. The University of Utah. Texas A&M University. Much of his message was that getting rich quick wasn't the worthiest goal in life. Ironically, it was his own competitiveness and the urge of humankind to worship the rich and famous that made his audience seek him out to hear these words. Like everything else in his life, the visits from students started to snowball.

In 2008, he was crowned the richest man on earth for the first time. By then, the students were coming from Asia, from Latin America, arriving in Omaha in groups of two or three schools at a time, in packs sometimes of more than two hundred, sometimes on several days a month.

The students who made the pilgrimage to visit the Sage of Omaha got the full treatment (excepting only that Buffett did not go to their hotels in person and leave bound volumes of his annual reports for them at the front desk at four-thirty a.m. The Internet now did that job for him). They toured Rose Blumkin's Nebraska Furniture Mart and roamed the aisles of Borsheim's. Buffett met them in the office. Some days now, he abandoned his gray suits and tight collars, and looked relaxed in casual dress. Their questions often ventured far afield from business. What is the purpose of life? some of them wanted to know. He answered this question the same way he answered the business ones—in mathematical terms.

As he had told the students at Georgia Tech when Susie was in the hospital, recovering from her surgery: *"The purpose of life is to be loved by as many people as possible among those you want to have love you."*

How should society be ordered? He told them about the Ovarian Lottery. How do I find the right spouse? Marry up, he said. (He wasn't talking about money.) How do I know what is right? Follow your Inner Scorecard. What should I do about a career? Find something you are passionate about. I only work with people I like. If you go to work every morning with your stomach churning, you're in the wrong business.

He told them about the genie. Treat your body like the only car you'll ever own: Baby that car, garage it every night, buff every dent, and change its oil every week. Then he took them out to lunch or dinner at Gorat's and everyone scarfed down salty T-bones and double hash browns at the scuffed linoleum tables as if the genie had exempted them temporarily from his rules. As they ate, they would leap up, one after another, and jockey to have a picture taken with Warren Buffett. Someday, maybe in forty years, their grandchildren would believe them when they claimed to have talked and sat and dined with the Oracle of Omaha.

What he was teaching were the lessons that had emerged from the unfolding of his own life.

In that unfolding, he admits to ambition, but he denies that there was ever a plan. He finds it hard to acknowledge his own powerful hand as the creator of the sweeping canvas that is his masterpiece. As he tells the story, a series of happy accidents built Berkshire Hathaway; a moneymaking machine sprang up without design. Its elegant structure of true partnership with like-minded shareholders built on what Munger called a

"seamless web of deserved trust," with an investment portfolio buried inside an interlocked set of businesses whose capital could be moved at will, all of them turbocharged with "float"—all this had come about, he claims, simply as a reflection of his personality. The final product was a model that could be analyzed and understood, yet few did and, for the most part, nobody coattailed it. What people paid attention to was simply how rich he was. Indeed, as much as he wanted them to study his model, Buffett sometimes inadvertently discouraged it; he also wanted people to believe that he just tap-danced into work every day and had fun.

But that would be the less flattering version.

The truth is this.

When Warren was a little boy fingerprinting nuns and collecting bottle caps, he had no knowledge of what he would someday become. Yet as he rode his bike through Spring Valley, flinging papers day after day, and raced through the halls of The Westchester, pulse pounding, trying to make his deliveries on time, if you had asked him if he wanted to be the richest man on earth—with his whole heart, he would have said, *Yes.*

That passion had led him to study a universe of thousands of stocks. It made him burrow into libraries and basements for records nobody else troubled to get. He sat up nights studying hundreds of thousands of numbers that would glaze anyone else's eyes. He read every word of several newspapers each morning and sucked down the *Wall Street Journal* like his morning Pepsi, then Coke. He dropped in on companies, spending hours talking about barrels with the woman who ran an outpost of Greif Bros. Cooperage or auto insurance with Lorimer Davidson. He read magazines like the *Progressive Grocer* to learn how to stock a meat department. He stuffed the backseat of his car with *Moody's Manuals* and ledgers on his honeymoon. He spent months reading old newspapers dating back a century to learn the cycles of business, the history of Wall Street, the history of capitalism, the history of the modern corporation. He followed the world of politics intensely and recognized how it affected business. He analyzed economic statistics until he had a deep understanding of what they signified. Since childhood, he had read every biography he could find of people he admired, looking for the lessons he could learn from their lives. He attached himself to everyone who could help him and coattailed anyone he could find who was smart. He ruled out paying attention to almost anything but business—art, literature, science, travel, architecture—so that he could focus on his passion. He defined a circle of competence to avoid making mistakes. To limit risk he never used any significant amount of debt. He never stopped thinking about business: what made a good business, what made a bad business, how they competed, what made customers loyal to one versus another. He had an unusual way of turning problems around in his head, which gave him insights nobody else had. He developed a network of people who—for the sake of his friendship as well as his sagacity—not only helped him but also stayed out of his way when he wanted them to. In hard times or easy, he never stopped thinking about ways to make money. And all of this energy and intensity became the motor that powered his innate intelligence, temperament, and skills.

Warren Buffett was a man who loved money, a man for whom the game of collecting it ran in his veins as his lifeblood. That love kept him going: buying little stocks like National American, selling GEICO to have the money to buy something cheaper, pushing at the boards of companies like Sanborn Map to do the right thing for shareholders. It had made him independent and competitive enough to want his own partnership and say no to the chance to be a junior partner running Ben Graham's old firm. It made him tough enough to shut down Dempster's distribution center and fire Lee Dimon; it gave him the determination to break Seabury Stanton. It had tamed his impatience and made him listen when Charlie Munger insisted that they buy great businesses, even though listening to other people went against his very grain. It stiffened his will to survive the SEC investigation of Blue Chip and to break the strike at the *Buffalo News*. It made him an implacable acquirer. It also led him to lower his standards from time to time when his turf dried up. Yet it saved him from serious losses by keeping him from abandoning his margin of safety.

Warren Buffett was a timid man who shied from confrontation and needed people to cushion him from life's rougher edges. His fears were personal, not financial; he was never timid when it came to money. His passionate yearning to be rich gave him the courage to ride his bicycle past the house with the awful dog and throw those last few newspapers in Spring Valley. It sent him to Columbia, seeking Ben Graham, after

Harvard turned him down. It made him put one foot in front of the other, calling on people as a prescriptionist, while they rejected him over and over. It gave him the strength to return to Dale Carnegie after losing his courage the first time. It forced him through the decisions in the Salomon crisis to make his great withdrawal from the Bank of Reputation. It lent him the dignity to face years of almost intolerable criticism without counterattacking during the Internet bubble. He had spent his life contemplating, limiting, and avoiding risk, but in the end he was braver than he realized himself.

Warren Buffett would never call himself courageous; he would cite his energy, focus, and rational temperament. Above all, he would describe himself as a teacher. All his adult life he had sought to live up to the values instilled in him by his father: He said that Howard taught him that the "how" mattered more than the "how much." To hold his ruthlessness in check wasn't an easy lesson for him. It helped that he was fundamentally honest—and that he was possessed by the urge to preach. "He deliberately limited his money," says Munger. "Warren would have made a lot more money if he hadn't been carrying all those shareholders and had maintained the partnership longer, taking an override." Compounded over thirty-three years, the extra money would have been worth many billions—tens of billions—to him.[27] He could have bought and sold the businesses inside Berkshire Hathaway with a cold calculation of their financial return without considering how he felt about the people involved. He could have become a buyout king. He could have promoted and lent his name to all sorts of ventures. "In the end," says Munger, "he didn't want to do it. He was competitive, but he was never just rawly competitive with no ethics. He wanted to live life a certain way, and it gave him a public record and a public platform. And I would argue that Warren's life has worked out better this way."[28]

It was the will to share what he knew in an act of sheer generosity that made him spend months writing his annual letter to the shareholders; his joy in showmanship that made him want a mobile home at his shareholder meeting; his pixieish sense of fun that led him to endorse a mattress. It was his Inner Scorecard that made him cling to his margin of safety. It was pure love that turned him into what Munger called "a learning machine." It was his handicapping skill that let him use that knowledge to figure out what the future might bring. It was his urge to preach that made him want to warn the world of dangers to come.

* * *

When Warren reached his seventy-seventh birthday, he mused that he had lived one-third of the lifespan of the United States. His age weighed on him; it was getting harder for him to read all day long the way he used to, since one of his eyes was getting a little weak. So he read more efficiently. He had finally given in and agreed to wear hearing aids. His voice turned gravelly faster than it once did. He tired more easily. But his business judgment was still quick and sharp.

He wished he could have the next ten years' worth of newspapers delivered to his doorstep right now. The years ahead weren't endless, but with luck they could be long. Trees don't grow to the sky, but he wasn't scraping the horizon yet. Another new person, another investment, another idea always waited for him. The things left to learn far exceeded what he already knew.

"The snowball just happens if you're in the right kind of snow, and that's what happened with me. I don't just mean compounding money either. It's in terms of understanding the world and what kind of friends you accumulate. You get to select over time, and you've got to be the kind of person that the snow wants to attach itself to. You've got to be your own wet snow, in effect. You'd better be picking up snow as you go along, because you're not going to be getting back up to the top of the hill again. That's the way life works."

The snowball he had created so carefully was enormous by now. Yet his attitude toward it remained the same. However many birthdays lay ahead, he would always be astonished each time the calendar turned, and as long as he lived, he would never stop feeling like a sprout. For he wasn't looking backward to the top of the hill. It was a big world, and he was just starting out.

Afterword

On October 23, 2006, Berkshire Hathaway became the first American stock to trade above $100,000 per share. By the end of 2007, BRK traded above $140,000 per share, which valued Berkshire as a company at more than $200 billion. Berkshire was the world's most respected company, according to a *Barron's* survey.[1] Buffett's personal fortune exceeded $60 billion.

For a decade, BRK stock had compounded at slightly over twelve percent—a rate that some might compare unfavorably to Buffett's early years, when he achieved an average twenty-seven percent return. Trees don't grow to the sky, he always said; as Berkshire's capital grew, the climb would get steeper. But investors in Berkshire had only gratitude for the "lower" returns. Those who bought an index of the market had just suffered through what the *Wall Street Journal* called a "lost decade" in which the S&P 500 index had gone exactly nowhere, falling below its level of April 1999.[2] Buffett's talk at Sun Valley was unfolding along the lines he had discussed; the period after the 1999 stock market bubble had burst was now the third-longest stretch in the past hundred years when the market made no progress. Buffett still said that stocks are the best long-time investment—as long as they were bought at the right price, and for a low fee. As of early 2008, he was buying stocks, but not with great enthusiasm. Sooner or later the market's weighing machine would catch up with its voting machine. In the meantime, he continued to mostly buy businesses.

Buffett had added several new directors to the Berkshire board since Bill Gates and Charlotte Guyman. In the 2002 chairman's letter he had invited shareholders to nominate themselves for the director position. The letters had come pouring in, and Buffett—of course—collected them; he was amused, entertained, and in a few instances impressed by the people who'd nominated themselves. Still, in the end, he had added Don Keough and Tom Murphy that year instead of a self-nominated candidate. The process had revealed, however, the highly personal—to say the least—corporate governance at Berkshire. Berkshire had agreed, in response to an SEC request, to adopt a formalized process for shareholders to nominate directors. In 2007, Berkshire added another woman, Yahoo! chief financial officer Susan Decker, to his board, again tilting the board demographic to a younger age.

Along the way, Buffett had found that he liked the idea of advertising for people to nominate themselves for jobs. He had always preferred that people ask him for things, rather than the other way around. In his 2006 letter to shareholders, prodded by Bill Gates, he had pointed out that Lou Simpson's "top-notch" record was at risk if anything happened to both Simpson and himself, and advertised for a successor to Simpson. Send in your résumé, Buffett said. The number one thing he and Munger were looking for was somebody who understood risk. Seven hundred proposals arrived from all over the world. One person explained, "I am said to be selfish and also ruthless" various people went on at length—great length—about why they felt they were cut from the same cloth as Buffett—without giving any real qualifications for the job; and many, many people wrote saying they had no requisite experience, but wanted to be Buffett's apprentice, understudy, or protégé. He collected all these letters in huge boxes in the boardroom before eventually filing them away. In the end he chose four candidates who were already successful and managing money; they now waited in the wings.

* * *

After the awkward 2004 shareholder meeting, Buffett moved the business section of the meeting to late in the afternoon in 2005. That year, and in 2006, no activists had shown up. But just before the 2007 meeting, a billboard appeared hovering over a major freeway in Omaha that said "Will your conscience let you off on a technicality?" The question referred to a proposed resolution to force Berkshire to sell its PetroChina investment; PetroChina's parent company, Chinese National Petroleum Company (CNPC), was implicated in funding Chinese sponsorship of genocide in Darfur. While not required to put the resolution on the ballot,

Buffett did so, and allowed a vigorous airing of the Darfur issue at the shareholder meeting.

The supervoting provisions of the A shares meant that the resolution could never pass, but Buffett cared deeply what his shareholders thought of him and the company. The question was mooted when, by the end of 2007, for reasons that he said were unrelated to the Darfur question, Buffett sold the PetroChina investment. It had cost Berkshire just under $500 million; the company netted a profit of $3.5 billion. Energy prices continued to soar afterward, and he was accused of selling too soon. Meanwhile, the shareholder meetings remained a model of decorum; more protestors had begun to arrive at the microphone, where they were greeted respectfully. Then the festival went on.

* * *

Berkshire had bought a number of other new businesses. The most significant included Iscar, a highly automated Israeli maker of metal cutting tools, in 2006, Berkshire's first acquisition of a non-U.S. company. For Fruit of the Loom, he bought Russell Athletics. He took control of Equitas, assuming the old claims of Lloyd's of London in exchange for $7 billion worth of insurance float. Berkshire also bought electronics distributor TTI. In 2007, Buffett invested in the stock of BNSF (Burlington Northern Santa Fe) railroad, setting off a minor frenzy for railroad stocks. One investment that Buffett did not make was in the *Wall Street Journal.* He had never owned stock in his favorite newspaper by 2007 when press lord Rupert Murdoch offered to buy it. Some *Journal* editors and staffers hoped that Buffett would save the paper in the cause of quality journalism. But he would not pay a premium price for a rich man's trophy, even to become the savior of quality journalism. Long ago, in the days of the *Washington Monthly,* the unsentimental side of Buffett had divorced his fondness for journalism from his wallet. Nothing had changed that.

In 2008, candymaker Mars, Inc. announced that it was buying Wm. Wrigley Jr. Company for $23 billion. Buffett had agreed, through Berkshire, to lend $6.5 billion as part of the deal, in an arrangement facilitated by Byron Trott, his investment banker at Goldman Sachs. Trott had been responsible for several of Berkshire's acquisitions. He understood how Buffett thought, and Buffett said that he had Berkshire's interests at heart. "I've been conducting a seventy-year taste test," Buffett said about Wrigley's. The Wrigley deal harkened back to the old days when he had refused to sell a single stick of gum to Virginia Macoubrie.

Buffett's first thought after agreeing to make the loan—of course—had been to call Kelly Muchemore Broz and ask her to set aside a little space at the Berkshire meeting, in case Mars and Wrigley wanted to sell some products to his shareholders. The shareholder meeting turned into a mini-festival of candy and chewing gum. Attendance set a new record; 31,000 people came.

Also in 2008, Berkshire had acquired Marmon, a small industrial conglomerate that made electrical components, railroad tank cars and containers, truck flatbeds, industrial equipment and materials, and the like, with revenues of $7 billion. The seller was the Pritzker family, which had decided to break up its conglomerate to settle family squabbling that had broken out after the death of Buffett's old coattailing hero Jay Pritzker in 1999.

* * *

Buffett had seen many examples of family squabbles among the rich when the patriarch died; he was comfortable that his own arrangements would prevent that. Little squabbling was going on within the Buffett family in the wake of Susie's will and the gift to the Gates Foundation. Howie and Susie Jr. were doing what they loved: farming and giving money away. Peter was in discussions with Robert Redford to bring *Spirit: The Seventh Fire* to Redford's Sundance resort as an annual summer event. He was also in talks with sponsors in Germany and in China about overseas tours of the show, and was about to release his latest CD, *Imaginary Kingdom.*

The one exception to the harmony was Buffett's adopted granddaughter Nicole Buffett. In 2006 Nicole had

participated in Jamie Johnson and Nick Kurzon's documentary *The One Percent,* a story about the children of the rich. In the documentary, Nicole unwisely positioned herself as a spokesman for the unspoiled Buffett way of life. The documentary, which appeared shortly before Buffett's donation to the Gates Foundation, resulted in follow-up appearances on CNN, National Public Radio, and an invitation to appear on an *Oprah* episode about social class in America. Buffett's reaction was harsh; he had sent word to Nicole that he didn't consider her his granddaughter, and if asked, would say so. Nicole told Oprah, "It's a weird thing to be working for a very wealthy family considering I do come from one of the wealthiest families in America." She said she was "at peace with" not having inherited wealth—apparently a reference to the small amounts that Susie had left her grandchildren—but added, "I do feel that it would be nice to be involved with creating things for others with that money and to be involved in it. I feel completely excluded from it." The "poor little me" aspect of her interview was her second mistake.

Afterward, she sent Buffett a letter asking why he had disavowed her. In August 2006, he wrote back[3] offering her good wishes, told her that she had reason to be proud of her accomplishments, and gave her some worthwhile advice. Positioning herself with people as a member of the Buffett family was a mistake, he wrote. *"If you do so, it will become your primary identity with them. People will react to you based on that 'fact' rather than to who you are or what you have accomplished."* He also wrote, *"I have not legally or emotionally adopted you as a grandchild, nor have the rest of my family adopted you as a niece or cousin…. It is simply a fact that just as [your mother] is in no respect my daughter-in-law, her children are not my grandchildren."*

Despite the controlled tone of the letter, Nicole had wounded him in his most tender spot—his identity and that of his family. Otherwise, he might have thought twice about sending the letter, which backfired badly on him. Nicole may have been wrong, but she seemed sincere. Instead of reining her in, the rejection letter set her off on another round of interviews that made Buffett look like Ebenezer Scrooge; one result was a Page Six story in the *New York Post* ("Buffett to Kin: You're Fired!")[4] portraying him as taking vengeance on her for participating in the documentary. To the man who had worked so hard for a lifetime never to alienate anyone, it was a painful irony—but perhaps the story would have a happier ending someday. Buffett had been able to make up with Mrs. B; he could make up with anybody who wanted to make up with him, given enough time.

* * *

By 2008, Coca-Cola's stock was up forty-five percent from its low, to $58. Profits had risen steadily under CEO Neville Isdell. He had settled the Department of Justice investigation and closed a $200 million discrimination lawsuit over racial bias. Buffett left the board in February 2006. His last Coca-Cola shareholder meeting had been another carnival of activists, but nobody had to be wrestled to the floor, and the tension was set to a lower thermostat. In 2007, Isdell had announced that he was retiring. The new CEO, Muhtar Kent, was responsible for the company's successful push into non-cola drinks, where Coca-Cola had been lagging and was strategically off course.

"I always used to tell Gates that a ham sandwich could run Coca-Cola. And it was a damn good thing, too, because we had a period there a couple of years ago where, if it hadn't been that great of a business, it might not have survived."

* * *

General Re, Berkshire's other problem-child investment, had benefited from favorable insurance markets after September 11. It reported the most profitable results in its history in 2007, with $2.2 billion of pretax operating earnings.[5] By then Gen Re had earned back the losses and restored its balance sheet to a better condition than when Buffett bought it. From $14 billion of float at the end of 1998, a decade later General Re had $23 billion of float and $12.5 billion of capital. It was operating with nearly one-third fewer employees

and the company had been transformed.[6] Since 2001, General Re had produced a 13.4 percent annualized return on capital; a number that would be higher, CEO Joe Brandon noted in a letter to Buffett, were it not for "a number of infamous legacy issues."[7] These included $2.3 billion of losses related to insurance and reinsurance sold in prior years, and $412 million of charges for the run-off of Gen Re Securities, the company's derivatives unit. Nevertheless, General Re had escaped the fate of Salomon and overcome the stigma of its Scarlet Letter. Buffett was finally able to praise it and its senior managers in some depth in his 2007 shareholder letter, saying "the luster of the company has been restored" by "doing first-class business in a first-class way."[8]

One large and lingering trace of General Re's former problems remained. Its last act of ignominy before the change of management in 2001 had been to create a Salomon-type scandal of its own in which it broke Buffett's rule of not "losing reputation for the firm." This was the event that would, as it unfolded, adjust Buffett's perception to the new legal enforcement environment, in which showing extreme contrition and cooperation produced no advantage in how a company was treated by prosecutors. Extreme contrition and cooperation were now the expected minimum standard—in part because of Salomon. Anything short of that—for a company to defend itself or its employees, for example—could be considered grounds for indictment.

General Re had become entangled in legal and regulatory problems when New York Attorney General Eliot Spitzer started investigating the insurance industry over "finite" reinsurance in 2004. "Finite" reinsurance has been defined in many ways, but, put simply, it is a type of reinsurance used by the client mainly for financial or accounting reasons—either to bolster its capital or to improve the amount or timing of its earnings. While usually legal and sometimes legitimate, finite reinsurance had been subject to such widespread abuse that accounting rulemakers have spent decades trying to rein it in.

Before working on Wall Street, I was one of those trying to rein it in, as a project manager at the Financial Accounting Standards Board, the primary accounting rulemaker. I helped to draft rules that specify how to account for finite reinsurance. After leaving the FASB, I became a financial analyst. While working at PaineWebber, I covered the stock of General Re at the time it was acquired by Berkshire Hathaway. I first met Warren in connection with the acquisition, and subsequently began to cover Berkshire. Warren had not previously spoken with Wall Street analysts, but he made an exception for me. He told the *New York Times* that he liked the way I thought and wrote.

In 2003, after I started working on this book, both General Re and Ajit Jain's Berkshire Re were condemned in a special investigation for selling finite reinsurance that allegedly contributed to the collapse of an Australian insurer, HIH.[9] Two years later, General Re was accused of fraud by insurance regulators and policyholders in connection with the failure of a Virginia medical malpractice insurer, the Reciprocal of America. While the Department of Justice investigated the allegations extensively, no charges were brought against Gen Re or any of its employees.[10] That same year, Eliot Spitzer's investigation of the insurance industry prompted an investigation by Berkshire's law firm, Munger, Tolles & Olson, which discovered that six employees, including General Re's former CEO, Ron Ferguson, and its former chief financial officer, Elizabeth Monrad, had allegedly conspired with a customer, AIG, to aid and abet an accounting fraud. The alleged fraud was executed through a reinsurance transaction designed to deceive investors and Wall Street analysts (including me) by transferring $500 million in reserves to AIG to window-dress AIG's balance sheet. In June 2005, two of the alleged conspirators, Richard Napier and John Houldsworth, plea-bargained and testified for the prosecution, while five others—four senior managers from Gen Re and one from AIG—were indicted on conspiracy and fraud charges.

The trial, conducted in federal court in Hartford, Connecticut, in January and February 2008, was noteworthy for the prosecution's use of taped telephone conversations in which several of the defendants had repeatedly discussed the transaction in colorful terms. The defendants invoked the "Buffett defense," saying that Buffett had approved the outlines of the structured transaction and was involved in setting the fee. Buffett was not charged with any wrongdoing, and prosecutors said he was not involved. General Re's CEO Joseph Brandon, who was listed among various unindicted co-conspirators in the case, was repeatedly cited by the defendants' lawyers as having knowledge of the deal. He had cooperated with federal prosecutors without asking for

immunity. General Re chief operating officer Tad Montross was also named by the defendants as having knowledge of the transaction. Neither he nor Buffett, however, was listed among the unindicted co-conspirators. None of the three men testified in the case.

I was subpoenaed by the prosecution as both a fact witness and expert and testified that I would "almost certainly" have not upgraded AIG to a "strong buy" in early 2000 had I known the company's true financial position. Under cross-examination I testified about my acquaintance with all of the defendants. I know some of them better than others, but have always had high regard for all of them. I also testified about my relationship with Warren, that I was writing this book, and that Joe Brandon has been a close friend since 1992. I wasn't asked about Tad, but I'm also acquainted with him.

In February 2008, all five defendants were convicted on all counts in the indictment. They face sentencing as this book goes to print; the potential sentences range up to life imprisonment, although the odds seem to be that the terms will be much lower than that. The convicted defendants have said that they will appeal.

Currently I am also under subpoena from former AIG CEO Hank Greenberg in a related case brought against him by the New York Attorney General's office. At this writing, Berkshire Hathaway has settled with neither the SEC nor the Department of Justice. In April 2008, General Re's CEO Joe Brandon resigned to help facilitate a settlement between the company and government authorities.

Accordingly, I cannot comment further on the case at this time. Warren Buffett's personality, however, is laid out in this book; readers should be able to form their own opinion about whether he would participate in or condone the aiding and abetting of a fraud committed by a customer of Berkshire Hathaway.

Finally, New York Governor Eliot Spitzer, who launched the investigation, resigned only a month after the defendants in the AIG trial were convicted, following revelations that he patronized the prostitutes of an escort service called the Emperor's Club.

Notes

Chapter 1

1. This quote, or its variation, "Behind every great fortune there is a great crime," is cited endlessly without a specific source: for example, in Mario Puzo's *The Godfather* and in commentary on *The Sopranos* and on the Internet bubble. This pithier version condenses what Honoré de Balzac actually wrote in *Father Goriot*: "The secret of a great success for which you are at a loss to account is a crime that has never been found out, because it was properly executed."

Chapter 2

1. Herbert Allen made an exception for Ken Auletta, the first and only time a writer was allowed to attend and write about Sun Valley. "What I Did at Summer Camp" appeared in the *New Yorker,* July 26, 1999.

2. Interview with Don Keough. Other guests commented on Buffett's role at Sun Valley as well.

3. Except Donald Trump, of course.

4. Dyan Machan, "Herbert Allen and His Merry Dealsters," *Forbes,* July 1, 1996.

5. Elephant herds are matriarchal, and the females eject the males from the herd as soon as they are old enough to become dominant and aggressive. Then the solitary males approach herds of females, trying to mate. However, this isn't exactly the way human elephant-bumping works.

6. Allen & Co. does not release the numbers, but the conference was said to cost around $10 million, more than $36,000 per invited family. Whether $5 or $15 million, that pays for a lot of fly-fishing and golf over the course of a long weekend. Much of the money pays for the conference's exhaustive security and logistics.

7. Buffett likes to tell a joke about having worked his way up to this exalted state: starting from a trailer, then the lodge, then a lesser condo, and so forth.

8. Herbert Allen's son Herbert Jr. is usually referred to as "Herb." However, Buffett refers to Herbert Sr. as "Herb" as a mark of their friendship, as do a few other people.

9. This portrait of Sun Valley and the impact of the dotcom billionaires is drawn from interviews with a number of people, including investment managers with no ax to grind. Most asked not to be named.

10. Allen & Co. and author estimate. This is the total assets under management of money managers who attend the conference, added to the personal fortunes of the guests. It represents their total economic power, not their consumption of wealth. By comparison, the capitalized value of the U.S. stock market at the time was about ten trillion dollars.

11. $340,000 per car in Alaska, Delaware, Hawaii, Montana, New Hampshire, both Dakotas, Vermont, Wyoming, and throw in Washington, D.C., to boot (since the District of Columbia is not a state).

12. Interview with Herbert Allen.

13. Buffett had spoken twice before at the Allen conference, in 1992 and 1995.

14. Buffett and Munger preached plenty to their shareholders at Berkshire Hathaway annual meetings, but this preaching to the choir doesn't count.

15. Al Pagel, "Coca-Cola Turns to the Midlands for Leadership," *Omaha World-Herald,* March 14,1982.

16. Buffett's remarks have been condensed for readability and length.

17. PowerPoint is the Microsoft program most often used to make the slide presentations so ubiquitous in corporate America.

18. Interview with Bill Gates.

19. Corporate profits at the time were more than 6% of GDP, compared to a long-term average of 4.88%. They have since risen to over 9%, far above historic standards.

20. Over long periods the U.S. economy has grown at a real rate of 3% and a nominal rate (after inflation) of 5%. Other than a postwar boom or recovery from severe recession, this level is rarely exceeded.

21. American Motors, smallest of the "Big Four" automakers, sold out to Chrysler in 1987.

22. Buffett is speaking metaphorically here. He admits to investing in things with wings a time or two, and not with good results.

23. Buffett first used this story in his 1985 chairman's letter, citing Ben Graham, who told the story at his tenth lecture in the series Current Problems in Security Analysis at the New York Institute of Finance. The transcripts of these lectures, given between September 1946 and February 1947, can be found at http://www.wiley.com//legacy/products/subject/finance/bgraham/ or in Benjamin Graham and Janet Lowe, *The Rediscovered Benjamin Graham: Selected Writings of the Wall Street Legend.* New York: Wiley, 1999.

24. A condensed and edited version of this speech was published as "Mr. Buffett on the Stock Market,"

Fortune, November 22, 1999.

25. PaineWebber-Gallup poll, July 1999.

26. Fred Schwed Jr., *Where Are the Customers' Yachts? or, A Good Hard Look at Wall Street.* New York, Simon & Schuster, 1940.

27. Interview with Bill Gates.

28. Keynes wrote: "It is dangerous…to apply to the future inductive arguments based on past experience, unless one can distinguish the broad reasons why past experience was what it was," in a book review for Smith's *Common Stocks as Long-Term Investments* in *Nation and Athenaeum* in 1925 that later became the preface for Keynes, *The Collected Writings of John Maynard Keynes. Vol. 12, Economic Articles and Correspondence; Investment and Editorial*. Cambridge: Cambridge University Press, 1983.

29. The comedian Mort Sahl used to end his routine by asking, "Is there anyone I haven't offended?"

30. According to a source who overheard them and would rather remain nameless.

31. Interview with Don Keough.

Chapter 3

1. Interview with Charlie Munger.

2. Parts of Munger's explanation are taken from three lectures on the psychology of human misjudgment, and his commencement address to the Harvard School on June 13, 1986, both as found in *Poor Charlie's Almanac, The Wit and Wisdom of Charles T. Munger,* edited by Peter D. Kaufman. Virginia Beach, Va.: Donning Company Publishers, 2005. The rest is from interviews with the author. Remarks have been edited for brevity and clarity.

3. Interview with Charlie Munger.

4. Munger's driving habits are described in Janet Lowe, *Damn Right! Behind the Scenes with Berkshire Hathaway Billionaire Charlie Munger*. New York: John Wiley & Sons, 2000.

5. Required to produce a doctor's note to prove he was blind in one eye and qualified for a special license at the California Department of Motor Vehicles, Munger refused and offered to take out his glass eye instead.

6. Munger's doctor used an older type of surgery that had a higher complication rate. Rather than blame the doctor, Munger claims he should have done more research on doctors and types of surgery himself.

7. Buffett's interest in such products as pig stalls and egg counters is limited; he reviews some of these statistics in a summarized form.

8. Despite the complaints of passengers, Buffett has never, to the author's knowledge, been responsible for an accident, only near heart attacks.

9. Beth Botts, Elizabeth Edwardsen, Bob Jensen, Stephen Kofe, and Richard T. Stout, "The Cornfed Capitalist," *Regardie's,* February 1986.

Chapter 4

1. Buffett predicted up to 6% growth in the market per year, but gave historical ranges of no growth, and the underlying math suggested that figure could be high. The 6% was a hedged bet.

2. S&P is Standard & Poor's Industrial Average, the most widely used measure of the overall stock market's performance. S&P includes reinvested dividends. Berkshire does not pay a dividend. All numbers are rounded.

3. "Toys 'R' Us vs. eToys, Value vs. Euphoria," Century Management, http://www.centman.com/Library/Articles/Aug99/ToysRUsvsEtoys.html. In March 2005, Toys "R" Us agreed to a takeover offer from private equity firms Kohlberg Kravis Roberts & Co., Bain Capital, and real estate group Vornado Realty Trust in a deal valued at $6.6 billion.

4. Interview with Sharon Osberg.

5. Buffett, speaking to the Oquirrh Club, "An Evening with Warren Buffett," October 2003.

Chapter 5

1. Warren's sister Doris Buffett, the family genealogist, has done extensive research on the Buffett family tree. This abbreviated account of the early ancestors is drawn from her research.

2. Either Nathaniel or Joseph.

3. This was the largest and finest of the livery stables in town, with seventy horses at its peak, boasting sleighs, buggies, a circus bateau, and even a hearse. It prospered for a number of years but disappeared sometime around the early days of the automobile. "Six Generations Prove That Buffett Family Is Really Here to Remain," *Omaha World-Herald,* June 16, 1950.

4. Orville D. Menard, "Tom Dennison…The Rogue Who Ruled Omaha," *Omaha,* March 1978. John Kyle Davis, "The Gray Wolf: Tom Dennison of Omaha," *Nebraska History,* Vol. 58, No. 1, Spring 1977.

5. "Dry Law Introduced as Legislators Sing," *Omaha World-Herald,* February 1, 1917.

6. "Omaha's Most Historic Grocery Store Still at 50th and Underwood," *Dundee and West Omaha Sun,* April 25, 1963.

7. Zebulon Buffett, letter to Sidney Buffett, December 21, 1869.

8. Sidney's store was originally named Sidney H. Buffett and Sons, where both brothers, Ernest and Frank, worked. The store originally sat at 315 South 14th Street downtown, where it stayed until its closing in 1935. Frank took over as sole proprietor after Sidney's death in 1927. In 1915, Ernest opened a branch store, which moved west to 5015 Underwood Avenue in Dundee in 1918. (At the time Dundee was a separate town, eventually annexed by Omaha.)

9. A third child, named Grace, died in 1926. Three more, George, Nellie, and Nettie, died at young ages in the nineteenth century.

10. Warren Buffett quoting Charlie Munger.

11. According to Doris Buffett, she was born Daisy Henrietta Duvall and began to call herself Henrietta (after her mother) rather than Daisy by the time she arrived in Omaha.

12. Charles T. Munger letter to Katharine Graham, November 13, 1974.

13. Ernest Buffett letter to Barnhart & Son, February 12, 1924.

14. Interview with Charlie Munger. His mother told him this story, although, he notes, "she may have been garnishing it just a bit." But others recall the notebook.

15. In letters like one to his son Clarence in January 1931, he analyzed the effect of railroad automation on unemployment and suggested that the best solution for the Great Depression was a great public-works project. It seems ironic that he and his son Howard became such foes of Roosevelt when he initiated the Works Progress Administration after the next election.

16. Ernest Buffett letter to Fred and Katherine Buffett, undated, "ten years after you were married," circa June 1939.

17. He died young, in 1937, in an auto accident in Texas.

18. Coffee with Congress, radio interview with Howard, Leila, Doris, and Roberta Buffett, WRC Radio, October 18, 1947, Bill Herson, moderator. (Note: This description is based on a tape of the broadcast.)

19. Interview with Doris Buffett.

20. Based primarily on family files.

21. Bryan's "Cross of Gold" speech, delivered on July 9, 1896, has been called the most famous political speech in American history. Bryan is best remembered for opposing the gold standard and for getting involved in the Scopes case, where the famous lawyer Clarence Darrow made him look foolish for testifying against teaching evolution in schools. In fact his interests were broader and less extreme and his contemporary influence greater than he is generally remembered for today.

22. Family files. Bernice blamed her father for marrying into a family with genetic mental defects, begetting children who would suffer the result.

23. Leila was a freshman at Nebraska during the 1923–24 academic year, according to the Cornhusker yearbook, when Howard was a junior. On Coffee with Congress, Howard noted that they met in the fall of 1923, when Leila was 19. Because students usually entered college at 17, this suggests she worked for about two years before starting. She pledged Alpha Chi Omega as a freshman in the 1923–24 school year, but was still classified as a freshman in 1925, suggesting she went home to work on the newspaper and returned in the spring of 1925.

24. Probably in fall 1923.

25. Howard was secretary of the Innocents (*Daily Nebraskan,* September 27, 1923). This group persisted for many more years, until, as Buffett puts it, "the day came when they couldn't find thirteen who were innocent."

26. Coffee with Congress.

27. Interview with Roberta Buffett Bialek.

28. At Harry A. Koch Co., whose motto was "Pays the Claim First." He made $125 a month.

29. Receipt from Beebe & Runyan, December 21, 1926, annotated by Leila.

30. They were married December 26, 1925.

31. February 12, 1928.

32. Howard became a deacon in 1928 at the age of 25.

33. Address to the American Society of Newspaper Editors, Washington, D.C., January 25, 1925.

Chapter 6

1. Even so, only three in a hundred Americans owned stocks. Many had borrowed heavily to play the market, entranced by John J. Raskob's article, "Everybody Ought to Be Rich" in the August 1929 *Ladies' Home Journal* and Edgar Lawrence Smith's proof that stocks outperform bonds (*Common Stocks as Long-Term Investments.* New York: The MacMillan Company, 1925).

2. "Stock Prices Slump $14,000,000,000 in Nation-Wide Stampede to Unload; Bankers to Support Market Today," *New York Times,* October 29, 1929; David M. Kennedy, *Freedom from Fear, The American People in Depression and War, 1929–1945.* New York: Oxford University Press, 1999; John Brooks, *Once in Golconda, A True Drama of Wall Street; 1920–1938.* New York: Harper & Row, 1969. Roger Babson's famous warning, "I repeat what I said at this time last year and the year before, that sooner or later a crash is coming," was useless.

3. Kennedy, *Freedom from Fear.* Kennedy notes that interest payment on the national debt rose from $25 million annually in 1914 to $1 billion annually in the 1920s due to World War I, accounting for one-third of the federal budget. The actual budget in 1929 was $3.127 billion a year (*Budget of the U.S. Government, Fiscal Year 1999—Historical Tables,* Table 1.1—Summary of Receipts, Outlays, and Surpluses or Deficits: 1789–2003. Washington, D.C.: Government Printing Office).

4. By the bottom tick on November 13, the market had lost $26 to $30 billion of its roughly $80 billion precrash value (Kennedy, op. cit., Brooks, op. cit.). World War I cost approximately $32 billion (Robert McElvaine, *The Great Depression: America, 1929–1941.* New York: Three Rivers Press, 1993; also Hugh Rockoff, *It's Over, Over There: The U.S. Economy in World War I,* National Bureau of Economic Research Working Paper No. 10580).

5. Charlie Munger reported that all the Buffetts, including those employed elsewhere, worked at the store, in a letter to Katharine Graham dated November 13, 1974.

6. Coffee with Congress.

7. Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

8. Roger Lowenstein, in *Buffett,* cites Leila Buffett's memoirs for this fact.

9. Ernest Buffett letter to Mr. and Mrs. Clarence Buffett and Marjorie Bailey, August 17, 1931.

10. "Union State Bank Closes Doors Today: Reports Assets in Good Condition; Reopening Planned," *Omaha World-Herald,* August 15, 1931. Characteristically, the story understated the bank's dire situation. It went into reorganization under regulatory supervision and filed for bankruptcy.

11. Howard had borrowed $9,000 to buy $10,000 of stock in the bank. The stock was now worthless. The house and mortgage were in Leila's name. Standard Accident Insurance Company, Howard Homan Buffett application for fidelity bond.

12. "Buffett, Sklenicka and Falk Form New Firm," *Omaha Bee News,* September 8, 1931. Statement of Buffett, Sklenicka & Co. for the month ending September 30, 1931.

13. The wave crested in December 1931 with the failure of the Bank of the United States, an official-sounding institution that had nothing to do with the government. The $286 million collapse broke a record, took down 400,000 depositors, and was understood by everyone—in one sense or another—as a failure of public trust (Kennedy, *Freedom from Fear*). It kicked the quivering legs out from under the banking system and sent the already battered economy into collapse.

14. Although its return on revenues was low, the firm by then was consistently profitable and would remain so, with the exception of a couple of months.

15. By the end of 1932, Howard Buffett was averaging 40–50% more in commissions than in 1931, based on financial statements of Buffett, Sklenicka & Co.

16. Charles Lindbergh Jr., "The Little Eaglet," was kidnapped on March 1, 1932. His body was found on May 12, 1932. Many parents in the 1920s and 1930s were preoccupied with kidnapping, a fear that actually began with the Leopold and Loeb case in 1924 but peaked with the Lindbergh baby. An Omaha country-club groundskeeper claimed he was kidnapped and robbed of $7. In Dallas a minister faked his own kidnapping, trussing himself to his church's electric fan (*Omaha World-Herald,* August 4, 1931, and June 20, 1931).

17. According to Roberta Buffett Bialek, Howard once had rheumatic fever, which may have weakened his heart.

18. Interview with Doris Buffett.

19. Interview with Doris Buffett. Warren also remembers this.

20. Interview with Roberta Buffett Bialek.

21. Interviews with Jack Frost, Norma Thurston-Perna, Stu Erikson, Lou Battistone.

22. The correct clinical term for Leila's condition is unknown, but it may have boiled down to a literal pain in the neck: occipital neuralgia, a chronic pain disorder caused by irritation or injury to the occipital nerve, which is located in the back of the scalp. This disorder causes throbbing, migrainelike pain, which originates at the nape of the neck and spreads up and around the forehead and scalp. Occipital neuralgia can result from physical stress, trauma, or repeated contraction of the neck muscles.

23. Interview with Katie Buffett. This may have been while pregnant with either Warren or Bertie.

24. Interview with Katie Buffett.

25. "Beer Is Back! Omaha to Have Belated Party," *Omaha World-Herald,* August 9, 1933; "Nebraska Would Have Voted Down Ten Commandments, Dry Head Says," *Omaha World-Herald,* November 15, 1944; "Roosevelt Issues Plea for Repeal of Prohibition," Associated Press, July 8, 1933, as printed in *Omaha World-Herald*.

26. U.S. and Nebraska Division of Agricultural Statistics, *Nebraska Agricultural Statistics, Historical Record 1866–1954.* Lincoln: Government Printing Office, 1957; *Almanac for Nebraskans 1939,* The Federal Writers' Project Works Progress Administration, State of Nebraska; Clinton Warne, "Some Effects of the Introduction of the Automobile on Highways and Land Values in Nebraska," *Nebraska History* quarterly, The Nebraska State Historical Society, Vol. 38, Number 1, March 1957, page 4.

27. In Kansas, a banker sent to foreclose on a farm turned up dead, shot full of .22-and .38-caliber bullets and dragged by his own car. "Forecloser on Farm Found Fatally Shot," *Omaha World-Herald,* January 31, 1933. See also "'Nickel Bidders' Halted by Use of Injunctions," *Omaha World-Herald,* January 27, 1933; "Tax Sales Blocked by 300 Farmers in Council Bluffs," *Omaha World-Herald,* February 27, 1933; "Penny Sale Turned into Real Auction," *Omaha World-Herald,* March 12, 1933; "Neighbors Bid $8.05 at Sale When Man with Son, Ill, Asks Note Money," *Omaha World-Herald,* January 28, 1933, for examples of the mortgage crisis.

28. "The Dust Storm of November 12 and 13, 1933," *Bulletin of the American Meteorological Society,* February 1934; "60 Miles an Hour in Iowa," special to the *New York Times,* November 13, 1933; Waudemar Kaempffert, "The Week in Science: Storms of Dust," *New York Times,* November 19,1933.

29. Also cited from Leila's memoirs in Roger Lowenstein's *Buffett.*

30. From the *Almanac for Nebraskans 1939*. Sponsored by the Nebraska State Historical Society, which also

contained some tall tales such as the idea of scouring pots by holding them up to a keyhole.

31. "Hot Weather and the Drought of 1934," *Bulletin of the American Meteorological Society,* June–July 1934.

32. Grasshoppers are the informal state mascot; Nebraska terms itself the "Bugeater State." Long before the Cornhuskers name, the University of Nebraska football team called itself the "Bugeaters" in 1892 in honor of its flying guests. Nebraska football fans still informally call themselves Bugeaters. Grasshoppers love drought conditions and contribute to soil erosion by devouring every living plant down to the black earth. From 1934–1938 the estimated national cost of grasshopper destruction was $315.8 million (about $4.7 billion in 2007 dollars). The region encompassing Nebraska, the Dakotas, Kansas, and Iowa was the epicenter of grasshopper infestation. See *Almanac for Nebraskans 1939*; also Ivan Ray Tannehill, *Drought: Its Causes and Effects.* Princeton: University Press, 1947.

33. "Farmers Harvest Hoppers for Fish Bait," *Omaha World-Herald,* August 1, 1931.

34. As asserted in Franklin Delano Roosevelt's inaugural address (March 4, 1933)—he was speaking, however, of economic paralysis.

35. Lacking electronic security and thoughtful cash controls, banks were more vulnerable to robbery in those days, and an epidemic of bank robberies took place in the 1930s.

36. Several Buffetts, including Howard and Bertie, contracted polio. Another epidemic took place in the mid-1940s. People born after the vaccine became available in the 1950s and '60s may find the chronic anxiety this disease engendered difficult to comprehend, but it was very real at the time.

37. In 1912, twenty-five people were injured when a howling wind derailed a train near North Loup, Nebraska, according to the *Almanac for Nebraskans 1939*.

38. Ted Keitch letter to Warren Buffett, May 29, 2003. Keitch's father worked at the Buffett store.

39. Interview with Doris Buffett.

40. Howard wanted his children to attend Dundee's Benson High School instead of Central, where he had suffered from snobbery.

41. Marion Barber Stahl was a partner in his own firm, Stahl and Updike, and had become counsel to the *New York Daily News,* among other clients. He and his wife, Dorothy, lived on Park Avenue and had no children. Obituary of Marion Stahl, *New York Times,* November 11, 1936.

42. Interview with Roberta Buffett Bialek.

43. Interviews with Roberta Buffett Bialek, Warren Buffett, Doris Buffett.

44. Interview with Doris Buffett.

45. September 9, 1935, at the Columbian School.

46. Interview with Roberta Buffett Bialek as well as Warren Buffett.

Chapter 7

1. Adults interviewed by the author who attended Rosehill as children recall it as idyllic, yet the year before Warren started first grade, Rosehill parents pleaded for relief from overcrowded rooms and a "mud hole" playground. They were told not to expect help "until the sheriff collects back taxes." "School Plea Proves Vain," *Omaha World-Herald,* January 22, 1935.

2. Interview with Roberta Buffett Bialek.

3. Walt Loomis, the teacher of the boxing lesson, was a big kid, about Doris's age.

4. Interview with Roberta Buffett Bialek.

5. Stella's doctors referred to her as schizophrenic, while noting she suffered annually from predictable periods of agitation and confusion, and indicated that her personality did not deteriorate as expected in schizophrenia. Based on family history and Bernice's statement that other older relatives in addition to Stella's mother, Susan Barber, were "maniacal" and mentally unstable, bipolar disorder may be suspected as the real condition. This disease was barely understood, to say the least, in the 1930s and '40s.

6. From an entry in Leila's "day book."

7. In an interview, one of his classmates, Joan Fugate Martin, recalled Warren showing up on his rounds periodically to "shoot the breeze" in her driveway.

8. Interview with Roberta Buffett Bialek.

9. Interviews with Stu Erickson, Warren Buffett.

10. According to his Rosehill transcript, Warren was promoted to 4B in 1939.

11. Interview with Stu Erickson.

12. *"My appendectomy was the high point of my social life,"* Buffett says.

13. *"I wish one of those nuns had gone bad,"* he says today.

14. Rosco McGowen, "Dodgers Battle Cubs to 19-Inning Tie," *New York Times,* May 18, 1939. (Warren and Ernest did not stay for the entire game.)

15. Ely Culbertson, *Contract Bridge Complete: The New Gold Book of Bidding and Play.* Philadelphia: The John C. Winston Co., 1936.

16. This explanation of bridge was provided by Bob Hamman, eleven-time world champion and #1-ranked bridge player in the world between 1985 and 2004. Hamman appears at the Berkshire shareholders' meeting.

Chapter 8

1. Warren bought the gum for three cents a pack from his grandfather.

2. Interviews with Doris Buffett, Roberta Buffett Bialek.

3. Two presidents, Ulysses S. Grant and Theodore Roosevelt, had previously sought election to a third term. Both were defeated.

4. The Trans-Lux Corporation placed the first ticker-tape projection system at the New York Stock Exchange in 1923. The system worked something like a fax machine. Trans-Lux knew a good thing when it saw one: The company's own stock was listed on the American Stock Exchange in 1925, and Trans-Lux remains the oldest listed company on the Amex today.

5. Frank Buffett had reconciled with Ernest on Henrietta's death in 1921 and ran the other Buffett store. John Barber was a real estate agent.

6. Pyramid schemes are frauds that promise investors impossible returns, using cash from later investors to pay off earlier investors and create the appearance of success. To keep going, the scheme has to grow like a pyramid, but their geometrically compounding structure guarantees eventual failure and discovery.

7. Alden Whitman, "Sidney J. Weinberg Dies at 77; 'Mr. Wall Street' of Finance," *New York Times,* July 24, 1969; Lisa Endlich, *Goldman Sachs: The Culture of Success.* New York: Knopf, 1999.

8. That Weinberg cared about his opinion mattered more than the opinion itself; Buffett has no recollection of which stock he recommended to Weinberg.

9. Buffett later said, in an interview, that these were the words that ran through his head—"that's where the money is"—although at the time he was not familiar with the famous quote attributed to bank robber Willie Sutton.

10. Almost a decade later, he would lower the age to 30 while talking to his sister Bertie, who was 14 or 15 at the time. Interview with Roberta Buffett Bialek.

11. Buffett believes he overheard his father talking about the stock, which traded on the "Curb Exchange," where brokers gathered in the street (later organized into the American Stock Exchange).

12. From the records of Buffett, Sklenicka & Co.

Chapter 9

1. "All these handouts in Europe are being used by the politicians to retain and expand their own power." "U.S. Moving to Socialism," citing Howard Buffett, *Omaha World-Herald,* September 30, 1948.

2. Roosevelt said this in Boston on October 30, 1940, while campaigning for his third term, fourteen months before Pearl Harbor.

3. Leila Buffett letter to Clyde and Edna Buffett, undated but approximately 1964.

4. United States Department of Agriculture and Nebraska Department of Agriculture, *Nebraska Agricultural Statistics (preliminary report) 1930.* Lincoln, Government Printing Office, 1930, p. 3.

5. Buffett's impression of 1940s South Omaha was vivid: *"If you walked around down there in those days, believe me, it was not conducive to eating hot dogs."*

6. John R. Commons, "Labor Conditions in Meat Packing and Recent Strike," *The Quarterly Journal of Economics,* November 1904; Roger Horowitz, "'Where Men Will Not Work': Gender, Power, Space and the Sexual Division of Labor in America's Meatpacking Industry, 1890–1990," *Technology and Culture,* 1997; Lawrence H. Larsen and Barbara J. Cottrell, *The Gate City: A History of Omaha.* Lincoln: The University of Nebraska Press, 1997; Harry B. Otis, with Donald H. Erickson, *E. Pluribus Omaha: Immigrants All.* Omaha: Lamplighter Press (Douglas County Historical Society), 2000. Horowitz, commenting specifically on Omaha, points out that slaughterhouses in 1930 were still organized much the same way as portrayed in Upton Sinclair's 1906 novel *The Jungle.*

7. In 2005, the GAO cited "respiratory irritation or even asphyxiation from exposure to chemicals, pathogens, and gases" as a current occupational risk for industry workers in GAO 05-95 *Health and Safety of Meat and Poultry Workers.* See also Nebraska Meatpacking Industry Workers Bill of Rights (2000), a "voluntary instrument" whose "reach has been modest," according to Joe Santos of the state labor department, as cited by Human Rights Watch in its report *Blood, Sweat and Fear: Workers' Rights in the U.S. Meat and Poultry Industry,* December 2004.

8. This description of Washington in wartime owes much to David Brinkley's *Washington Goes to War* (New York: Alfred A. Knopf, 1988).

9. With so many men off to war, 15% of the city's buses and trolleys sat idle. The Capital Transit company refused to hire blacks as conductors and motormen after it hired one black conductor in 1943 and the white conductors walked off the job. (Over the course of 1944 and 1945, J. Edgar Hoover, Director of the FBI, reported to the Attorney General that "If the company employs Negroes as operators there will be an immediate 'wildcat' strike…and the inevitable result would be the complete paralysis of the transportation system in the District of Columbia." (Office memorandums re: racial conditions in Washington, D.C., September 5, 1944, and December 9, 1944, from Georgia State Special Collections.)

10. Howard University students used "stool-sitting" on two occasions: In April 1943, at Little Palace cafeteria, until the proprietor changed his policy, and a year later, with fifty-six students at Thompson's Restaurant, where some whites joined the cause, a crowd gathered, and the police got Thompson's to serve everyone, temporarily. (Flora Bryant Brown, "NAACP Sponsored Sit-Ins by Howard University Students in Washington, D.C., 1943–1944," *The Journal of Negro History, 85.4,* Fall 2000).

11. Dr. Frank Reichel headed American Viscose.

12. Interviews with Doris Buffett, Roberta Buffett Bialek, Warren Buffett.

13. Buffett is probably embellishing a little here with hindsight.

14. Interview with Roberta Buffett Bialek.

15. Gladys, formerly known as Gussie, changed her name to Mary sometime during this period. Warren vainly pursued a romance with her daughter Carolyn, who later married Buffett's friend Walter Scott.

16. Warren claims it was Byron's idea. Byron claims it was Warren's idea. Stu says he can't remember.

17. Joan Fugate Martin, who remembers the date, in an interview corroborated the story. She called the boys perfect gentlemen, but had nothing to add about their self-confessed awkwardness.

18. Interviews with Stu Erickson and Byron Swanson, who supplied various details of the story.

19. The phone number is from a letter from Mrs. Anna Mae Junno, whose grandfather used to work as a meat cutter.

20. The lowly stock boy was Charlie Munger.

21. Interview with Katie Buffett.

22. Ibid. Leila had a striver's fascination with social hierarchies and upward mobility.

23. *"You might argue that it was working in my grandfather's grocery store that fostered a lot of desire for independence in me,"* Buffett says.

24. This letter, which was at one time one of Buffett's treasured heirlooms, resided in his desk drawer for many years, written on a piece of yellow paper. He can no longer locate it. Through a trade association, Ernest lobbied against chain stores and worked for legislation that would levy special taxes on them—in vain.

25. Interview with Doris Buffett.

26. Warren Buffett letter to Meg Greenfield, June 19, 1984.

27. Sadly, no one in the family can locate a copy of this manuscript today.

28. Spring Valley marketing brochure. The place had its own coat of arms.

29. "Women Accepted for Volunteer Emergency Service." Before the WAVES, the Navy accepted women only as nurses.

30. Alice Deal Junior High School was named after the first junior high principal in Washington, D.C.

31. Buffett is reasonably sure Ms. Allwine was his English teacher and that *"she had good reason"* for her low opinion of him. *"I deserved it,"* he says.

32. Interview with Casper Heindel.

33. *"I'm not sure I paid tax on that either,"* Warren adds.

34. In her memoir, Leila wrote that Warren would not let her touch the money.

35. Roger Bell, who confirms the story in an interview, was saving war-bond stamps until he had enough to buy an actual bond, and cashed them in to fund the trip. "I told my mother we were going, but she didn't believe me," he says.

36. Interview with Roger Bell.

37. From Buffett's 1944 report cards.

38. Based on comments in his report cards.

39. Interview with Norma Thurston-Perna.

40. Queen Wilhelmina owned stock in the Dutch holding company that had bought The Westchester.

41. He collected the bus passes from various routes. *"They were colorful. I collected anything."* Asked if anyone else in his family ever collected anything: *"No. They were more popular."*

42. Customers also discarded old magazines in the stairwells, and Warren would pick them up.

43. While Warren recalls the story, it was Lou Battistone who remembered its fascinating details.

44. Interview with Lou Battistone.

Chapter 10

1. This particular prank letter circulated widely in the mid-twentieth century. Where the idea originated and from whom Warren might have gotten a copy is unknown. What makes this fondly recalled prank funny (putting aside whether or how often he actually perpetrated it and upon whom) is how it plays to the commonplace interest in hidden lives and feet of clay. Its essence is a tribute to the power of shame.

2. The impact of Sears, the first department store in Tenleytown, and its unusual rooftop parking lot are described in Judith Beck Helm's *Tenleytown, D.C.: Country Village into City Neighborhood.* Washington, D.C.: Tennally Press, 1981.

3. In an interview, Norma Thurston-Perna substantiates the essential elements of this story, recalls her boyfriend Don Danly "hooking" from Sears with Warren, adds that to some extent this behavior continued into high school, and mentions how annoyed she was to discover that an impressive honeysuckle fragrance and bath powder set given to her by Don as a birthday gift turned out to have been stolen from Sears.

4. A letter from Suzanne M. Armstrong to Warren Buffett, December 20, 2007, recalls a friend of her father's cousin, Jimmy Parsons, stealing golf balls with Buffett while at Woodrow Wilson High School.

5. Hannibal was the antihero of the book and movie *The Silence of the Lambs.*

Chapter 11

1. See John F. Kennedy, *Profiles in Courage* (New York: HarperCollins, 1955) for an admiring portrait of Taft written from the perspective of the other side of the aisle.

2. From 1933, when the U.S. went off the gold standard, through 1947, the Consumer Price Index fluctuated wildly, spiking over 18%. The history of the Federal Reserve under inflationary conditions was short and provided little evidence to support an opinion either way.

3. Interview with Roberta Buffett Bialek. The others remember this story.

4. Coffee with Congress.

5. Interview with Katie Buffett. Leila apparently became obsessed with Wallis Warfield Simpson around 1936 during the abdication crisis in England.

6. Woodrow Wilson's terms ran through February and June. Because Warren had skipped half a grade, he started his sophomore year in February.

7. Cartoonist Al Capp created Li'l Abner, who inherited his strength from his mother, the domineering Mammy Yokum, whose knockout "Good night Irene" punch maintained discipline among the Yokum clan.

8. Interview with Doris Buffett.

9. Battistone recalls Howard giving them a lift at least part of the way.

10. Although most of this information is from *Strength and Health,* Elizabeth McCracken wrote "The Belle of the Barbell," a tribute to Pudgy Stockton, in the *New York Times Magazine,* December 31, 2006.

11. Pudgy was married to Les Stockton, a bodybuilder who had introduced her to weight lifting.

Chapter 12

1. *"It was never any big success at all…it did not do well. It did not do terribly either. And it didn't last very long,"* says Buffett.

2. In interviews, Roger Bell and Casper Heindel, as well as Warren Buffett, helped remember details about the farm. Buffett believes he bought this from or through his uncle John Barber, a real estate broker.

3. Interview with Casper Heindel. More than half of all Nebraska land was farmed by tenant farmers. Real property ownership with mortgages was unpopular because unstable crop prices left farmers vulnerable to foreclosure.

4. Interview with Norma Thurston-Perna.

5. In an interview, Lou Battistone observes that he noticed the "two sides" of Buffett's brain in high school—the cool mathematical businessman and the burlesque-watching one—while at the burlesque.

6. Interview with Lou Battistone.

7. Buffett told this story at Harvard Business School in 2005.

8. Carnegie was a salesman for Armour & Co., covering the Omaha territory; the compatibility of his views

with Buffett's temperament probably owes something to a shared Midwestern ethos.

9. All text, Dale Carnegie, *How to Win Friends and Influence People*. New York: Simon & Schuster, 1938. Copyright Dale Carnegie & Associates. Courtesy of Dale Carnegie & Associates.

10. Dale Carnegie quoting John Dewey.

11. The average man earned $2,473 a year in 1946, according to the U.S. Department of Commerce, Bureau of the Census, *Historical Statistics of the United States: Colonial Times to 1970, Bicentennial Edition.* Washington, D.C.: Government Printing Office, 1975, Series D-722–727, p. 164.

12. According to Lou Battistone in an interview.

13. According to a newspaper advertisement on July 24, 1931, at early Depression-era prices a dozen years earlier, quality refurbished golf balls cost three for $1.05.

14. Interview with Don Dedrick, a golf teammate from high school.

15. Interview with Lou Battistone.

16. *"We were the only guys that paid the fifty-dollar stamp tax on pinball machines,"* Warren says. *"I'm not sure we would have done it if my dad hadn't been insisting."*

17. Interview with Lou Battistone. The name "Wilson" came from Woodrow Wilson High School.

18. An essay into barbershop food concession ended quickly after the peanut dispenser, filled with five pounds of Spanish nuts, broke and got customers a handful of peanuts mixed with ground glass.

19. Dialogue and expressions used by Buffett in this story came from Lou Battistone, although the facts align with Buffett's recollection.

20. Interview with Don Dedrick.

21. In one version of this story, told by a high school friend of Buffett's who was not present, Kerlin was too smart to fall for it and never made it to the golf course. Whatever happened, Buffett's version is, not surprisingly, funnier.

Chapter 13

1. Interview with Katie Buffett.

2. While this story sounds buffed and polished over the years, the tone of it rings true. Letters from Warren at college to his father a couple of years later have the same breeziness.

3. Interview with Stu Erickson.

4. Interview with Don Dedrick.

5. Interview with Bob Dwyer.

6. According to Gray, Buffett also jokingly dreamed up an idea for a magazine called *Sex Crimes Illustrated* while they were on the train to the Havre de Grace racetrack.

7. Interview with Bill Gray, now Emeritus Professor of Atmospheric Science at Colorado State University and head of the Tropical Meteorology Project.

Chapter 14

1. The class size is approximate because Woodrow Wilson had, in effect, two classes graduating in parallel (February and June graduates); students like Warren could shift from February to the previous June by taking a few extra credits. The school described Buffett's top 50 ranking as falling in the top "one-seventh" of his class.

2. Barbara "Bobby" Weigand, who remembers only the hearse. Doris Buffett recalled the family debate about the hearse.

3. Interviews with Bob Feitler, Ann Beck MacFarlane, Waldo Beck. David Brown became brother-in-law of Waldo Beck, Ann Beck's brother.

4. Interviews with Bob Feitler, Warren Buffett. Note that, because he was using the car for commercial purposes, Buffett would probably have been able to get extra gas coupons at a time when gas was tightly rationed.

5. The term "policy" probably came from the Gaelic *pá lae sámh* (pronounced *paah lay seeh*), which means "easy payday," a nineteenth-century Irish-American gambling term.

6. The bill generated fierce anti-Taft labor reprisals in the Midwest.

7. Interview with Doris Buffett.

8. Estimate based on data supplied by Nancy R. Miller, Public Services Archivist, The University Archives and Record Center, University of Pennsylvania.

9. Jolson, a vaudeville singer, was the most popular stage entertainer of the early twentieth century. He made famous such songs as "You Made Me Love You," "Rock-a-Bye Your Baby with a Dixie Melody," "Swanee," "April Showers," "Toot, Toot, Tootsie, Goodbye," and "California, Here I Come." He performed "My Mammy" in blackface in the 1927 movie *The Jazz Singer,* the first feature film to enjoy widespread commercial success. Jolson was voted "Most Popular Male Vocalist" in a 1948 *Variety* poll on the back of a film about his life, *The Al Jolson Story,* which repopularized him to a younger generation. Performing in blackface would be considered racist today but was ubiquitous and unremarkable at the time.

10. "My Mammy," words by Sam Lewis and Joe Young; music by Walter Donaldson, copyright 1920.

11. Rich Cohen, "Pledge Allegiance." From *Killed: Great Journalism Too Hot to Print,* ed. David Wallace. New York: Nation Books, 2004.

12. Interview with Clyde Reighard.

13. Coffee with Congress.

14. Interview with Chuck Peterson.

15. Interview with Clyde Reighard.

16. Interviews with Chuck Peterson, Sharon and Gertrude Martin.

17. Interview with Anthony Vecchione, as quoted in Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

18. Peterson recalls that he stuck it out all year—or, well, almost.

19. Interview with Doris Buffett.

20. Kenesaw Mountain Landis, *Segregation in Washington: A Report, November 1948.* Chicago: National Committee on Segregation in the Nation's Capital, 1948.

21. Interview with Bob Dwyer.

22. Don Danly, as quoted in Lowenstein, *Buffett*. Danly is deceased.

23. Interview with Norma Thurston-Perna.

24. Interview with Barbara Worley Potter.

25. Interview with Clyde Reighard.

26. Beja, as quoted in Lowenstein, *Buffett.* Beja is deceased.

27. Interview with Don Sparks.

28. Shoe-shining was a big thing at Penn; a typical pledge haze was to shine the actives' shoes.

29. In an interview, Reighard recalled the outlines of the story. Buffett became a close friend of the victim Beja's roommate, Jerry Oransky (renamed Orans), who is deceased.

30. Interview with Barbara Worley Potter.

31. Interview with Ann Beck MacFarlane, who thinks the date was engineered by her parents and Leila Buffett.

32. Susan Thompson Buffett described her husband circa 1950 this way.

33. Interview with Clyde Reighard.

34. Interview with Bob Feitler.

35. Interview with Clyde Reighard.

36. Interview with Anthony Vecchione, as quoted in Lowenstein, *Buffett.*

37. Interview with Martin Wiegand.

38. "Buffett Lashes Marshall Plan," *Omaha World-Herald,* January 28, 1948. Buffett campaign literature also describes foreign aid as money down the rat hole.

39. June 5, 1948, dedication of Memorial Park.

40. Last will and testament of Frank D. Buffett, filed February 19, 1949.

41. Approved application to the county court of Douglas County, Nebraska, April 14, 1958. The bonds were allowed to mature, since the will said proceeds of any property "sold" could only be invested in U.S. bonds. Given the opportunity cost and interest rates, Howard's move was wise.

42. Leila Buffett's day books. "It's Cold—But Remember that Bitter Winter of '48–'49?" *Omaha World-Herald,* January 6, 1959.

43. *Commercial & Financial Chronicle,* May 6, 1948.

44. Interview with Doris Buffett.

45. Interview with Lou Battistone.

46. Interview with Sharon Martin.

47. Interviews with Waldo Beck and Ann Beck MacFarlane, to whom Brown repeated the story.

Chapter 15

1. They would sell 220 dozen balls for a total of $1,200.

2. Warren Buffett letter to Howard Buffett, February 16, 1950.

3. He asked Howard to advance him $1,426 that the broker required him to keep on deposit, signing off, "Yours, for lower auto profits, Warren." Warren Buffett letter to Howard Buffett, February 16, 1950.

4. Warren Buffett letter to Jerry Orans, May 1, 1950, cited in Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

5. "Bizad Students Win Scholarships," *Daily Nebraskan,* May 19, 1950.

6. Benjamin Graham, *The Intelligent Investor: A Book of Practical Counsel.* New York: Harper & Brothers, 1949.

7. Garfield A. Drew, *New Methods for Profit in the Stock Market.* Boston: The Metcalf Press, 1941.

8. Robert D. Edwards and John McGee, *Technical Analysis of Stock Market Trends.* Springfield, Mass.: Stock Trend Service, 1948.

9. Wood, as cited in Lowenstein, *Buffett.* Wood is deceased. He told Lowenstein he was not sure when this conversation took place—before Buffett was rejected by Harvard or as late as after when he had started at Columbia, but it was apparently before he met Graham himself.

10. According to Buffett, Howard Buffett was acquainted with one of the board members.

11. Columbia University in the City of New York, announcement of the Graduate School of Business for the winter and spring sessions 1950–1951, Columbia University Press.

Chapter 16

1. In his memoir, *Man of the House* (New York: Random House, 1987), the late Congressman Tip O'Neill recalled that his pastor, Monsignor Blunt, said it was a sin for Catholics to go to the Protestant-managed YMCA. O'Neill and a Jewish friend stayed at the Sloane House anyway. The regular rate in the 1930s was sixty-five cents a night, but, O'Neill said, "If you signed up for the Episcopal service, it was only thirty-five cents, with breakfast included. We were nobody's fool, so we signed up for the thirty-five-cent deal and figured to duck out after breakfast and before the service. But apparently we weren't the first to think of this brilliant plan, because they locked the doors during breakfast, which meant that we were stuck." By the 1950s, there was no longer a "pray or pay" deal at the Sloane House. "If there had been," Buffett says, "I would have experienced a revelation and embraced whatever denomination offered the greatest discount."

2. Buffett is not certain if the smoking deal applied to all three of the Buffett kids or only his sisters, but they all got the $2,000 on graduation on roughly the same terms.

3. Most of the money was invested in U.S International Securities and Parkersburg Rig & Reel, which he replaced with Tri-Continental Corporation on January 1, 1951. Howard contributed most of the money and

Warren contributed the ideas and work, or "sweat equity," to an informal partnership.

4. Benjamin Graham and David L. Dodd, *Security Analysis, Principles and Technique.* New York: McGraw-Hill, 1934.

5. Barbara Dodd Anderson letter to Warren Buffett, April 19, 1989.

6. David Dodd letter to Warren Buffett, April 2, 1986.

7. The Union Pacific Railroad in the nineteenth century was the most scandal-plagued and bankruptcy-riddled of the nation's railroads.

8. William W. Townsend, *Bond Salesmanship.* New York: Henry Holt, 1924. Buffett read this book three or four times.

9. Interview with Jack Alexander.

10. And, according to Buffett, one woman, Maggie Shanks.

11. Interview with Fred Stanback.

12. Anyone of a certain age from the Mid-Atlantic region would still recognize the slogan, "Snap back with Stanback," and "neuralgia" as an old-fashioned term for a bad headache.

13. The SEC's Regulation FD now bars selective disclosure of material nonpublic information and requires that it be disseminated simultaneously by companies to the market on a timely basis.

14. At $2,600 a year, Schloss as an investor was making less than the average secretary in 1951, who took home $3,060, according to a survey of the National Secretaries Association.

15. Interview with Fred Stanback.

16. Interview with Walter Schloss. Some material is from *The Memoirs of Walter J. Schloss*. New York: September Press, 2003.

17. Benjamin Graham, *The Memoirs of the Dean of Wall Street.* New York: McGraw-Hill, 1996.

18. Stryker & Brown was the "market maker," or principal dealer, in Marshall-Wells stock.

19. Marshall-Wells was the second Graham and Dodd stock he had bought, after Parkersburg Rig & Reel. Stanback confirms the lunch with Green, but can't recall the date.

20. Not, as has been written, from *Who's Who in America.* However, he may have learned it from reading *Moody's,* hearing it from David Dodd or Walter Schloss, or from a newspaper or magazine source.

21. Due to a legal technicality, this divestiture of GEICO stock was required in a consent order with the SEC in 1948. Graham-Newman violated Section 12(d)(2) of the Investment Company Act of 1940, although "in the bona fide, though mistaken, belief that the acquisition might lawfully be consummated." A registered investment company (Graham-Newman was "a diversified management investment company of the open-end type") cannot acquire more than 10% of the total outstanding voting stock of an insurance company if it does not already have 25% ownership.

22. GEICO oral history interview of Lorimer Davidson by Walter Smith, June 19, 1998, and also see William K. Klingaman, *GEICO, The First Forty Years.* Washington, D.C.: GEICO Corporation, 1994, for a condensed version of this story.

23. Making $100,000 in 1929 was equivalent to making $1,212,530 in 2007.

24. By 1951, GEICO was deemphasizing mailings in favor of platoons of friendly telephone operators who answered the phone at regional offices and were trained to quickly screen bad risks.

25. A type of auto insurer called "nonstandard" specializes in these customers, surcharging them, say, 80%. USAA and GEICO at the time were "ultra-preferred" companies, specializing in the best risks.

26. The main problem with tontines was that people were gambling with their life insurance policies instead of using them as protection. Originally a "survivor bet," expulsion from a tontine pool was later based on failure to pay premiums for any reason. "It is a tempting game; but how cruel!" *Papers Relating to Tontine Insurance,* The Connecticut Mutual Life Insurance Company, Hartford, Conn.: 1887.

27. Office Memorandum, Government Employees Insurance Corporation, Buffett-Falk & Co., October 9, 1951.

Chapter 17

1. Benjamin Graham, *The Memoirs of the Dean of Wall Street.* New York: McGraw-Hill, 1996. Anecdotal material from this source has been verified with Warren Buffett.

2. In 1915, members of the Grossbaum family, like many American Jews, began to anglicize their name to Graham in response to the anti-Semitism that flourished during and after World War I. Ben's family made the change in April 1917. Source: November 15, 2007, speech by Jim Grant to the Center for Jewish History on "My Hero, Benjamin Grossbaum."

3. Graham was born in 1894, the year of one of the biggest financial panics in American history, which was followed by the depression of 1896–97, the panic of 1901, the panic of 1903–04 ("Rich Man's Panic"), the panic of 1907, the war depression of 1913–14, and the postwar depression of 1920–22.

4. Benjamin Graham, *Memoirs.*

5. Ibid.

6. Ibid.

7. Traditionally, people came to Wall Street in one of two ways. Either they entered the family business by following a relative into the job, or, having no such connection, they "came up through the hawsehole," to use a nautical expression common on Wall Street at the time, starting young as a runner or board boy and working their way up, like Sidney Weinberg, Ben Graham, and Walter Schloss. Attending business school with the conscious intention of working on Wall Street was essentially unheard of until the early 1950s because most areas of finance, and especially the art of security analysis, had not developed as academic disciplines.

8. Details of Graham's early career are from Janet Lowe's *Benjamin Graham on Value Investing: Lessons from the Dean of Wall Street.* Chicago: Dearborn Financial Publishing, 1994.

9. Graham believed that one could be swayed by personality and salesmanship by going to meetings with a company's management, so this was partly a way of remaining dispassionate. But Graham was also not particularly interested in human beings.

10. Interview with Rhoda and Bernie Sarnat.

11. As cited by Lowe.

12. Benjamin Graham, *Memoirs.*

13. Ibid.

14. Interview with Jack Alexander.

15. In *Security Analysis, Principles, and Technique* (New York: McGraw-Hill, 1934), Benjamin Graham and Dodd stressed that there is no single definition of "intrinsic value," which depends on earnings, dividends, assets, capital structure, terms of the security, and "other" factors. Since estimates are always subjective, the main consideration, they wrote—always—is the margin of safety.

16. The apt analogy to Plato's cave was originally made by Patrick Byrne.

17. Often this was because the kind of undervalued stocks he liked were illiquid and could not be purchased in large positions. But Buffett felt that Graham could have followed a bolder strategy.

18. Interview with Jack Alexander.

19. Interview with Bill Ruane.

20. Interviews with Jack Alexander, Bill Ruane.

21. Schloss, in his memoir, wrote with warm affection of his wife, Louise, who "battled depression throughout her entire adult life." They remained married for fifty-three years, until she died in 2000.

22. Interview with Walter Schloss.

Chapter 18

1. Mary Monen, sister of Dan Monen, who would later become his lawyer.

2. Susie's parents were friends of Howard and Leila Buffett, but their children attended different schools, so they did not socialize.

3. Interview with Roberta Buffett Bialek. Susie was born June 15, 1932. Bertie was born November 15, 1933.

4. Earl Wilson was the saloon writer for the *New York Post*. In describing *Newsday* scribe Jimmy Breslin, *Media Life Magazine* defined a saloon writer as the purveyor of "a certain style of journalism that's peculiar to New York, and a bit peculiar in itself, where the writer journeys about the places where ordinary people can be found and writes of their visions of the human condition."

5. A well-known women-only residence still in operation today (at 419 W. 34th Street in New York City).

6. Vanita, in a Valentine letter to Warren, February 1991, poses the possibility that she "never liked cheese sandwiches and that I just ate them to please." (In this letter, as at some other times, she spells her middle name "May" instead of "Mae" as in her youth.)

7. This description came from various letters from Vanita, reminiscing about her dates with Warren—January 1, 1991, February 19, 1991, January 1, 1994, many undated; Buffett agrees.

8. Susan Thompson Buffett, as told to Warren Buffett in 2004. He does not remember this but adds that, of course, he wouldn't.

9. Buffett says that, despite her antics, he was never intimidated by Vanita. *"I wouldn't have had the guts to stick Pudgy in a wastebasket,"* he says. *"I mean, she'd have beaten the hell out of me."* For her part, Vanita later claimed to Fred Stanback that the incident never happened—although she did have some incentive to downplay the histrionic side of her personality to Fred.

10. As Charlie Munger puts it, Buffett narrowly missed a disastrous marriage when he "escaped the clutches of Vanita."

11. "A Star Is Born?" Associated Press, *Town & Country* magazine, September 24, 1977.

12. Information on William Thompson comes from a variety of sources, including interviews with Warren, Roberta, and Doris Buffett and other family members, and "Presbyterian Minister Reviews Thompson Book," *Omaha World-Herald,* January 5, 1967; "Old 'Prof' Still Feels Optimistic About Younger Generation," *Omaha World-Herald,* March 28, 1970; "W. H. Thompson, Educator, Is Dead," *Omaha World-Herald,* April 7, 1981; "O.U. Alumni Honor Dean," *Omaha World-Herald,* May 15, 1960.

13. As supervisor of the school system's IQ testing, Doc Thompson had access to and, according to Buffett, knew Warren's IQ. Indeed, the IQ test results for the three little Buffetts may have intrigued him, given their remarkably high—and remarkably similar—scores.

14. In an interview, Marge Backhus Turtscher, who attended these services, wondered what on earth motivated Thompson to make the long trip each Sunday to preach at this tiny church. Thompson also once published a book, *The Fool Has Said God Is Dead.* Boston: Christopher Publishing House, 1966.

15. Susan Thompson Buffett told this story to various family members.

16. In many patients, rheumatic fever causes mild to serious heart complications (in Howard Buffett's case, at least moderate complications), but based on her subsequent health history, Susan Thompson appears to have been among the 20–60% who escape significant carditis, or long-term damage to the heart.

17. Warren, Doris Buffett, Roberta Buffett Bialek, Susie Buffett Jr., and other Buffetts talk of this striking film.

18. Interview with Raquel "Rackie" Newman.

19. Al Pagel, "Susie Sings for More Than Her Supper," *Omaha World-Herald,* April 17, 1977.

20. Interviews with Charlene Moscrey, Sue James Stewart, Marilyn Kaplan Weisberg.

21. According to some high school classmates who asked not to be identified.

22. Interviews with Donna Miller, Inga Swenson. Swenson, who went on to become a professional actress, played Cornelia Otis Skinner opposite Thompson's Emily Kimbrough.

23. A composite taken from interviews with Inga Swenson, Donna Miller, Roberta Buffett Bialek, and John Smith, whose brother Dick Smith took Susie dancing.

24. Interviews with Sue James Stewart, Marilyn Kaplan Weisberg. Stewart, who was Sue Brownlee in high school, had access to a car and drove her best friend Susie to Council Bluffs for dates with Brown.

25. Interviews with Roberta Buffett Bialek, Warren Buffett, Doris Buffett, Marilyn Kaplan Weisberg.

26. "I don't think anything as exciting has ever happened to me," Bertie told the college newspaper. "This is what we sent her to Northwestern for?" wondered Howard.

27. The Wildcat Council acted as guides for campus visitors and leaders during New Student Week. Members joined by petitioning the council for membership (Northwestern University Student Handbook, 1950–1951).

28. Interview with Milton Brown, who says he would have depledged had the roles been reversed.

29. Interview with Sue James Stewart. Susie, a self-described "personal theist," flirted with Buddhism, a nontheistic religion, all her life and often referred to Zen or to herself as a "Zen person." It is fair to say she used the terms "Zen" and "theist" loosely.

30. Al Pagel, "Susie Sings…"

31. Interview with Roberta Buffett Bialek.

32. Interviews with Chuck Peterson, Doris Buffett.

33. Interview with Charlie Munger.

34. Interview with Milton Brown. In a minor footnote to the story, this was the only time Brown ever entered the Buffetts' house.

35. Interview with Sue James Stewart.

36. *"I can see her in those dresses now,"* Buffett says, a poignant statement from a man who does not know the color of his own bedroom walls.

37. "Debaters Win at Southwest Meet," *Gateway,* December 14, 1951.

38. "ASGD Plans Meet for New Members," *Gateway,* October 19, 1951.

39. Warren Buffett letter to Dorothy Stahl, October 6, 1951.

40. Susan Thompson Buffett, as conveyed to Warren Buffett.

41. Interview with Milton Brown.

42. The United States airlifted food and supplies into West Berlin during 1948 and 1949 during a Soviet blockade in which the Soviet Union attempted to seize the entire city, which had been partitioned after World War II.

43. Buffett recalls a literal three-hour lecture. A conversation of such length was almost certainly the result of him working himself up to ask the question while Doc Thompson carried on.

Chapter 19

1. The net gain on investments was $7,434. He also put $2,500 into the account that he'd saved from his pay working at Buffett-Falk.

2. Delving a little further into Buffett's reasoning about the valuation of an insurance business: *"The stock was trading around forty dollars and therefore the whole company was selling for about seven million. I figured the company would be worth as much as the premium volume, roughly, because they would get the investment income on 'float' that was pretty close to dollar-for-dollar, maybe with the premium income. Plus, they'd have the book value. So I figured it would always be worth at least as much as the premium. Now, all I had to do was get to a billion dollars of premium income and I was going to be a millionaire."*

3. This company later became ConAgra. Buffett-Falk had apparently managed a $100,000 preferred-stock offering for it as an investment banker—at the time not a trivial transaction.

4. Interview with Margaret Landon, the secretary at Buffett-Falk.

5. According to Walter Schloss in an interview, the Norman family, who were heirs of Julius Rosenwald of Sears, Roebuck, "received GEICO stock because they were big investors in Graham-Newman. When the

Normans wanted to put more money with Graham-Newman, they gave Ben Graham the GEICO stock he had distributed to them instead of putting cash in. Warren is out in Omaha, and he's buying GEICO. But Graham didn't know he was selling to Warren, and Warren couldn't figure out why Graham-Newman was selling it." The distribution of GEICO stock by Graham-Newman is also described in Janet Lowe's *Benjamin Graham on Value Investing: Lessons from the Dean of Wall Street.* Chicago: Dearborn Financial Publishing, 1994.

6. Interview with Bob Soener, who called him "Buffie" in those days.

7. As seen in a photograph taken in the classroom.

8. Interview with Lee Seeman.

9. People attended the class partly to get stock ideas. This was the only time he resembled Ben Graham in giving out ideas. He did so mainly because he had more ideas than money.

10. Interview with Margaret Landon. Her memory of him is in this posture, reading.

11. Office Memorandum, Cleveland Worsted Mills Company, Buffett-Falk Company, September 19, 1952.

12. Interview with Fred Stanback.

13. Buffett traded two stocks personally, Carpenter Paper and Fairmont Foods. While astute enough to set the firm up as a market maker and trade the stocks, he was immature (albeit witty) enough to refer to the CEO of Fairmont Foods, D. K. Howe, as "Don't Know Howe."

14. Bill Rosenwald later founded the United Jewish Appeal of New York.

15. Interviews with Doris Buffett, Roberta Buffett Bialek.

16. Interview with Fred Stanback.

17. Interview with Chuck Peterson.

18. Brig. Gen. Warren Wood of the 34th National Guard Division.

19. Interview with Byron Swanson.

20. Interview with Fred Stanback.

21. Susie told Sue Brownlee (Sue James Stewart) this the week after she returned from her honeymoon. Interview with Sue James Stewart.

22. Wahoo is best known as the birthplace of movie mogul Darryl F. Zanuck.

23. "Love Only Thing That Stops Guard," *Omaha World-Herald,* April 20, 1952.

24. Interview with Buffett. Also, Brian James Beerman, "Where in the Hell Is Omaha?" Americanmafia.com, March 21, 2004.

Chapter 20

1. General Douglas MacArthur made a halfhearted run for the nomination but was eclipsed by Taft. He and his former aide Eisenhower were bitter enemies.

2. Interview with Roberta Buffett Bialek.

3. David L. Dodd, Associate Dean, Columbia University, letter to Warren Buffett, May 20, 1952.

4. This was the same Robert Taft who had cosponsored the Taft-Hartley Act, much favored among businessmen but despised by broad swaths of Americans. In short, Taft represented the extreme end of the party, which made him less likely to capture moderate voters.

5. Ironically, many in this faction promoted tariffs, government farm supports, and tough labor laws desired by their small-business and farm constituents, even though this may have seemed inconsistent with their other views on government. Another famous member of this group was popular Nebraska Senator Ken Wherry, the "merry mortician," famous for malapropisms such as calling Indochina "Indigo China," addressing the chairman as "Mr. Paragraph," and offering his "unanimous opinion." *Time,* June 25, 1951. Wherry died shortly before the election.

6. The leaders of this wing of the party were Henry Cabot Lodge and Nelson Rockefeller, despised by Howard Buffett and like-minded Republicans as rich East Coast Ivy League elitists who abandoned core Republican principles to join forces with Democrats whenever it furthered their own pragmatic interests and those of "big business."

7. "Top GOP Rift Closed But Not the Democrats'," *New York Times,* September 14, 1952; Elie Abel, "Taft Rallies Aid for GOP Ticket," *New York Times,* October 5, 1952.

8. Howard Buffett wrote to former president Hoover, October 23, 1952: "I have no enthusiasm for Eisenhower, but your decision to support his election is good enough for me." He apparently changed his mind after this letter was written.

9. Interview with Roberta Buffett Bialek.

10. Interview with Katie Buffett, who recalled this conversation and found it amusing. "Warren's probably forgotten he told me that one," she said.

11. Susan Goodwillie Stedman, recalling personal interview with Susan Thompson Buffett conducted November 2001, courtesy of Susan Goodwillie Stedman and Elizabeth Wheeler.

12. Interview with Susan T. Buffett.

13. Interviews with Mary and Dick Holland, Warren Buffett.

14. Interviews with Racquel Newman, Astrid Buffett.

15. The IQ story is a family tale, but since Dr. Thompson was in charge of IQ testing for the whole school system, it has at least some credence. Within the family, Dr. Thompson often tested his daughters and grandchildren while he was creating new psychology and intelligence tests. Whatever her IQ, Dottie was considered no dummy.

16. This story is related in Leila Buffett's diary. Also, Gabe Parks, "Court Has Nomination Vote Vacancy," *Omaha World-Herald,* July 4, 1954.

17. "Buffett May Join Faculty at UNO," *Omaha World-Herald,* April 30, 1952; Buffett-Falk and Company announcement, *Omaha-World Herald,* January 9, 1953; "Talks on Government Scheduled at Midland," *Omaha World-Herald,* February 6, 1955; "Buffett Midland Lecturer in 1956," *Omaha World-Herald,* February 15, 1955.

18. Warren Buffett letter to "Pop" Howard Buffett, dated "Wednesday," presumed August 4, 1954. "Scarsdale G.I. Suicide, Army Reports the Death of Pvt. Newton Graham in France," *New York Times,* August 3, 1954. The entire text of the item read: "Frankfurt, Germany, Aug. 2 (Reuters)—Pvt. Newton Graham of Scarsdale, N.Y., committed suicide at La Rochelle, France, the United States Army announced

today." Newton—named after Sir Isaac Newton—was the second of Graham's sons to be named Isaac Newton; the first had died of meningitis at age nine. Noting Newton's increasing mental instability, which he labeled "highly neurotic, even probably schizophrenic," Graham had written letters trying to get him discharged from the army, but failed. (Benjamin Graham, *The Memoirs of the Dean of Wall Street.* New York: McGraw-Hill, 1996.)

19. Susie Buffett Jr. says she had a crib.

20. Using the term "pay" loosely, since all of the earnings are not actually paid out as a dividend. This distinction was once the subject of heavy academic debate as to the discount that should be imputed to a stock's valuation for earnings that were not paid out. The premium assigned to companies that pay dividends has waned for a number of reasons. See also the reference to "The Frozen Corporation" in Chapter 46, "Rubicon."

21. Interview with Fred Stanback.

22. His personal investment return that year was 144.8%, compared to 50.1% for the DJIA.

23. Union Underwear was the predecessor to Fruit of the Loom.

24. Buffett recalled this classic story in an interview.

25. Interview with Sue James Stewart.

26. Interview with Elizabeth Trumble.

27. Interview with Roxanne Brandt.

28. *I Love Lucy,* Season 1, Episode 6, November 11, 1951.

29. Buffett's exact quote was *"I can see her pulsing and moaning as she said, 'Tell me more…'"*

Chapter 21

1. Berkshire Hathaway chairman's letter, 1988.

2. The tax code exemption applied to LIFO inventory liquidations. For tax purposes Rockwood used LIFO accounting, which let it calculate profits using the *most recent* cocoa-bean prices, which minimized taxes. Correspondingly, cocoa beans were carried in inventory at old prices. A large taxable profit would therefore occur if it sold the inventory.

3. Pritzker created a business conglomerate through his investing activities, but is best known as founder of the Hyatt hotel chain.

4. At the onset of the exchange period, Accra cocoa beans, which made up half of Rockwood's 13-million-pound pile, were trading at $0.52 a pound. The price dropped to $0.44 per pound by the conclusion of the exchange period. The price of these beans had hit a high of $0.73 per pound in August 1954, causing candy companies to shrink the size of their 5¢ candy bars. George Auerbach, "Nickel Candy Bar Wins a Reprieve," *New York Times,* March 26, 1955; "Commodity Cash Prices," *New York Times,* October 4 and 20, 1954.

5. Letter to Stockholders of Rockwood & Co., September 28, 1954.

6. From the 1988 chairman's letter in the Berkshire annual report to shareholders, which contains a brief description of the Rockwood transaction.

7. The speculator's return on the contract also reflects his funding cost. For example, if the speculator broke even on a three-month contract—net of his fee—the contract would actually be unprofitable, considering the speculator's funding cost.

8. In the futures market, the difference between a speculator and a hedger (or "insured") is essentially whether an underlying position in the commodity exists to be hedged.

9. Interviews with Tom Knapp and Walter Schloss, as well as Buffett.

10. Warren Buffett letter to David Elliott, February 5, 1955.

11. Based on its profile in *Moody's Industrial Manual,* Rockwood traded between $14.75 and $85 in 1954 and between $76 and $105 in 1955. Buffett held on to the shares through 1956. Profit on the trade is estimated. Rockwood traded above $80 a share during early 1956, based on the Graham-Newman annual report.

12. In the letter to David Elliott noted above (February 5, 1955), Buffett explains that Rockwood is his second-largest position (after Philadelphia & Reading, which he did not disclose) and writes that Pritzker "has operated quite fast in the past. He bought the Colson Corp. a couple years ago and after selling the bicycle division to Evans Products sold the balance to F. L. Jacobs. He bought Hiller & Hart about a year ago and immediately discontinued the pork-slaughtering business and changed it into a more or less real estate company." Pritzker, he writes, "has about half the stock of Rockwood, which represents about $3 million in cocoa value. I am quite sure he is not happy about sitting with this kind of money in inventory of this type and will be looking for a merger of some sort promptly." He had studied not just the numbers but Jay Pritzker.

13. Initially he had bought the stock from Graham-Newman when he was a stockbroker, after a minor mistake on an order from them caused them to DK ("don't know," or repudiate) the order. Warren kept the stock.

14. Before 2000, investors and analysts routinely sought and received nonpublic information that would be an advantage to them in trading stocks. This gradual flow of information, which benefited some investors at the expense of others, was considered part of the efficient workings of the capital markets and a reward for diligent research. Warren Buffett and his network of investor friends profited significantly from the old state of affairs. Ben Graham was questioned extensively about this practice before Congress in 1955. He commented that "a good deal of information from day to day and month to month naturally comes to the attention of directors and officers. It is not at all feasible to publish every day a report on the progress of the company…on the other hand, as a practical matter, there is no oath of secrecy imposed upon the officers or directors so that they cannot say anything about information that may come to their attention from week to week. The basic point involved is that where there is a matter of major importance it is generally felt that prompt disclosure should be made to all the stockholders so that nobody would get a substantial advantage in knowing that. But there are all degrees of importance, and it is very difficult to determine exactly what kind of information should or must be published and what kind should just go the usual grapevine route." He added that all investors may not be aware of the grapevine, but, "I think that the average experienced person would assume that some people are bound to know more about the company [whose stock they are trading] than he would, and possibly trade on the additional knowledge." Until 2000 that was, in effect, the state of the law.

While a full discussion of insider trading is beyond the scope of this book, the theory of insider trading was promulgated with SEC Rule 10b-5 in 1942, but "so firmly entrenched was the Wall Street tradition of taking advantage of the investing public," as John Brooks puts it in *The Go-Go Years,* that the rule was not enforced until 1959, and it was not until the 1980s that anyone seriously questioned the duties of people other than insiders under insider-trading laws. Even then, the Supreme Court affirmed, in *Dirks v. SEC,* 463 U.S. 646 (1983), analysts could legitimately tell their clients this type of information, and the Supreme Court also noted in *Chiarella v. United States,* 445 U.S. 222 (1980), that "informational disparity is inevitable in the securities markets." To some extent, there was understood to be some benefit to the market of a gradual

leakage of inside information; in fact, how else was the information to get out? The practice of business public relations and conference calls had not developed.

In these 1980s cases, however, the Supreme Court defined a new "misappropriation" theory of insider trading, in which inside information that was misappropriated by a fiduciary could lead to liability if acted upon. Then, largely in response to the Bubble-era proliferation of "meeting and beating consensus" earnings and the "whisper numbers" that companies began to suggest to favored analysts that they were going to earn, in 2000, through Regulation FD (Fair Disclosure), the SEC broadened the misappropriation theory to include analysts who selectively receive and disseminate material nonpublic information from a company's management. With the advent of Reg. FD, the "grapevine" largely ended, and a new era of carefully orchestrated disclosure practices began.

15. At the end of 1956, after the dividend was paid, Warren owned 576 shares trading at $20, worth $11,520.

16. He registered the securities in his own name, rather than his brokers', so the checks came straight to his home.

17. Interviews with George Gillespie, Elizabeth Trumble, who heard this story from Madeline. Warren heard it for the first time at his fiftieth birthday party, from Gillespie. Apparently Susie had never mentioned it to him.

18. More than five decades later, Howie recalls this as his first memory. While that may seem improbable, in "Origins of Autobiographical Memory," Harley and Reese (University of Chicago, *Developmental Psychology,* Vol. 35, No. 5, 1999) study theories of how childhood memories are recalled from the earliest months of life and conclude that this phenomenon does occur. One of the explanations is parents who repeat stories to their children. A gift from Ben Graham—probably significant to Warren—might plausibly be recalled by Howie from infancy because at least one parent helped him imprint it solidly in memory by discussing it so much.

19. Interview with Bernie and Rhoda Sarnat.

20. This story also is cited in Janet Lowe's *Benjamin Graham on Value Investing: Lessons from the Dean of Wall Street.* Chicago: Dearborn Financial Publishing, 1994.

21. Interview with Walter Schloss.

22. Warren Buffett letter to the Hilton Head Group, February 3, 1976.

23. Schloss was starting the partnership with $5,000 of his own capital, a risky arrangement that left him nothing on which to live. Buffett got him help with housing from Dan Cowin. Ben Graham put in $10,000 and had some of his friends do so too; eight of Schloss's friends put in $5,000 each. Schloss charged 25% of profits, "but that's it. If the market went down, we would have to make up the loss until my partners were whole."

24. Knapp was a security analyst at Van Cleef, Jordan & Wood, an investment adviser.

25. Interview with Tom Knapp.

26. Interview with Ed Anderson.

27. Ibid.

28. Graham was born May 9, 1894. He decided to shut down Graham-Newman when he was sixty-one, but the last Graham-Newman shareholder meeting was held on August 20, 1956.

29. Jason Zweig says in a July 2003 *Money* article, "Lessons from the Greatest Investor Ever," that "From

1936 to 1956, at his Graham-Newman mutual fund, he produced an average annual gain of more than 14.7% vs. 12.2% for the overall market—one of the longest and widest margins of outperformance in Wall Street history." This record does not reflect the impressive performance of GEICO, which was distributed to the shareholders in 1948.

Chapter 22

1. At times he had said he wanted to be a millionaire by age thirty.

2. Interview with Ed Anderson.

3. *"Newman and Graham predated A. W. Jones, which everybody thinks is the first hedge fund,"* Buffett says. A.W. Jones is best known as the first promoter of the concept of hedging the risk in stocks with short sales. However, its fee structure, partnership arrangement, and flexible investing approach—that is, the classic hedge fund as the term is technically defined—were pioneered much earlier, by Graham if not others as well.

4. Interview with Chuck Peterson.

5. The first partnership agreement provided: "Each limited partner shall be paid interest at the rate of 4% per annum on the balance of his capital account as of December 31 of the immediately preceding year as shown by the Federal Income Tax Return filed by the partnership applicable to said year's business, said interest payments to be charged as expenses of the partnership business. In lieu of a separate computation of interest for the period ending December 31, 1956, each limited partner shall be paid 2% of his original capital contribution, said payments to be charged as expense of the partnership business for said period. In addition each of the limited partners shall share in the overall net profits of the partnership, that is, the net profits of the partnership from the date of its formation to any given point of time in the proportions set opposite their respective names." The total interest of the partners added up to $^{21}/42$ or 50% of the total interest in the earnings (Certificate of Limited Partnership, Buffett Associates, Ltd., May 1,1956). The agreement to share in the losses was an amendment to the partnership agreement on April 1, 1958.

6. According to Joyce Cowin, both Buffett and her own husband, Dan Cowin, who had been introduced to Buffett by Fred Kuhlken, ran money separately for Gottschaldt and Elberfeld.

7. Interview with Chuck Peterson.

8. Some of these remarks were made at the 2003 speech to Georgia Tech students, the rest in interviews with the author.

9. Hartman L. Butler Jr., "An Hour with Mr. Graham," March 6, 1976, interview included in Irving Kahn and Robert Milne, *Benjamin Graham: The Father of Financial Analysis.* Occasional Paper No. 5, The Financial Analysts Research Foundation, 1977.

10. Interview with Tom Knapp.

11. "Tourist Killed Abroad, Portugal-Spain Highway Crash Fatal to Long Island Man," *New York Times,* June 23, 1956. Kuhlken had been on a yearlong trip. The other passenger, Paul Kelting, was listed in critical condition.

12. Sloan Wilson, *The Man in the Gray Flannel Suit.* New York: Simon & Schuster, 1955.

13. Interview with Susie Buffett Jr.

14. From *Headliners & Legends,* MSNBC, February 10, 2001.

15. Interview with Charlie Munger.

16. Or thereabouts.

17. Interview with Ed Anderson.

18. According to Tom Knapp, one thing Dodge and Buffett had in common was their tightfistedness. Even when he later became one of Buffett's richest partners, Homer Dodge would angle for a free canoe from a canoe maker. He knew every route into New York City from both La Guardia and JFK airports, and took convoluted trips by bus and subway and on foot rather than hire a cab.

19. The Dodges chose a slightly different deal. Buffett's share of the profits would be only 25%, but the amount he could lose was limited to his capital, initially only $100. Certificate of Limited Partnership, Buffett Fund, Ltd., September 1, 1956.

20. Cleary split profits over 4%, while Buffett was exposed to the extent of any arrears. Certificate of Limited Partnership, B-C Ltd., October 1, 1956. In 1961, B-C Ltd. was folded into Underwood Partnership, Ltd.

21. Buffett Partnership files, "Miscellaneous Expense" and "Postage and Insurance Expense," 1956 and 1957.

22. Warren Buffett's first letter to partners, December 27, 1956.

23. During the war, people bought Liberty Bonds, which paid low interest rates, as a patriotic duty. When rates subsequently rose, the bonds traded "below par"—face value. Stock promoters offered shares to Liberty Bond owners in exchange for the par value of the bonds. Thus bondholders thought they were getting $100 worth of stock for a bond selling in the market for, say, $85, when in fact the stock was worth little if anything. Salesmen also promised some buyers board seats, according to Hayden Ahmanson, who told Buffett this.

24. From 1928 to 1954, the manual was published in five volumes annually as *Moody's Manual of Investments,* one volume each for government securities; banks, insurance companies, investment trusts, real estate, finance and credit companies; industrial securities; railroad securities; and public-utility securities. In 1955, Moody's began publishing *Moody's Bank and Finance Manual* separately.

25. Buffett says Hayden Ahmanson gave him this version of events.

26. Buffett: *"He was my partner in National American insurance. Dan didn't have a lot of money, so he was using his money that he had originally planned to put in the partnership, and borrowed some money too."*

27. Under the Williams Act, passed in 1968, you could not do this today, nor could Howard Ahmanson buy back the stock piecemeal. The act requires buyers to make a "tender offer" that puts all sellers on a level playing field under the same price and terms.

28. According to Fred Stanback, when Buffett had "bought all he could pay for," he also let Stanback start buying.

29. A year later, Buffett sold the National American stock for around $125 (to the best of his memory) to J. M. Kaplan, a New York businessman who had reorganized and headed Welch's Grape Juice in the 1940s and '50s and was later known for his philanthropy. Kaplan eventually sold the stock back to Howard Ahmanson.

30. See, for example, Bill Brown, "The Collecting Mania," *University of Chicago Magazine,* Vol. 94, No. 1., October 2001.

31. Interview with Chuck Peterson. This was insurance proceeds from her husband's estate. By then, Buffett had decided to offer his partners several choices of risk versus reward. Mrs. Peterson chose a fee structure

that shifted more of both to Warren. He had to beat the market by 6%, not 4%, before earning anything. But he got one third of everything he made above that. Under this structure, only Warren's capital was at risk for the 25% payback-of-losses provision. Certificate of Limited Partnership, Underwood Partnership, Ltd., June 12, 1957.

32. Arthur Wiesenberger, *Investment Companies.* New York: Arthur W. Wiesenberger & Co., released annually from 1941.

33. United States & International Securities Corp. was formed amid much fanfare in October 1928 by Dillon, Read & Co. and promptly sank into ignominy, becoming a cigar butt by 1950. Clarence Dillon, the founder of Dillon, Read, was called before the Pecora hearings in 1933 to explain how Dillon, Read obtained control of US&IS and US&FS, which were capitalized at $90 million, for $5 million.

34. Quote is from Lee Seeman. Buffett confirms the substance of the statement. The intriguing question is who or what prompted Wiesenberger to make the phone call.

35. Lee Seeman's recollection in an interview is that Dorothy Davis made the comparison.

36. Buffett, recalling a conversation with Eddie Davis.

37. Dacee resembled the Buffett Fund. Buffett was credited 25% of any profits over a 4% hurdle rate. Certificate of Limited Partnership, Dacee Ltd., August 9, 1957.

38. Congressional records note a Washington, D.C., furniture store was giving away shares of uranium stock with any purchase for a Washington's Birthday sale. (Stock Market Study, Hearings before the Committee on Banking and Currency of the United States Senate, March 1955.)

39. Monen had also invested in a small real estate partnership with Warren and Chuck Peterson. The money from this, a profit from National American, and likely some personal savings had, in short order, made him one of Buffett's largest partners.

40. Above a 4% to 6% "bogey." He benchmarked himself against the rate of long-term government bonds, telling his partners that if he could not do better than that, he should not get paid. The wide range of profit-sharing reflected the varying level of risk Warren was taking. In the partnerships that paid him the most, he also had unlimited liability to pay back losses.

41. Buffett was charging 25% of the partnership's appreciation in excess of 6%.

42. Meg Mueller, in an interview, recalls its size relative to other houses on the street at the time.

43. Reynolds was a city councilman. "Sam Reynolds Home Sold to Warren Buffett," *Omaha World-Herald,* February 9, 1958. "Buffett's Folly" was referred to in a letter to Jerry Orans, March 12, 1958, cited in Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

44. Interview with Susie Buffett Jr.

45. Interview with Howie Buffett.

46. Pyelonephritis, sometimes associated with pregnancy.

47. As quoted in Lowenstein, *Buffett*. Billig is now deceased.

48. Interview with Charlie Munger.

49. In interviews, Dr. Marcia Angle recalls the TV being acquired in the late 1950s and how much it impressed her father. Kelsey Flower and Meg Mueller recall its impact on the neighborhood.

50. Interviews with Howie Buffett, Peter Buffett, Susie Buffett Jr.

51. Interview with Thama Friedman. Laurette Eves was the third partner.

52. Interview with Howie Buffett.

53. Kuhlken had introduced Cowin to Buffett in 1951 on one of Buffett's trips back to New York after his graduation from Columbia.

54. From Buffett's eulogy for Cowin.

55. From Joyce Cowin's eulogy for Cowin.

56. Marshall Weinberg, Tom Knapp, Ed Anderson, Sandy Gottesman, Buffett, and others contributed to this portrait of Cowin.

57. *"He lent me unsecured. A dollar of short-term loss offset two dollars of long-term gain for tax purposes, and you could buy a mutual fund that was going to pay a long-term capital-gains dividend and redeem it immediately thereafter to offset a long-term gain going into the end of the year. I bought a combination of long-term gain and short-term loss, which, though equal in amount, had different effects on your tax return. It was all legit then; you can't do it anymore. It probably saved me a thousand dollars. Boy, it was huge,"* says Buffett.

58. Interview with Joyce Cowin.

59. This was an experimental town built to house 1,800 families in low-cost units. Numerous government properties were auctioned off after World War II. "House Passes Bill to Speed Greenbelt Sale," *Washington Post,* April 14, 1949; "U.S. Sells Ohio Town It Built in Depression," *New York Times,* December 7, 1949; "Greenbelt, Md., Sale Extended for 30 Days," *Washington Post,* May 31, 1952.

60. Chuck Peterson paraphrased this quote from the version of the story he heard. It is probably correct in substance, but, as with all quotes recalled from memory, the exact wording is in doubt.

Chapter 23

1. "A. C. Munger, Lawyer, Dies," *Omaha World-Herald,* July 1, 1959.

2. The obituary of Henry A. Homan, son of George W. Homan, in the *Omaha World-Herald,* March 22, 1907, mentions that Homan, who was twelve years older than Judge Munger, was a close friend of the judge. The Homan and Buffett sides of the families, however, were not close.

3. "33 Years a Federal Judge," *Omaha World-Herald,* March 12, 1939.

4. Charles Munger letter to Katharine Graham, November 13, 1974. When Judge Munger died, this same aunt Ufie (Ruth) reportedly made the bizarre claim that he must have been taken by God's grace because of a mistake he'd made recently in arithmetic. She said she knew "he couldn't stay on after that."

5. Lowe, *Damn Right!: Behind the Scenes with Berkshire Hathaway Billionaire Charlie Munger.* New York: John Wiley & Sons, 2000. Lowe's biography, which is based on extensive family interviews, was the author's principal source for the Munger family history.

6. Said approvingly in Lowe, *Damn Right!*

7. Interview with Lee Seeman.

8. Interview with Mary McArthur Holland.

9. Interview with Howard Jessen, a friend of the Buffetts'.

10. His grandfather, a prominent Omaha lawyer, was a friend of Dean Roscoe Pound, the dean of Harvard Law School.

11. Munger made no effort to burnish a résumé by, for example, joining the *Law Review.* In an interview, he described himself as relatively aloof.

12. His father also gave him this advice.

13. Lowe, *Damn Right!*

14. As quoted in Lowe, *Damn Right!*

15. Munger, as told to Janet Lowe in *Damn Right!*

16. In *Damn Right!,* Munger compared getting married to investing. Nancy said he was "uptight" about showing emotions. His son Charles Jr. said, "There are some things my dad could deal with better if he faced them more" but "he just walks away."

17. Munger, as quoted in Lowe, *Damn Right!*

18. Ibid.

19. In *Damn Right!,* Nancy says that Charlie "was not much of a helpmate around the house." For her seventieth birthday, Buffett says he went to a pawn shop and got her a Purple Heart.

20. Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

21. Lowe, *Damn Right!*

22. Interview with Charlie Munger.

23. Interview with Lee Seeman.

24. In a year when the Dow was up 38.5%, Warren had managed to beat it, taking minimal risk.

25. In addition to his $100 stake in Buffett Associates, Buffett had later put $100 into each of his other partnerships: Buffett Fund, B-C, Underwood, Dacee, Mo-Buff, and Glenoff.

26. Interview with Lee Seeman.

27. This version differs from some others that have been published. For example, Susie Buffett has said that she was present. Several writers have set the meeting at a dinner at Johnny's Café. Roger Lowenstein, however, also set the meeting at the Omaha Club. Most likely, other versions are conflations of later events. To the author, Seeman's version is the most detailed yet has the least embellished air.

28. Interview with Charlie Munger. The dinner is reconstructed from interviews with Buffett and Munger, whose memories are hazy. Nancy Munger doesn't remember. The wives were introduced soon after the first meeting, and Johnny's is the most likely location. Buffett recalls Munger's self-intoxication clearly.

Chapter 24

1. Estimated. Buffett was managing $878,211 at the end of 1958 in six partnerships. The $50,000 Glenoff

Partnership was formed in February 1959. By the end of 1959, the partnerships' market value had grown to $1,311,884. His personal funds and Buffett & Buffett increased this total.

2. Sanborn sent its customers paste-over revisions each year showing new construction, changed occupancy, new fire-protection facilities, and changed structural materials. A new map was published every few decades. Buffett took note of the company, as far as he recalls, when a large block of stock came up for sale. The widow of the deceased president was reportedly selling 15,000 shares because her son was leaving the company. Phil Carret owned 12,000 shares.

3. Five or ten shares apiece, forty-six shares in total.

4. Buffett had become friendly with the company's CEO, Parker Herbell, whom he said the rest of the board treated as an "errand boy." Herbell supported the plan to separate the investments from the map business, and had facilitated some of its underpinnings, such as this study.

5. "It does not make sense to have management, consultants, and major stockholders in complete agreement regarding a course of action but unable to proceed because of directors owning an insignificant amount of stock." Warren Buffett letter to C. P. Herbell, September 25, 1959.

6. In those days, appreciated shares could be exchanged for a company's own shares. So a company could get rid of the capital-gains tax that was inherent in an operation if it just sold stock from time to time.

7. As part of the deal, the Buffett partnerships agreed to tender their stock.

8. Interview with Doris Buffett.

9. Interview with Kelsey Flower, a childhood friend of Susie Jr.'s.

10. Interview with Dick and Mary Holland.

11. Interview with Peter Buffett.

12. Interview with Howie Buffett.

13. Ibid.

14. *Gateway,* May 26, 1961.

15. "Paul Revere's Ride," Henry Wadsworth Longfellow. Listen my children, and you shall hear of the multitudes rescued by Susan Buffett.

16. From remarks made by Eisenberg at Susie's funeral.

17. According to his autobiography, *Stranger to the Game* (written with Lonnie Wheeler, New York: Penguin, 1994), Bob Gibson lived in Omaha in the off season. He talks about playing basketball in Omaha with a white team in 1964, traveling to Iowa for games, and hanging out at a bar on North 30th Street. The bartender wouldn't serve him.

18. Howard Buffett quoted in Paul Williams, "Buffett Tells Why He Joined Birch Society," *Benson Sun,* April 6, 1961.

19. The Christian Anti-Communist Crusade was founded in 1953 by "a crisp, energetic, self-confident Austrian," Fred Schwarz, who was a physician, psychiatrist, and lay preacher. It used media to spread its anti-Communist philosophy. Cabell Phillips, "Physician Leads Anti-Red Drive with 'Poor Man's Birch Society,'" *New York Times,* April 30, 1961. See the CACC website, http://www.schwarzreport.org/.

20. Leila Buffett letter to Dr. Hills, December 10, 1958.

21. Leila Buffett to Mrs. Kray, May 23, 1960.

22. Interview with Susie Buffett Jr. and Howie Buffett. They recall their father's behavior during this period as routine and, with hindsight, as a form of denial.

23. Interview with Howie Buffett.

24. Interview with Chuck Peterson.

25. According to Chuck Peterson, Carol Angle "did not hear well." This is a example of Buffett's raconteuring. She says she had progressive hearing loss.

26. Interview with Lee Seeman.

27. Interview with Dick Holland.

28. Interviews with Frank Matthews Jr. and Walter Schloss, who agree that Schloss introduced them on the street corner.

29. This is how hedge funds are commonly managed to stay within the legal investor limit today.

30. George Payne was also a founding member of this partnership. By then, B-C had been folded into Underwood. Along with the ten partnerships, Warren and his father were still operating Buffett & Buffett.

31. The Dow's results include dividends received. Note that this was the performance for the partnership before Warren's fees.

32. Interview with Chuck Peterson.

33. Interviews with Kelsey Flower, Meg Mueller.

34. Interview with Stan Lipsey.

35. Buffett was 31 on January 1, 1962, but his personal investments and gains in the partnership had taken him past the million-dollar mark months earlier, when he was still 30.

36. Interview with Bill Scott.

37. Buffett waived his fee for Scott, one of the two most lucrative arrangements he ever made with an employee. (See Henry Brandt in "Haystacks of Gold" and "Folly" for the other.)

38. He put in everything except his investment in Data Documents, a personal investment in a private company.

39. Letter to partners, July 6, 1962. In the second quarter of 1962, the Dow fell from 723.5 to 561.3, or 23%. In the first half of that year, the partnership saw a loss before payments to partners of 7.5%, compared with a loss of 21.7% including dividends for the Dow—the partners had a14.2% outperformance.

40. Buffett's phrase is a clever reworking of Graham's original. In *The Intelligent Investor*: "The sovereign virtue of all formula plans lies in the compulsion they bring upon the investor to sell when the crowd is buying and to buy when the crowd lacks confidence" (*Intelligent Investor,* Part I: General Approaches to Investment VI: Portfolio Policy for the Enterprising Investor: The Positive Side, 1949 edition). And in *Security Analysis*: "It would require bond investors to act with especial caution when things are booming and with greater confidence when times are hard" (*Security Analysis,* Part II: Fixed-Value Investments, XI:

Specific Standards for Bond Investment, 1940 edition).

Chapter 25

1. Warren Buffett typewritten file memo, undated.

2. Warren Buffett letter to Bob Dunn, June 27, 1958.

3. Note from Jack Thomsen to Warren Buffett, March 8, 1958: "I think we have to be realistic and reorganize on a basis that has a reasonable chance of working…the only thing that Clyde is concerned about is prestige…. Hale received a letter from Clyde yesterday to notify him that he was being removed as trustee of his estate. I am certain the same rancor is and will be held for all of us who have dared to oppose him…. I do feel sorry for him in his present predicament but I do not think we can correct our problems with sympathy."

4. Interview with Verne McKenzie, who says Buffett explained this to him when he hired him. Without a public exit strategy, this is one of only two ways to realize the value of the assets. Buffett had not yet figured out the other one, as the reader will see.

5. Interview with Walter Schloss.

6. Warren Buffett letter to Clyde Dempster, April 11, 1960.

7. Warren Buffett note to Bob Dunn, June 27, 1958: "…has become increasingly less active in the business and it appeared the company was just drifting with him not interested and no one else having the authority to do anything…. We finally got the job accomplished by letting Clyde stay as president." He gave Jack Thomsen, executive vice president, temporary operating authority.

8. Interview with Walter Schloss.

9. At $30.25 per share. Warren Buffett letter to Dempster shareholders, September 7, 1961.

10. Warren Buffett letter to partners, July 22, 1961.

11. "Dempster had earned good money in the past, but was currently only breaking even. "We continued to buy the stock in small quantities for five years. During most of this period I was a director and was becoming consistently less impressed with the earnings prospects under existing management. However, I also became more familiar with the assets and operations and my evaluation of the quantitative factors remained very favorable," thus leading him to continue buying stock. Letter to partners, January 24, 1962.

12. And water-system parts—as the demand for windmills was waning.

13. "We had parts for windmills and certain farm equipment," says Scott, "where we had a lock on the business and by repricing it could stop losing money down there. And we were successful to some degree."

14. January 18, 1963.

15. Interview with Bill Scott.

16. "Still a Chance City Can Keep Dempster," *Beatrice Daily Sun,* September 1, 1963; "Drive to Keep Dempster Rolls," *Omaha World-Herald,* September 30, 1963.

17. As Buffett's successor, Dempster's chairman W. B. McCarthy, put it, "We understand, as I am sure you do, that a number of the people in Beatrice do not recognize the fine, necessary job that you and Harry accomplished with Dempster." W. B. McCarthy letter to Warren Buffett, November 19, 1963.

18. Of the $2.8 million total financing, $1.75 million went to pay the sellers and the remainder to expand the operation. "Launch 11th Hour Effort to Keep Dempster Plant Here," *Beatrice Daily Sun,* August 29, 1963.

19. "Beatrice Raises $500,000," *Lincoln Evening Journal,* September 3, 1963; "Fire Sirens Hail Victory, Beatrice Gets Funds to Keep Dempster," *Omaha World-Herald,* September 4, 1963; "Contracts for Dempster Sale Get Signatures," *Beatrice Daily Sun,* September 12, 1963.

20. The partnership made $2.3 million, almost three times its investment. Buffett changed the name of the holding company to First Beatrice Corp. and moved its headquarters to Kiewit Plaza.

Chapter 26

1. The speakers appeared as individuals who happened to belong to different groups rather than "representatives" of their races and faiths. All went well, except once, says Doris Buffett, when a Protestant panelist started telling the Catholic and the Jew that they were going to hell.

2. The black workers were squeezed out of jobs as Omaha's packinghouse industry shrank. Marginalized into a ghetto north of downtown called the Near North Side, they lived in dilapidated, aging tenements for which unscrupulous landlords charged high rents. In 1957, the Omaha Plan, a communitywide study, proposed redevelopment of the Near North Side, but bond issues were defeated. A budding civil-rights movement led by college students at Creighton University, the Urban League, and other civic groups had worked to improve black employment and end segregation of teachers in the public schools since 1959.

3. Interview with Susie Buffett Jr., who wondered what good the police whistle was going to do.

4. Interview with Peter Buffett.

5. Interview with Doris Buffett. Viktor E. Frankl, *Man's Search for Meaning.* Boston: Beacon Press, 1962.

6. Interview with Sue James Stewart.

7. Alton Eltiste, "Miss Khafagy Gives Views on Homeland," *Gateway,* October 5, 1962.

8. This image of the crossing guard may surprise modern readers, but in the United States until the latter part of the twentieth century, children were traditionally given significant freedom and responsibility.

9. Interview with Howie Buffett.

10. Howie and Susie Jr. describe themselves and their relationship this way in interviews.

11. This composite picture of the Buffett household is based on interviews with Susie Buffett Jr., Howie Buffett, and Peter Buffett.

12. Interview with Meg Mueller. "My mom has commented on that several times over the years," she says.

13. Interview with Bill Ruane.

14. Interview with Dick Espenshade. One of the founding lawyers, Jamie Wood, joined from another firm.

15. Interview with Ed Anderson.

16. The example has been simplified for ease of understanding the concept of leverage. Obviously the exact return on capital depends on how long it took to make the profit, and on the funding rate.

17. Interview with Rick Guerin in Janet Lowe, *Damn Right!: Behind the Scenes with Berkshire Hathaway Billionaire Charlie Munger.* New York: John Wiley & Sons, 2000.

18. This description is from Ed Anderson.

19. Interview with Ed Anderson.

20. Interview with Charlie Munger. Guerin's seamstress mother died when he was a teenager.

21. Interviews with Rick Guerin, Ed Anderson.

22. Janet Lowe, *Damn Right!*

23. Interview with Ed Anderson. Guerin doesn't remember this specific incident but says it sounds likely.

24. Anderson takes the blame for being too obtuse to read Munger's mind, rather than blaming Munger for not explaining things to him.

25. Interview with Ed Anderson.

26. Along with Munger, Ed Anderson recalls this extraordinary trade. Munger says the story is true in substance. Buffett also recalled the reasoning.

27. Interview with Ed Anderson, who suggested the word "pretender" because, as he put it, "Charlie would never feel like he was an 'apprentice.'"

28. Ira Marshall relates Munger's confusion with names in *Damn Right!*

29. Interview with Ed Anderson. This term was commonly used among Buffett's friends. He referred to "coattail riding" in his partnership letter of January 18, 1963.

30. Buffett also recalls Munger hyperventilating at his own jokes.

31. Charles T. Munger letter to Katharine Graham, December 9, 1974.

32. Ibid.

33. In 1953, Buffett sold copies of this report for $5.

34. Buffett had also let Brandt in on one lucrative private investment, the Mid-Continental Tab Card Company. While Buffett gave up his override on Brandt's money, the deal was a win/win.

35. "There's got to be a warehouse full of these somewhere," said Bill Ruane in an interview, but the author never saw it.

36. Bill Ruane introduced Buffett to Fisher's ideas. Philip A. Fisher, *Common Stocks and Uncommon Profits.* New York, Evanston, and London: Harper & Row, 1958. ("Scuttlebutt" is a nautical term for a barrel with a hole in it used to hold the sailors' drinking water.)

37. The market for soybean oil was not large, a key element in the scheme. It would be impossible for a single individual to amass enough capital to corner the market for, say, oil or treasury bills.

38. Most accounts published about the scandal incorrectly refer to oil floating on top of water in the tanks.

39. Mark I. Weinstein, "Don't Leave Home Without It: Limited Liability and American Express," Working paper, American Law & Economics Association Annual Meetings, Paper 17, *Berkeley Electronic Press,* 2005, p. 14–15, is the source that American Express was certifying more warehouse receipts than the Department of Agriculture said existed in salad oil.

40. Haupt was a securities dealer who traded both stocks and commodities and was a member of the NYSE; thus, he was required to meet the exchange's net capital rules (which state that capital must be $^1/20$ of its total liabilities). SEC Rule 15c3-1 regulates broker-dealer net capital. Under the Aggregate Indebtedness Standard, 2% of net capital is required today, compared to 5% in the 1960s. The New York Stock Exchange paid $10 million to cover its customers' losses. H. J. Maidenberg, "Lost Soybean Oil Puzzles Wall St.," *Wall Street Journal,* November 20, 1963.

41. Equivalent to 2.9% of its value.

42. The Stock Exchange had closed mid-session on August 4, 1933, due to a tear-gas prank. Some consider the Kennedy assassination closing to be the first "real" closing of the market.

43. John M. Lee, "Financial and Commodities Markets Shaken; Federal Reserve Acts to Avert Panic," *New York Times,* November 23, 1963.

44. H. J. Maidenberg, "Big Board Ends Ban on Williston, Walston and Merrill Lynch Are Instrumental in the Broker's Reinstatement, Haupt Remains Shut, Effect of Move Is Swept Aside by Assassination of President Kennedy," November 24, 1963. The soybean-oil drama, including the American Express role, peaked during a period of about a week following the assassination.

45. American Express at the time was the only major U.S. public company to be capitalized as a joint stock company rather than a limited liability corporation. This meant its shareholders could be assessed for deficiencies in capital. *"So every trust department in the United States panicked,"* recalls Buffett. *"I remember the Continental Bank held over 5 percent of the company, and all of a sudden not only do they see that the trust accounts were going to have stock worth zero, but they could get assessed. The stock just poured out, of course, and the market got slightly inefficient for a short period of time."*

46. The Travelers Cheque was American Express's main product. The company introduced the card defensively when banks developed credit cards as a countermeasure to the Travelers Cheque.

47. Warren Buffett letter to Howard L. Clark, American Express Company, June 16, 1964. Brandt sent Buffett a foot-high stack of material, according to Jim Robinson, former CEO of American Express, who saw it. "I remember seeing Henry's stuff on American Express, just reams of it," said Bill Ruane in an interview.

48. At the end of it all, De Angelis pleaded guilty to four federal counts of fraud and conspiracy, and was sentenced to ten years in prison. "The Man Who Fooled Everybody," *Time,* June 4, 1965.

49. Howard Buffett, August 6, 1953, last will and testament.

50. Interviews with Patricia Dunn, Susie Buffett Jr., Warren Buffett.

51. In *Grand Old Party* (New York: Random House, 2003), Lewis L. Gould describes the way being a Republican became identified with racism in the minds of many people who changed parties during the civil-rights era.

52. Buffett cannot recall whether he initially registered as an independent or a Democrat. His preference would have been to register as an independent, but that would have precluded him from voting in primaries. Either immediately or within a few years, he did register as a Democrat.

53. Interview with Susie Buffett Jr.

54. Susan Goodwillie Stedman, recalling personal interview with Susan T. Buffett conducted November 2001, courtesy of Susan Goodwillie Stedman and Elizabeth Wheeler.

55. Dan Monen as quoted in Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York:

Doubleday, 1996. Monen is now deceased.

56. Warren's inability to deal with Howard's death is the incident most widely cited by family members as indicative of his inner state during this period.

Chapter 27

1. Warren Buffett letter to Howard L. Clark, American Express Company, June 16, 1964.

2. L. J. Davis, "Buffett Takes Stock," *New York Times,* April 1, 1990.

3. *"I'm not a hundred percent sure of that. I've been told that by other people, so it's hard to remember. But I'm pretty sure it was Howard Clark."*

4. In July 1964, Buffett's letter to partners said, "…our General category now includes three companies where B.P.L. is the largest single stockholder." Readers could infer from this a fairly concentrated portfolio.

5. Letter from Warren Buffett to partners, November 1, 1965.

6. Letter from Warren Buffett to partners, October 9, 1967.

7. Letter from Warren Buffett to partners, January 20, 1966.

8. The author studied Buffett's written work and interview material in reaching this conclusion. Charlie Munger, on the other hand, often uses the terms "dishonor" and "disgrace" (referring to others and not himself).

9. Interview with John Harding.

10. In 1962, according to an interview with Joyce Cowin.

11. Per capita. According to Everett Allen in *Children of the Light: The Rise and Fall of New Bedford Whaling and the Death of the Arctic Fleet* (Boston: Little, Brown, 1983), yearly income from whaling amounted to $12 million by 1854, making New Bedford probably the richest city per capita in the world before the Civil War.

12. More than thirty ships were lost in the disaster of 1871, most from New Bedford. The devastating cost of 1871 in financial and human terms laid waste to the industry. Whalers began building metal boats that could break through the ice in a futile quest to save what remained of the whaling industry.

13. Baleen is the "teeth" through which whales sieve plankton. The use of spring steel also reduced baleen demand.

14. Horatio Hathaway, *A New Bedford Merchant*. Boston: D. B. Updike, the Merrymount Press, 1930.

15. Partnership agreement, Hathaway Manufacturing Company, 1888. Among the other partners was William W. Crapo, a longtime New Bedford associate of Hetty Green's, who also invested $25,000. The total initial capital was $400,000.

16. With a fortune estimated at $100 million.

17. Eric Rauchway, *Murdering McKinley: The Making of Theodore Roosevelt's America.* New York: Hill and Wang, 2003.

18. The North was no workers' paradise, but in the South there were virtually no laws against child labor, excessive work hours, or unsafe work conditions. The mills owned the workers' houses and the stores where

they shopped, controlled their water supply, owned their churches, and effectively controlled the state governments and the courts. Machine-gun-bearing state militia prevented strikes. The workers were more like sharecroppers. Nearly ten thousand Northern workers had lost their jobs when the textile industry marched southward to the Carolinas in search of cheaper labor when air-conditioned plants were constructed after World War II.

19. Seabury Stanton, *Berkshire Hathaway Inc., A Saga of Courage*. New York: Newcomen Society of North America, 1962. Stanton made this address to the Newcomen Society in Boston on November 29, 1961.

20. Ibid.

21. In *A Saga of Courage,* Seabury says he conceived of the Stantons as forming part of an "unbroken thread of ownership" that stretched back to Oliver Chace, who had founded New England's textile industry and created Berkshire Fine Spinning's oldest predecessor company in 1806. Chace was a former apprentice of Samuel Slater, who first brought Sir Richard Arkwright's innovative spinning-frame technology to the United States at the end of the eighteenth century.

22. Hathaway Manufacturing Corporation Open House tour brochure, September 1953. Courtesy of Mary Stanton Plowden-Wardlaw.

23. If the goal had been to save jobs, the money to modernize need not have been spent. Roger Lowenstein, in *Buffett: The Making of an American Capitalist* (New York: Doubleday, 1996), quotes Ken Chace (now deceased) as saying that Seabury hadn't the slightest idea of return on investment.

24. Stanton (now deceased) is stated as having these opinions in "Berkshire Hathaway's Brave New World," by Jerome Campbell, *Modern Textiles,* December 1957.

25. Berkshire Hathaway 1994 chairman's letter.

26. Interviews with David S. Gottesman, Marshall Weinberg.

27. Letter to Warren Buffett on May 4, 1990, from James M. Clark Jr. at Tweedy, Browne Co., noting that "Howard Browne gave various accounts code initials."

28. Interview with Ed Anderson.

29. Interviews with Chris Browne, Ed Anderson.

30. According to Ed Anderson, this is how Buffett traded. The author is well acquainted with Buffetting in other contexts.

31. The commission sounds tiny, but at ten cents a share, Buffett later said, it was by far the highest commission he ever paid on a stock.

32. Interviews with Mary Stanton Plowden-Wardlaw, Verne McKenzie.

33. He also felt that Seabury's strategy of trying to bypass the New York "converters"—who turned the company's "gray goods" into finished dyed goods and sold them to customers—was a serious misjudgment.

34. "If you're in a business that can't take a long strike, you're basically playing a game of chicken with your labor unions because they're going to lose their jobs, too, if you close down…. And there's a lot of game theory involved. To some extent, the weaker you are, the better your bargaining position is—because if you're extremely weak, even a very short strike will put you out of business; and the people on the other side of the negotiating table understand that. On the other hand, if you have a fair amount of strength, they can push you harder. But it is no fun being in a business where you can't take a strike." Berkshire Hathaway's Warren Buffett and Charlie Munger, "The Incentives in Hedge Funds Are Awesome, But Don't Expect the

Returns to Be Too Swift," *Outstanding Investor Digest,* Vol. XVI, No. 4 & 5, Year End 2001 Edition.

35. Several of the Grahamites swear they saw the room. Buffett swears this story is not true. A former Plaza Hotel employee confirms that the seventeenth floor did have a few exceptionally small rooms, with bad views, and that it was possible to haggle the room prices down, especially later in the evening.

36. Interview with Ken Chace Jr.

37. According to Roger Lowenstein's *Buffett,* Ken Chace was the source. Warren does not recall any of the details, including talking to Jack Stanton, but he says Ken Chace's account is most likely correct.

38. Mary Stanton Plowden-Wardlaw, letter to Warren Buffett, June 3, 1991. Stanley Rubin set it up.

39. Interview with Mary Stanton Plowden-Wardlaw.

40. The detailed version of this story was related in Roger Lowenstein's *Buffett,* with Ken Chace as the source. Buffett recalls sitting on a bench near the Plaza with Chace, eating ice cream.

41. "The Junior League is an organization of women committed to promoting voluntarism, developing the potential of women and improving the community through the effective action and leadership of trained volunteers. Its purpose is exclusively educational and charitable," according to its mission statement. (The author is a member.)

42. He replaced the elderly Abram Berkowitz, who worked for the company's law firm, Ropes & Gray, and had cooperatively decided to step down.

43. Stanton said he "hastened [his] retirement due to a disagreement with regard to policy with certain outside interests which have purchased sufficient stock to control the company." "Seabury Stanton Resigns at Berkshire," *New Bedford Standard-Times,* May 10, 1965.

44. Berkshire Hathaway Board of Directors' minutes, May 10, 1965.

45. "Buffett Means Business," *Daily News Record,* May 20, 1965.

46. Adapted in part from the documentary *Vintage Buffett: Warren Buffett Shares His Wealth* (June 2004) and in part from interviews.

Chapter 28

1. Interview with Doris Buffett.

2. Ibid.

3. November 10, 1965.

4. *Report of the National Advisory Commission on Civil Disorders.* New York: Bantam Books, 1968.

5. "Riot Duty Troops Gather in Omaha," *New York Times,* July 5, 1966. The governor said the problem was unemployment, which ran triple that of whites. 30% of blacks were unemployed in Omaha.

6. Bertrand Russell, *Has Man a Future?* New York: Simon & Schuster, 1962. This powerful, absolutist book argued that unless something "radical" happened, mankind was eventually doomed by weapons of mass destruction, and predicted the development of mass chemical and biological weapons in the not-distant future.

7. The 1955 Russell-Einstein Manifesto. Russell was president of the Campaign for Nuclear Disarmament in

1958, and was cofounder with Einstein of the Pugwash Conference, a group of scientists concerned about nuclear proliferation.

8. Interview with Dick Holland.

9. Buffett and his chief administrative officer John Harding chose a set of representative large-cap stocks, in effect creating a market index. Buffett did not want to execute the trade through a brokerage firm because the broker kept the proceeds from the sale and paid no interest to him. Harding contacted university endowment funds. Buffett went personally to Chicago to get shares. The idea of lending directly to a short-seller was so novel at the time that most universities passed. However, Harding was able to borrow about $4.6 million of stock.

10. Buffett put $500,000 into treasury bills in the first quarter of 1966.

11. Interview with Susie Buffett Jr., Meg Mueller, Mayrean McDonough.

12. Interview with Kelsey Flower.

13. Interview with Susie Buffett Jr.

14. Interview with Marshall Weinberg.

Chapter 29

1. "The Raggedy Man," by James Whitcomb Riley, a children's poem about a handyman.

2. Interview with Chuck Peterson.

3. Buffett tells the story, which Charlie Heider recalls and found unforgettable. Parsow doesn't recall it.

4. Both Byer-Rolnick and Oxxford were acquired by Koret in 1967.

5. Interview with Sol Parsow.

6. Gottesman worked for Corvine and Company, which, he says, was going out of business. He founded his own firm, First Manhattan Co., in 1964.

7. Interview with Sandy Gottesman.

8. "That's not negotiating," claims Munger. "It's just using pithy examples to steer people to what they should be doing. Sure, it's persuasion, but it's legitimate persuasion."

9. The Kohns were planning to sell for a quarter less than the tangible net assets of the business. Gottesman had done a private placement of debentures for Hochschild-Kohn with Equitable Life that year and was familiar with its financial statements. His mother-in-law, her brother Martin Kohn, and another sister were equal stockholders who owned a class of preferred stock in the company. The preferred stock was in arrears, not having paid a dividend in some time. In effect, therefore, they could have controlled the business. They had not exercised this privilege, however. The common stock was owned largely by their relative Louis Kohn, from another branch of the family and second in command after Martin Kohn.

10. DRC Offering documents for 8% debentures, December 18, 1967.

11. He gave them the money anyway, partnered with National City to provide $9 million in short-term financing for the deal. Diversified Retailing Company, Inc., Prospectus, December 18, 1967. According to Gottesman and *Moody's Bank & Finance Manual,* Martin Kohn was on the board of Maryland National Bank.

12. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HQ-784. Thursday, March 20, 1975, page 187.

13. Buffett mentioned the problem to the partners in his mid-1966 letter but stressed the more important question of buying a *company* rather than a *stock.* Another factor was the banks, which had also started issuing credit cards, cutting further into Hochschild-Kohn's edge.

14. Interview with Charlie Munger. The company was purchased in April 1967.

15. Diversified Retailing Company, Inc., Prospectus, December 18, 1967.

16. Buffett says Rosner told him he got Aye Simon's consent to sell the business by saying something along the following lines: "And to hell with you. If you're going to second-guess it, you come down and run the store." The relationship was irretrievably broken.

Chapter 30

1. Including Buffett's stock in Data Documents, a separate investment, the Buffetts' net worth was somewhere between $9.5 and $10 million.

2. Buffett's description, in Patricia E. Bauer's "The Convictions of a Long-Distance Investor," *Channels,* November 1986, was, "One time we had a dog on the roof, and my son called to him and he jumped. It was so awful—the dog that loves you so much that he jumps off the roof…"—leaving the reader to wonder how the dog got on the roof.

3. Interview with Hallie Smith.

4. "Haight-Ashbury: The Birth of Hip," CBC Television, March 24, 1968.

5. In 1967, over 2.5 billion shares traded, topping the previous 1966 record by one third. Thomas Mullaney, "Week in Finance: Washington Bullish," *New York Times,* December 31, 1967.

6. But insurers looked undervalued and he thought they would get taken over. He bought Home Insurance and Employers Group Associates.

7. Sun Valley Conference, 2001.

8. At high rates of return, and paying no tax. If a shareholder had taken $0.06 a share—after paying a tax on the $0.10 dividend—and put it in the market earning 5% on average, he would have about $0.42. If Buffett had kept that $0.10, and compounded it at the 21% he earned over the past forty years, a shareholder, who would have been slightly diluted over the years, would be $135 richer. Looking at it on a larger scale, the tiny dividend "cost" Berkshire shareholders over $200 million as of 2007.

9. Interview with Verne McKenzie.

10. Letter to partners, July 12, 1967.

11. Interview with Verne McKenzie.

12. "Requiem for an Industry: Industry Comes Full Circle," *Providence Sunday Journal,* March 3, 1968.

13. Letter to partners, January 25, 1967.

14. By September 30, 1967, the partnership had $14.2 million in treasuries and short-term debt out of a total $83.7 million invested.

15. Alice was a friend of Ringwalt's; the family believed she may have once had some sort of "understanding" that might have led to marriage until Ernest put a stop to it. Ringwalt had a reputation as a ladies' man, but Alice also kept house for her father, and *"no one was good enough for her,"* Buffett says.

16. Interview with Bill Scott.

17. Interview with Charlie Heider.

18. Robert Dorr, "'Unusual Risk' Ringwalt Specialty," *Omaha World-Herald,* March 12, 1967, and Ringwalt's *Tales of National Indemnity and Its Founder* (Omaha: National Indemnity Co., 1990) recount stories of lion tamers, circus performers, and hole-in-one contests. Buffett heard of the burlesque stars from Ringwalt.

19. Berkshire paid Heider a $140,000 fee for the transaction.

20. Interview with Bill Scott.

21. With the company closely held, it took only a week to round up the necessary 80% shareholder approvals.

22. In his book, Ringwalt says he was only driving around looking for a metered place on the street because he refused to pay a parking garage.

23. This was a reason why National Indemnity would not need reinsurance, or protection from other insurers, which was both expensive and would make it a dependent.

24. Ringwalt also was included in the shareholder register of Diversified Retailing in 1976 (he actually sold 3,032 shares back to the company in its tender offer).

Chapter 31

1. As quoted in an interview with Jose Yglesias as Dr. King prepared for the Poor People's Campaign. Jose Yglesias, "Dr. King's March on Washington, Part II," *New York Times,* March 31, 1968.

2. Wead, who declined to be interviewed, was the director of Wesley House, a community improvement organization of the Methodist Church.

3. Interview with Racquel Newman and her son, Tom Newman. A number of other people recalled Susie and Rackie's activities.

4. Interview with Chuck Peterson.

5. Buffett had met Rosenfield through a connection to Hochschild-Kohn.

6. Grinnell's founder, Congregational minister Josiah Grinnell, pastor of the First Congregational church in Washington, D.C., bolted from its doors in 1852 when his Southern congregation took exception to his abolitionist views. It was Grinnell who sought advice from the famous *New York Herald* editor Horace Greeley and who heard the words that every schoolchild in America would subsequently learn without knowing their source: "Go West, young man, go West!" The phrase was originally written by John Soule in the *Terre Haute Express* in 1851.

7. Interview with Waldo "Wally" Walker, Dean of Administration at the time.

8. The luckless George Champion, chairman of the board of Chase Manhattan Bank, followed King on the program, speaking on "Our Obsolete Welfare State."

9. This common paraphrase of Lowell was more eloquent than Lowell's actual words: "Though her portion be the scaffold, And upon the throne be wrong." James Russell Lowell (1819–1891), "The Present Crisis," 1844.

10. Interview with Hallie Smith.

11. From King's 1963 speech at Western Michigan University. King may have said something like this at the October 1967 Grinnell Convocation, but no transcript exists.

12. King first said this in Cleveland in 1963 and used variations of it in most major speeches thereafter. He called the idea that you can't legislate morality a "half-truth." "It may be true that the law cannot make a man love me," he said, "but it can keep him from lynching me, and I think that is pretty important."

13. Despite flirting briefly with the magic 1,000, it had ended down more than 15%.

14. Letter to partners, January 25, 1967.

15. Letter to partners, January 24, 1968.

16. Galbraith in an interview by Israel Shenker, "Galbraith: '29 Repeats Itself Today," published in the *New York Times* on May 3, 1970. "The explosion in the mutual funds is the counterpart of the old investment trusts. The public has shown extraordinary willingness to believe there are financial geniuses in the hundreds. Financial genius is a rising stock market. Financial chicanery is a falling stock market." Galbraith reiterates this in "The Commitment to Innocent Fraud," *Challenge,* Sept.–Oct. 1999: "In the world of finance, genius is a rising market."

17. Grinnell forgave Noyce after intervention from his physics professor Grant Gale and, according to Buffett, from Rosenfield.

18. Wallace sought signatures in order to be placed on the Nebraska ballot as a candidate for the American Party.

19. Wallace hired an ex-Klansman as a speechwriter and made a number of inflammatory statements at different times, such as "I reject President Kennedy's statement [that] the people of Birmingham have inflicted abuses on the Negroes…the President wants us to surrender this state to Martin Luther King and his group of Communists." Yet his famous stand, blocking the University of Alabama's Foster Auditorium to prevent the enrollment of two black students until forced by federal marshals and the National Guard to step aside, was a compromise apparently engineered with the White House to appease white supremacists and avoid violence while allowing the blacks to enroll. Wallace later apologized to the black community for his role.

20. Associated Press, "Disorder, Shooting Trail Wallace Visit," *Hartford Courant,* March 6, 1968; Homer Bigart, "Omaha Negro Leader Asks U.S. Inquiry," *New York Times,* March 7, 1968.

21. "Race Violence Flares in Omaha After Negro Teen-Ager Is Slain," *New York Times,* March 6, 1968; Bigart, "Omaha Negro Leader Asks U.S. Inquiry."

22. Associated Press, "Disorder, Shooting Trail Wallace Visit."

23. UPI, "1 Wounded, 16 Held in Omaha Strike," July 8, 1968.

24. He recovered after a lengthy hospital stay. Part of this account is from *The Gate City: A History of Omaha* (Lincoln: The University of Nebraska Press, 1997).

25. In a December 1981 *Playboy* interview, Henry Fonda, an Omaha native, recounts witnessing the same

event: “It was an experience I will never forget…. My dad’s office looked down on the courthouse square and we went up and watched from the window…. It was so horrifying. When it was all over, we went home. My dad never talked about it, never lectured. He just knew the impression it would have on me.”

26. April 4, 1968.

27. Interview with Racquel Newman.

28. The club was renamed Ironwood in 1999.

29. By coincidence, at the time, Chuck Peterson had also been put up for the Highland. Peterson was eating there a lot with fellow flying enthusiast Bob Levine and thought he ought to join instead of freeloading.

30. Stan Lipsey, another friend of Buffett’s, weighed in on behalf of Chuck Peterson. “I got so high-profile because of that,” says Lipsey, “that they made me serve on the board next year. No good deed goes unpunished. A golf buddy named Buck Friedman was the chairman. He was very serious, and I’d be trying to crack them up. He didn’t like that I’d call him Buckets.”

Chapter 32

1. Warren Buffett letter to Ben Graham, January 16, 1968.

2. Ibid.

3. Armon Flenn, “Run for Your Money,” *New York Times,* June 3, 1968; “Mutual Interest,” *Time,* January 19, 1968; Robert D. Hershey Jr., “Mutual Funds Reaching Further for Investment,” *New York Times,* September 29, 1968.

4. In 1929, only about 3% of the population owned stock. In 1968, about 12.5% of the population owned stock or equity mutual funds.

5. Letter to partners, July 11, 1968.

6. The SEC prepared a study stating that the new system, NASDAQ, was “on the horizon” in 1963. NASDAQ went live on February 8, 1971, and traded as much volume as the American Stock Exchange in its first year. Eric J. Weiner, *What Goes Up: The Uncensored History of Modern Wall Street,* New York: Little, Brown, 2005.

7. Warren Buffett letter to the Graham Group, January 16, 1968.

8. Warren Buffett letter to the Graham Group, September 21, 1971.

9. DRC earnings were down overall $400,000, or 17%, in 1968. Associated Cotton Shops earned about 20% on the money employed in the business—an outstanding performance in any year but especially in difficult 1968.

10. Letter to partners, January 24, 1968.

11. Buffett lost money in stocks at times and was quick to cut his losses. The margin of safety didn’t prevent losses but shifted the odds away from large losses.

12. The Youth International Party (Yippees), a prankster group of anarchist activists, nominated Pigasus the Pig as their party candidate. Leader Jerry Rubin said, “Why vote for half-pigs like Nixon, Wallace, and Humphrey, when you can have the whole hog?” at a speech to the University of British Columbia Faculty Club (October 24, 1968).

13. Interview with Verne McKenzie, who says that Chace was upset but did not show it. He did what he had to do.

14. The impact of credit cards and a radical change in consumer thinking about consumption is hard to overstate. Savings and layaway—once commonplace in purchasing even items such as clothing—were replaced by debt. Although economists debate measures of household wealth over time, the result has been a world of renters who tithe to financial institutions. The "earthquake risk" is a catastrophic mass deleveraging. (See 2008 credit crisis.)

15. Retailers paid, on average, 2¢ for every dollar of sales for the stamps they gave out and tacked this onto the price of their goods.

16. They priced Blue Chip cheaper, at 1.5¢.

17. Blue Chip had 71% of the trading-stamp business in California at the time. "Safe on Its Own Turf," *Forbes,* July 15, 1968.

18. Sperry & Hutchinson sued Blue Chip when the Alpha Beta and Arden-Mayfair food chains dropped S&H stamps in favor of Blue Chip stamps. Blue Chip paid $6 million to settle this case.

19. Each "package," priced at $101, consisted of $100 face amount of 6.5% ten-year debt plus three shares of $0.333 par common stock. A total of 621,600 Blue Chip shares were included in the offering. Nine retailers who were big Blue Chip customers split another 45%, which went into trusts for ten years. The remaining 10% went to company management (as reported in the *Wall Street Journal,* September 23, 1968).

20. A couple of gas-station chains were still suing, as were a group of small trading-stamp companies in Northern California. Blue Chip Stamps annual report to shareholders, 1969.

21. One of the Graham Group members recalls this.

22. Letter to partners, January 24, 1968.

23. Leslie Berlin, *The Man Behind the Microchip.* New York: Oxford University Press, 2005.

24. Buffett shorted 10,000 shares of Control Data in the third quarter of 1965 in the low $30s—at this point he had over $7 million of his portfolio in shorts. He eventually bought some Control Data for the partnership in 1968, as a "workout," meaning an arbitrage.

25. Interview with Katie Buffett, who said Fred wanted to put in $300 and she "snitched a little" to add another hundred. She thought she would have been better off putting more money in the partnership.

26. In the form of a convertible debenture.

27. Leslie Berlin, *The Man Behind the Microchip.*

28. Buffett told his partners about the "particularly outstanding performances" of Associated Cotton Shops and National Indemnity Company. But the controlled companies had only a "decent" performance overall; Berkshire and Hochschild-Kohn were dragging down the results.

Chapter 33

1. A former Kelly girl temporary office worker, Kaiser came to work in January 1967 and stayed until her retirement in 1993.

2. Interview with Donna Walters. Buffett shared Walters with Sol Parsow, the men's haberdasher in the building's lobby.

3. Blue Chip stamps were the closest equivalent.

4. Beginning with "Love Only Thing That Stops Guard," *Omaha World-Herald,* April 20, 1952, continuing to a cute feature picture of Susie and the kids packing a picnic Thermos, and a story about him buying Sam Reynolds's house.

5. Loomis's recollections are from her memoir in *Fortune,* "My 51 Years (and Counting) at *Fortune,*" *Fortune,* September 19, 2005.

6. Loomis wrote an admiring profile of hedge-fund manager A. W. Jones, "The Jones Nobody Keeps Up With," *Fortune,* April 1966, around the time or shortly before she met Buffett. In this article she mentions Buffett in passing. She did not begin to profile him in her writing until "Hard Times Come to the Hedge Funds," *Fortune,* January 1970.

7. Buffett says that he never actually overslept his paper route. This seems to be his version of the common "test-anxiety dream."

8. Interview with Geoffrey Cowan.

9. Interview with Tom Murphy.

10. Warren Buffett letter to Jay Rockefeller, October 3, 1969. Buffett added, *"It tends to be a very poor business unless you have a life-size fold-out of a girl in the middle. I have frequently told my partners that I would rather lose money logically than make money for the wrong reasons. Hopefully, I will come up with some similar aphorism to rationalize this deal."*

11. Buffett put in $32,000 to start.

12. Interview with Charles Peters, with additional condensed comments adapted from Peters's memoir, *Tilting at Windmills.* New York: Addison-Wesley, 1988.

13. Buffett put in another $50,000.

14. After being told that he couldn't donate his investment in the *Washington Monthly* to charity, "I finally let them give the stock to one of the people who worked there, just to get rid of it," says Stanback. "It was worthless."

15. Letter to partners, May 29, 1969.

16. Ibid.

17. Ibid.

18. The Buffetts hired teachers as babysitters, but Howie co-opted the teachers' husbands into becoming his confederates, doubling the degree of lawlessness.

19. Al Pagel, "Susie Sings for More Than Her Supper," *Omaha World-Herald,* April 17, 1977.

20. Interview with Milton Brown.

21. Berkshire Hathaway annual meeting, 2004.

22. Letter to partners, October 9, 1969.

23. John Brooks, *The Go-Go Years.* New York: Ballantine Books, 1973.

24. The stock had "split" so that each share became five, then promptly rose to $25 per share.

25. Blue Chip had called a shareholders' meeting to vote on a secondary offering in which shareholders could offer blocks of existing stock to the public.

26. Interview with Wyndham Robertson, who says she could barely understand the code when she first joined the Graham Group two years later in Carmel.

27. Letter to Graham Group, September 21, 1971.

28. Interviews with Marshall Weinberg, Tom Knapp, Fred Stanback, Ruth Scott.

29. Interview with Ed Anderson.

30. Letter from Warren Buffett to Graham Group, September 21, 1971.

31. Interview with Fred Stanback.

32. Interview with Sandy Gottesman, who notes that they basically broke even on the deal; he says that a bit of mythology has arisen around the Hochschild-Kohn deal. "It goes down in history as an enormous mistake," he says. "And I don't think it was as big a mistake as represented…it's grown way out of proportion."

33. Supermarkets General bought Hochschild-Kohn in 1969 for $5.05 million cash plus $6.54 million in non-interest-bearing notes with a present value of about $6 million. Effectively, DRC received about $11 million.

34. From the 1969 Diversified Retailing annual report. But if Buffett had been hit by the proverbial bus, under the terms of the debenture, the obligation for mandatory redemption would have ceased. So he was taking the element of random chance out of it.

35. Wilder was not the only doubter. *"Danny [Cowin] thought I was crazy to do it,"* says Buffett.

36. Cited in the 1989 letter to shareholders.

37. "How Omaha Beats Wall Street," *Forbes,* November 1, 1969.

38. The article stated that Buffett had lived in the house since his marriage in 1952, an error later repeated by other writers. The Farnam house was far from the "starter home" that is implied. Articles often refer to the house as "modest" or some similar term and rarely mention its extensive remodeling. Buffett bought the house in 1958.

39. Evelyn Simpson, "Looking Back: Swivel Neck Needed for Focus Change Today," *Omaha World-Herald,* October 5, 1969.

Chapter 34

1. Carol Loomis, "Hard Times Come to the Hedge Funds," *Fortune,* January 1970, the first of a series of Loomis articles that showcase Buffett's opinions.

2. Book value. Tangible book value was $43. Warren Buffett letter to partners, October 9, 1969.

3. Ibid.

4. The more inquisitive partners may have discovered that Berkshire Hathaway owned *Sun* Newspapers by

reading its 1968 annual report.

5. Letter to partners, October 9, 1969. Buffett explained that he expected stocks to yield about $6^1/2\%$ after tax for the next ten years, roughly the same as a "purely passive investment in tax-free bonds." Even the best managers, he said, were unlikely to do better than $9^1/2\%$ after tax. Compare this to the 17% return he had projected to partners in the early years of the partnership and the 30% average he had actually achieved.

6. Letter to partners, December 5, 1969.

7. According to Buffett, a couple of them never were able to find anyone they trusted to manage their money, and one ended up working as a fortune-teller in San Diego.

8. Letter to partners, December 26, 1969.

9. This statement is intriguing since Buffett had just named Dow Jones as the stock he would like to own on a desert island. However, the *Sun* was not a good investment.

10. Emphasis added by author. By then, a small cult of Buffett-stalkers monitored his holdings, and curiosity about Buffett's intentions was rife among many partners. The importance of a clear statement of his intentions—after more than a decade of obsessive secrecy—should have been unmistakable (at least with hindsight).

11. Buffett indulged in a bit of score-settling with the underwriters in his letter to partners of December 26, 1969, saying that the deal was pitched "with a heavy weight" placed on a comparison to Sperry & Hutchinson, the nearest competitor, but shortly "before the stock was to be offered, with the Dow Jones Industrials much lower but S&H virtually unchanged, they indicated a price far below their former range." (Blue Chip at the time had declined significantly.) "We reluctantly agreed and felt we had a deal but, on the next business day, they stated that our agreed price was not feasible."

12. It was a little unclear what the filling stations' actual beef was. They had given out Blue Chip stamps and made money doing it. If there were five stamp companies in California, they might have given out stamps that cost more, and it isn't clear that they would have made more money—they might have made less.

13. This takes into account the approximately 90,000 shares of Blue Chip Stamps that were still tied up in BPL because of the delay in the sale.

14. DRC's 1971 annual report discloses $841,042 of notes issued "in exchange for common stock of an affiliated company" due on varying dates, or within twelve months of the death of Warren E. Buffett. DRC continued to issue these notes until 1978, for a total of $1.527 million. During the first year the notes were also payable at the payee's demand. Apparently the notes were reissued with this term eliminated in 1972 (according to the 1972 DRC financial statements).

15. 1970 Annual Statement for Reinsurance Corporation of Nebraska, Berkshire Hathaway, Diversified, and Blue Chip, Forms 10-K and annual reports to shareholders.

16. Interview with Verne McKenzie.

17. Interview with Rhoda and Bernie Sarnat.

18. Interview with Charlie Munger.

19. Through chunks of stock large enough to almost certainly block an unfriendly takeover.

20. Blue Chip sales peaked in 1970 at $132 million.

21. A&P's discounting program, Where Economy Originates, prompted other supermarket chains to adopt

discounting in 1972. "The Green Stamp Sings the Blues," *Forbes,* September 1, 1973.

22. From the files of Berkshire Hathaway.

23. Interview with Bill Ramsey. The sale occurred because Laurence A. See, son of Mary See and a founder of the firm, had died, and Charles See, his brother and executor of his estate, mentioned to an attorney acquaintance while on vacation in Hawaii that he might want to sell. The attorney told Bob Flaherty, who worked for Scudder, Stevens, and Clark, and Flaherty talked to Ramsey, who was also a client of the firm.

24. From Margaret Moos Pick, *See's Famous Old Time Candies, A Sweet Story.* San Francisco: Chronicle Books, 2005.

25. Interview with Ed Anderson.

26. Buffett and Munger paid 11.4x trailing twelve months earnings for See's (i.e., a price equal to over eleven years' worth of the company's earnings—at the past twelve months' earnings rate). This was a remarkably high price/earnings ratio for Buffett, who rarely paid more than ten times earnings. Paying more than book value was also unprecedented. Susie told at least one friend that he "bought it for her," because of her chocolate obsession, which sounds like something he might have said as an endearment.

27. Since 1960.

28. Letter from John W. Watling to Harry W. Moore, December 3, 1971. Buffett was particularly involved in tax aspects of the deal. He wrote a detailed memorandum outlining a proposed structure for the company's trademarks in order to obtain a tax basis equal to the effective purchase price without incurring the tax costs that a sale would entail under tax law at the time, such as depreciation recapture and investment tax-credit recapture. Price Waterhouse, the accountants for See's, apparently were pleased that Buffett had done their job and wrote a memo concurring with his proposal and explaining how it would be executed (letter from Price Waterhouse & Co. to William F. Ramsey, January 18, 1972).

29. This account is an amalgamation of interviews with Munger and remarks at the Berkshire Hathaway 2003 annual meeting. Warren Buffett and Charlie Munger, "What Makes the Investment Game Great Is You Don't Have to Be Right on *Everything,*" *Outstanding Investor Digest,* Vol. XVIII, Nos. 3 and 4, Year End 2003 Edition.

30. Interviews with Ed Anderson and Chris Browne. Buffett's reasoning in situations like this and Berkshire was that he needed the stock to get control. However, his allies could have kept their stock and voted with him. Indeed, in his younger days when he had less capital, Buffett had arranged such voting blocks.

31. Warren Buffett letter to Chuck Huggins, December 28, 1971.

32. During the early 1970s, the price of sugar increased sixfold. Although most news stories focused on the price of meat, sugar and cocoa were the commodities that experienced the most wrenching price increases.

33. At the time a cult product that people carried home on airplanes after encounters on vacation in Colorado.

34. Narrative is based on correspondence among Warren Buffett, Stanley Krum, and Chuck Huggins, 1972. In a letter dated later in 1972, Buffett the teetotaler also says, "Maybe grapes from one little eighty-acre vineyard in France are really the best in the whole world, but I have always had a suspicion that about 99% of it is in the telling and about 1% is in the drinking."

35. This is the lament of a number of the managers.

36. Warren Buffett letter to Chuck Huggins, September 25, 1972.

37. Interviews with Tom Newman, Raquel Newman.

38. Buffett also would have gone on the board of his favorite company, GEICO, had the SEC not concluded that it would be a conflict because Berkshire Hathaway already owned an insurance company, National Indemnity.

39. Interview with Peter Buffett.

40. Each of the advisory-board members invested about $7,000. Control of the bank was retained within the African-American community. Some blacks did not want white investors. *"They just thought we were trying to put something over on them, I guess,"* Buffett says.

41. Interview with John Harding.

42. Interview with Larry Myers. According to Myers, Buffett continued this level of involvement for seventeen years. An advisory board is different from a regular board position and normally requires less time commitment.

43. Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996.

44. Interview with Hallie Smith.

45. Interview with Rhoda and Bernie Sarnat. Buffett recalls the story as well.

46. At an anniversary party for the Thompsons a few weeks earlier, the Buffetts' cook served what came to be known throughout Omaha as the "poisoned chicken." Except for a rabbi and his wife, who ate tuna, everyone present came down with salmonella. By then, Buffett was so well-known that the episode made the *Omaha World-Herald.* Interview with Rabbi Meyer Kripke.

47. Interview with Ron Parks.

48. As Buffett tells this story he lost the game, but according to Roxanne and Jon Brandt, he was determined not to lose to a six-year-old—and won.

49. According to a friend, Susie began to verbalize this attitude around the late 1960s. She later said these words, as quoted, to Charlie Rose in an interview.

50. Interview with Milton Brown. Several sources confirm that Susie was frequently in contact with Brown during this period.

51. Interviews with Racquel Newman, Tom Newman.

52. His mortgage was $109,000 in 1973.

Chapter 35

1. "Warming Up for the Big Time: Can John Tunney Make It as a Heavyweight?" Charles T. Powers, *West* magazine *(Los Angeles Times),* December 12, 1971.

2. A letter from Senator Ed Muskie to Buffett, September 23, 1971, said that Muskie was "especially intrigued by this concept," which Hughes and Rosenfield had passed along to him. Later, the same notion, with the more memorable and attention-grabbing name "misery index," played a role in President Jimmy Carter's failure to win a second term.

3. James Doyle, "A Secret Meeting: Hughes Rejects Presidential Bid," *Washington Evening Star,* July 15, 1971.

4. John H. Averill, "Hughes Drops Out as Democratic Contender," *Los Angeles Times,* July 16, 1971.

5. Without naming the interviewer, this incident is cited by James Risser in "'Personal' Religion of Senator Hughes," *Des Moines Sunday Register,* July 11, 1971. Hughes appeared on *Meet the Press* on April 4, 1971.

6. James Risser and George Anthan, "'Personal' Religion of Senator Hughes." Hughes said he "believes in the ability of certain people to foretell the future."

7. The way Hughes told this story (with Dick Schneider) in his autobiography, *The Man from Ida Grove* (Lincoln, Va.: Chosen Books, 1979), differed slightly from the press account. Hughes freely discusses his reputation as a "mystic" and mentions Rosenfield's backing. He does not mention Buffett but recalls the meeting as taking place in a California motel room instead of Washington, as reported. On the plane on the way home, he saw "a vision of a red button" that would launch "an awesome nuclear attack" and says he realized that, as President, he could not press the button. After asking God's guidance, he decided not to run for President.

8. John H. Averill, "Hughes Drops Out as Democratic Contender." Most likely, the media would have unearthed the story at some point anyway, and Hughes was saved from greater embarrassment later. Hughes's advisers subsequently denied in the *Los Angeles Times* that disclosing his beliefs in spiritualism and his communication with his dead brother through a medium had influenced his decision not to run.

9. Interview with Tom Murphy.

10. This version of the story is an amalgamation of Murphy's and Buffett's versions. The stories are identical except for trivial differences in their recollection of the dialogue.

11. The announcement of the sale of the *Fort Worth Star-Telegram* and the area's AM and FM radio stations to Cap Cities for $80 million was on January 6, 1973. However, the closing of the deal was delayed until November 1974.

12. *"I should have done it,"* Buffett says. *"That was really dumb. We would have made a lot of money with that."*

13. According to Boys Town (now renamed Girls and Boys Town), the home opened on December 12, 1917, with about six boys and grew to twenty-five within three weeks. The approximate date and number ("between twenty and thirty") are cited in *Omaha's Own Magazine and Trade Review,* December 1928.

14. Howard Buffett "helped us greatly in securing our own post office for which we were deeply grateful, because he came to us to assist us when we were badly in need of a friend." Patrick J. Norton letter to Warren Buffett, April 24, 1972. The post office was established in 1934 and the village became incorporated in 1936, according to the *Irish Independent,* August 25, 1971. The post office was a key element in the charm of Boys Town's fund-raising appeals.

15. The average contribution at the time of the *Sun*'s story was $1.62. Transcript, Mick Rood interview with Msgr. Nicholas Wegner.

16. Ibid. Robert Dorr, "Hard-Core Delinquent Rarity at Boys Town," *Omaha World-Herald,* April 16, 1972.

17. Paul Williams, *Investigative Reporting and Editing,* Englewood Cliffs, N.J.: Prentice-Hall, 1978. Williams was the editor during the Boys Town investigation.

18. Michael Casey, new director of special projects brought in after the *Sun* story, described the atmosphere as a "minimum-security prison," based on his experience working in prisons and mental hospitals, in "Midlands News" of the *Omaha World-Herald,* March 10, 1974. According to Casey's account, he was forced to resign from Boys Town six months later and stated that reforms were window dressing. Father

Hupp says Casey left because his job was done—but Casey was an outspoken ex-convict, which may have made him "too hot."

19. Paul N. Williams, "Boys Town, An Exposé Without Bad Guys," *Columbia Journalism Review,* January/February 1975.

20. The *Sun* had a "four-way" staff that reported stories that would appear in seven editions of the paper. These were the reporters working on the Boys Town story.

21. According to Paul Williams, in *Investigative Reporting and Editing,* Boys Town got school-aid funds and state welfare and gasoline tax funds. While these were "relatively small change" in the context of the overall budget, about $200,000 a year, the discrepancy was real and pointed to other possible problems.

22. Transcript, Mick Rood interview with Msgr. Nicholas Wegner. Wegner speaks of "this gal down there in the Lincoln welfare department [who] tried to make a big thing, a big blow out of this…" which, he thought, was personal rather than institutional. Nevertheless, he implied that Boys Town might move out of state if the regulators pestered it too much because "our bylaws say WE'RE NOT OBLIGED TO STAY HERE."

23. Paul Williams, *Investigative Reporting and Editing.*

24. Interview with Mick Rood. According to several sources, the "Deep Throat" of Boys Town, a role that required courage in insular Omaha, was Dr. Claude Organ.

25. Jeannie Lipsey Rosenblum described his appearance at that time in an interview.

26. As a religiously affiliated organization, Boys Town was entitled to an exemption for the first two years and could have filed with the archdiocese of Omaha. But it had filed separately anyway.

27. According to Paul Williams, the footwork in Philadelphia was done by Melinda Upp, a Washington reporter whom he previously had tried to hire. Finally, the call came: Are you sure you want this? she asked. The IRS charged a dollar a page and it was 94 pages long. The answer was, Hell, yes.

28. Interview with Randy Brown.

29. In his follow-up columns in the *Sun*.

30. The $25 million is combined fund-raising and investment income.

31. Interviews with Mick Rood, Warren Buffett.

32. The *Sun* published on Thursdays and worked around its own production schedule while trying to cut off the opportunity for a preemptive response through the *Omaha World-Herald.*

33. Paul Williams, *Investigative Reporting and Editing,* and Craig Tomkinson, "The Weekly Editor: Boys Town Finances Revealed," *Editor & Publisher,* April 15, 1972.

34. Transcript, Mick Rood interview with Msgr. Nicholas Wegner.

35. The reporters interviewed thirteen of the seventeen board members. Two were too old or ill to be interviewed.

36. Monsignor Schmitt, speaking at a press conference on May 22, 1972. Press conference transcript.

37. Interview with Randy Brown.

38. Paul N. Williams, "Boys Town, An Exposé Without Bad Guys."

39. Michael D. LaMontia, director of the State Department of Public Institutions, which oversaw Boys Town, called the *Sun*'s criticisms those of a "vocal minority" that should be ignored in a letter to Wegner, May 25, 1972. The *Sun,* he said, speaks "from a very low profile and is really not heard by many people. The person being attacked can let it die a natural death…." He referred to the reporters as "scavengers" and "professional losers." Possibly Mr. LaMontia was merely being empathetic, but his tone seemed a little more charged-up than that.

40. Paul N. Williams, "Boys Town, An Exposé Without Bad Guys."

41. "Boys Town Bonanza," *Time,* April 10, 1972; "Boys Town's Worth Put at $209 Million," *Los Angeles Times,* March 31, 1972; "Money Machine," *Newsweek,* April 10, 1972; Tomkinson, "The Weekly Editor."

42. "Other Boys Homes Affected by Boys Town Story," *Omaha Sun,* December 14, 1972.

43. Undated two-page letter from Francis P. Schmitt to Boys Town supporters printed on Boys Town stationery; "Boys Town May Take Legal Steps to Initiate New Programs, Policies," *Omaha Sun,* December 14, 1972; correspondence between Paul Williams and the "Irreverent Reverend" Lester Kinsolving of the National Newspaper Syndicate Inc. of America, a muckraking religious columnist widely syndicated through the *San Francisco Chronicle.* Schmitt was angry because, among other things, Boys Town's marketing domicile had backfired: Kinsolving wrote a follow-up story in the *Washington Evening Star,* "Boys Town Money Machine" (November 4, 1972), and datelined it Boys Town, Nebraska. Schmitt (incorrectly) felt that he had no right to do so.

44. Paul Critchlow, "Boys Town Money Isn't Buying Happiness," *Philadelphia Inquirer,* July 20, 1973.

45. The Reverend Monsignor Wegner, letter to a man who said he was an employee of the *San Francisco Examiner* and worked in the composing room, June 1, 1973. The man wrote Lester Kinsolving at the *San Francisco Chronicle* and asked that his name not be used in a story, probably because he was offering it to a competing paper. Kinsolving apparently forwarded this material to Buffett.

46. Used with permission of the Omaha Press Club Foundation.

47. Warren Buffett letter to Edward Morrow, April 21, 1972.

48. Memo from Paul Williams to Buffett, October 13, 1972, including Buffett's comments.

49. Mick Rood note to personal files, January 19, 1973. Transcript, Mick Rood interview with Msgr. Nicholas Wegner.

50. The award was to "The Sun Newspapers of Omaha, of *The Sun Newspapers of Omaha:* For uncovering the large financial resources of Boys Town, Nebraska, leading to reforms in this charitable organization's solicitation and use of funds contributed by the public." It was the first time a weekly paper won for Local Investigative Specialized Reporting (although according to Pulitzer Center staff, weeklies had won before in categories other than investigative reporting).

51. However, Monsignor Wegner was described as "frail" and had had several recent surgeries. See Paul Critchlow, "Boys Town Money Isn't Buying Happiness."

52. Among the consultants' findings was that the Boys Town staff morale was now low, with many long-tenured employees having worked for years on church-mouse wages on the impression that Boys Town was barely getting by. In 1973, Boys Town actually raised more money than in 1972 (over $6 million), according to the *Omaha World-Herald* (March 21, 1973). The main result of the exposé and reforms was increased transparency and accountability over how the money was spent.

53. George Jerome Goodman (writing as "Adam Smith"), *Supermoney.* New York: Random House, 1972.

Goodman (known as Jerry) chose his pen name after Adam Smith, the father of market economics.

54. John Brooks, "A Wealth of Notions," *Washington Post,* October 22, 1972.

Chapter 36

1. Interview with Stan Lipsey. Scripps Howard owned 60% of the paper but had been ordered by the Department of Justice in 1968 to divest it on antitrust grounds because it also owned the *Cincinnati Post & Times-Star,* a competing paper. Blue Chip bought 10% of the *Enquirer*'s stock and tried to get the rest for $29.2 million in February 1971.

2. Scripps would have been interested in selling because it was looking at buying Journal Publishing and Albuquerque Publishing and could not own all three.

3. Graham thought that the only alternative to going public was to sell one of the company's TV stations, which she did not want to do. To protect the business from an unfriendly bidder, Beebe and family lawyer George Gillespie structured the stock sale in two tiers, with class A shares in the family's hands and class B stock, which carried diluted voting privileges, sold to the public. Katharine Graham, *Personal History.* New York: Alfred A. Knopf, 1997.

4. Graham told this story to Buffett.

5. Katharine Graham, *Personal History.*

6. Katharine Graham letter to Charlie Munger, December 23, 1974.

7. Katharine Graham, *Personal History.*

8. Katharine Graham interview with Charlie Rose, February 5, 1997.

9. Some of the nonvoting B shares went to Kay's brother, Bill, in exchange for an investment in the company. Kay's sisters were not investors in the *Post.* At the time, the unprofitable newspaper was less a financial asset than a public responsibility and a source of prestige.

10. Buffett's former golf coach Bob Dwyer was the office boy who performed this task, in between running copy for the *Post*'s editorial department.

11. Katharine Graham, *Personal History.*

12. These anecdotes are from *Personal History.*

13. C. David Heymann's *The Georgetown Ladies' Social Club* (New York: Atria Books, 2003)—a well-researched account of the most influential Washington hostesses and the private power they wielded—gave examples, such as a black eye, that indicated that on at least some occasions Phil Graham physically abused her.

14. Stories of the women with whom Phil Graham was involved and the allegation that he swapped girlfriends with Kennedy, including the actress-model Noel-Noel, are contained in *The Georgetown Ladies' Social Club.*

15. In her memoir, Graham attributed this partly to the subservience of women in her time and partly to her emotionally abusive upbringing. She seems to have had at least a partial grasp of her own role in enabling Phil's behavior.

16. Katharine Graham interview with Charlie Rose, February 5, 1997.

17. Ibid.

18. Interview with Don Graham.

19. Beebe had been a partner at Cravath, Swaine & Moore in New York and, under the direction of Don Swatland, in 1948 was instrumental in designing the structure that protected the *Post* from a sale outside the family.

20. Katharine Graham, *Personal History.*

21. McNamara later said he commissioned the "History of the United States Decision-Making Process on Vietnam Policy" to "bequeath to scholars the raw material from which they could reexamine the events of the time." Sanford J. Ungar, *The Papers and the Papers: An Account of the Legal and Political Battle over the Pentagon Papers 23-27.* New York: E. P. Dutton, 1972.

22. Dialogue between Graham and Bradlee has been condensed and edited for clarity from *Personal History* and her interview with Charlie Rose. Description of the scene is from *Personal History.*

23. Bob Woodward, "Hands Off, Mind On," *Washington Post,* July 23, 2001.

Chapter 37

1. Nixon made explicit threats about the licenses, but a paper trail did not surface to document this until May 1974 (Katharine Graham, *Personal History.* New York: Alfred A. Knopf, 1997). Graham filed an affidavit with the FCC on June 21, 1974, saying the challenge was "part of a White House–inspired effort to injure…the company in retaliation for its Watergate coverage." Morton Mintz, "Mrs. Graham Links White House, TV Fights," *Washington Post,* June 27, 1974; David E. Rosenbaum, "Threats by Nixon Reported on Tape Heard by Inquiry," *New York Times,* May 16, 1974.

2. Katharine Graham, *Personal History.*

3. Ibid.

4. All quotes on Meyer are from Cary Reich, *Financier: The Biography of André Meyer: A Story of Money, Power, and the Reshaping of American Business.* New York: William Morrow, 1983.

5. Cary Reich, *Financier.*

6. *"The whole company at one point got down to where it was selling for eighty million,"* Buffett says. *"We spent a little less than ten million bucks when all was said and done and paid a price that valued the company on average at a hundred million."*

7. Graham's memoir, which downplays her relationship with Meyer, credits Gillespie and Beebe for the idea of the two-class stock. Meyer's biographer, Cary Reich, credits Meyer for the idea. Given Meyer's talents as a banker, it seems unlikely he had no involvement.

8. Warren Buffett letter to Katharine Graham, May 1973.

9. Jim Hoagland, "A Journalist First," *Washington Post,* July 18, 2001.

10. Robert Kaiser, "The Storied Mrs. Graham," *Washington Post,* July 18, 2001.

11. Cary Reich used the term "irate" in *Financier.*

12. Interview with Arjay Miller.

13. Katharine Graham, *Personal History*.

14. "A Sure Thing? What Is Inside Information? Forget the black-and-white definitions. The real world often comes in gray, like at the San Jose Water Works," *Forbes,* September 1, 1973.

15. The company had disclosed in 1971 that the city was interested in buying it.

16. Interview with Bill Ruane.

17. Warren Buffett letter to Malcolm Forbes, August 31, 1973.

18. Interview with Bill Ruane.

19. Katharine Graham, *Personal History*.

20. Patrick Brogan, *The Short Life and Death of the National News Council: A Twentieth Century Fund Paper*. New York: Priority Press Publications, 1985. The Council survived for eleven years before giving up—a decade before the Internet became available—for lack of a viable outlet through which its findings could reach the public.

21. Interview with George Gillespie.

22. Interview with Don Graham.

23. Katharine Graham, *Personal History*.

24. October 20, 1973.

25. Graham's foreword to Meg Greenfield's *Washington.* New York: Public Affairs, 2001.

26. Graham more tactfully called him a "delightful and mischievous goad" in *Personal History*.

27. In her book, Graham recalls that "someone" mentioned the amortization of intangibles and that Howard Simons, unprompted, then challenged her to define it. Possibly Graham did not perceive herself as "showing off" when writing what was, after all, her own memoir.

28. Interview with Don Graham.

29. Interview with Liz Hylton.

30. The Dumbarton Oaks Conference; the Dumbarton Oaks Research Library and Collection.

31. Wisner was the widow of Frank Wisner, and married columnist Clayton Fritchey in 1975, becoming Polly Fritchey.

Chapter 38

1. Wattles, confusingly, bore the same name as Gurdon W. Wattles, the "streetcar king" of Omaha, who was no relation.

2. Interviews with Ed Anderson, Marshall Weinberg.

3. Buffett bought American Manufacturing at 40% of what he thought it was worth. "How Omaha Beats Wall Street," *Forbes,* November 1, 1969.

4. A couple of other people did what Wattles did—Thomas Mellon Evans and Jean Paul Getty. Buffett

followed Evans, too, while another Columbia friend, Jack Alexander, and his partner, Buddy Fox, followed Getty, who pyramided oil companies and wrote a book, *How to Be Rich* (not how to *get* rich). Evans, a Pittsburgh businessman, discussed in "Heirloom Collector," *Time,* May 11, 1959, operated through H. K. Porter and Crane Co. Wattles, who is virtually unknown today, was a director of Crane.

5. It didn't make you huge money unless you picked the shareholders' pockets, as some had done. An unscrupulous operator could milk the subsidiaries for money while saddling the shareholders of the parent company with an unsustainable amount of debt. John S. Tompkins, "Pyramid Devices of 20's Revived," *New York Times,* November 16, 1958.

6. "If I have seen further it is by standing on ye shoulders of giants." Letter from Isaac Newton to Robert Hooke, February 5, 1676.

7. "Fighting the Tape," *Forbes,* April 1, 1973. "I trust this man [Wattles] to do intelligent things," Ruane said. Shareholders had sued over the values in the merger, however, illustrating the conflicts created by the Wattles model.

8. Interview with Charlie Munger.

9. Blue Chip made two purchases totaling 137,700 shares, or 6%, of Wesco on July 11 and July 14, 1972. Between July 1972 and January 1973, Blue Chip bought another 51,300 shares, or 2% of the stock, through open market purchases on twenty different days.

10. "Not Disappointed, Says Analyst As Wesco, FSB Call Off Merger," *California Business,* March 15, 1973.

11. Wesco's equivalent book value per share at the exchange ratio offered was $23, compared to Santa Barbara's $8. Santa Barbara had zero unrestricted capital, whereas Wesco had $7 per equivalent share free net worth. Santa Barbara's earnings per equivalent share after bad debt accruals and deferred taxes were 28.7% lower than Wesco's.

12. This is Betty Casper Peters's recollection of how Buffett related the story to her.

13. A letter from Charlie Munger to Louis Vincenti, February 8, 1973, makes the case that Home Savings' (a California banking giant) cost structure was so low "because it is run like Wesco."

14. Interview with Betty Casper Peters.

15. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Wednesday, March 19, 1975, p. 53. Warren E. Buffett testimony, March 21, 1975, pp. 61–63.

16. Interview with Charlie Munger.

17. "It is awkward," he wrote, "when we want to talk to you about alternatives to be provided by us for Wesco shareholders, to have you sort of prevented from considering anything unless and until released by FSB [Santa Barbara] or actions of ours…. I guess all we can do is have everyone act as best he can as the matter unfolds to an outcome now not entirely clear to us." Charles T. Munger letter to Louis R. Vincenti, February 8, 1973.

18. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Wednesday, March 19, 1975, page 84.

19. Interview with Betty Casper Peters.

20. Minutes of the Special Meeting of Board of Directors of Wesco Financial Corporation, February 13, 1973.

21. Interview with Betty Casper Peters.

22. All analyst commentary from "Not Disappointed, Says Analyst As Wesco, FSB Call Off Merger," *California Business*.

23. Peters was grateful to them, writing to Don Koeppel two months later that the decision to kill the deal looked "heroic" because Santa Barbara's stock price had fallen from over $33 to $15.50.

24. Interview with Charlie Munger.

25. Blue Chip applied to the Federal Savings and Loan Insurance Corporation to buy 50% of Wesco, thereby turning Blue Chip, and potentially its affiliates Berkshire, Diversified, and others, into a savings-and-loan holding company. In the application, the companies said that Diversified had never considered Blue Chip a subsidiary but Diversified and its affiliates might be deemed to control Blue Chip by view of Buffett's ownership of the stocks of both as well as of Berkshire, which owned 17.1% of Blue Chip at the time.

26. Munger started looking at other California bank stocks and suggested that Wesco might buy a large block of Crocker National Bank.

27. "I have a personal, pronounced prejudice in favor of buying at a material discount from book value stock in extremely entrenched institutions which have earned between 11% and 13% on book value for a decade or more with a history of substantial and ever-increasing dividends. Moreover, I like the idea of diversifying the economic base at Wesco with something like a zero increase in overhead. I also like becoming the largest shareholder in substantial enterprises—on the theory that this adds a possible plus factor to investment performance." Charles T. Munger letter to Lou Vincenti, April 3, 1973.

28. Buffett's trading style that year suggested he might be pessimistic about the economy and was preparing for a downturn. He wrote straight covered-call options on Kennecott Copper and down-and-out options, a more sophisticated type of covered call that limits the downside and upside within a specified range, on several stocks such as Ford Motors, General Motors, and Black & Decker. Selling calls on the latter three economically sensitive stocks was not a market call, but does suggest that he was more pessimistic than optimistic about the economy. Letter from Warren Buffett to Jack Ringwalt, March 9, 1972.

29. At December 31, 1973, his *Post* stock was worth $7.9 million.

30. Catherine Elberfeld letter to Warren Buffett, May 1974.

31. Ben Graham wrote about this Eau Claire, Wisconsin, company in *The Intelligent Investor*.

32. *"I'd have made a hell of a lot more money if I hadn't sold it. I would have made a fortune out of the stock,"* Buffett says. He says he got off quickly when he learned the CEO had different deals with every director about pay. Vornado was under different management and owned discount stores. Today it is a real estate investment trust managed by Steven Roth.

33. Interview with Bob Malott.

34. Buffett says he immediately told Malott that FMC should buy back its own stock, which was cheap. Although FMC considered the idea, it didn't follow through.

35. Black enrollment had risen to one third and was projected to rise to nearly half in the fall. A desegregation suit was pending and the building did not conform to fire codes. Some white students had already transferred out of fears that Central and Tech High, the city's toughest school, would be merged. Dana Parsons, "Central Parents Express Fears, Seek Changes," *Omaha World-Herald,* May 9, 1974. The committee proposed changes that in effect created a magnet school oriented to college prep.

36. Mark Trustin, a neighbor, gave Hamilton to the Buffetts.

37. Interview with Susie Buffett Jr., who says she wasn't planning to become a police officer.

38. Interview with Peter Buffett.

39. Interview with Dave Stryker.

40. In the Temptations' world, men are the Daisy Maes: "Since I Lost My Baby," "The Way You Do the Things You Do," "(I Know) I'm Losing You," "I Can't Get Next to You," "Just My Imagination," "Treat Her like a Lady," and, of course, "Ain't Too Proud to Beg."

41. From several sources both close to Susie at the time and who knew her later.

42. Interview with Peter Buffett.

43. His dividends from Blue Chip were also about $160,000 per year before taxes.

44. By having Diversified buy insurance from ("reinsure") National Indemnity through its new subsidiary. The cash was transferred by paying a premium to Diversified. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, pp. 188–194.

45. By year-end 1973, Reinsurance Corp. of Nebraska (renamed Columbia Insurance) had amassed investments of $9 million, which is indicative of its cash flows.

46. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Wednesday, March 19, 1975. Both had previously owned some stock. Munger had bought a block and Gottesman bought stock his partners sold.

47. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, p. 193.

48. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, p. 190.

49. They were reported at the end of the year in DRC's annual report, but few people read it, and it took legwork and initiative to get more timely information from SEC Form 3s and 4s. DRC's 11.2% position was disclosed in BRK's 1973 annual report, as well as the fact that Warren and Susie owned 43% of DRC at the time too.

50. For $1.9 million.

51. Don Koeppel letter to Warren Buffett, June 15, 1973.

Chapter 39

1. From peak to trough in the Depression (September 3, 1929, to July 8, 1932), the Dow fell 89%. From peak to trough in the early 1970s (January 11, 1974, to December 6, 1974), the Dow fell 45%—the two worst bear markets of the century.

2. Robert Redford interview, cited by Graham in *Personal History.* New York: Alfred A. Knopf, 1997.

3. Katharine Graham, *Personal History.*

4. The television stations owned by both would have created a conflict.

5. Katharine Graham, *Personal History*.

6. Al Pagel, "What Makes Susie Sing?" *Omaha World-Herald,* April 17, 1977.

7. Interview with Gladys Kaiser.

8. From a letter that Graham wrote Buffett, reprinted in *Personal History.* Don Graham recalls his mother telling him that Susie cooked eggs for her, and Susie and Warren watched Kay eat them and did not eat any themselves.

9. Measured from its peak.

10. Interview with Charlie Munger.

11. "Fighting the Tape," *Forbes,* April 1, 1973.

12. The seat would have sold for a quarter of what Ruane, Cunniff had paid for it.

13. The record was 1970: Sequoia 12.11% vs. S&P 20.6%; 1971: Sequoia 13.64% vs. S&P 14.29%; 1972: Sequoia 3.61% vs. S&P 18.98%; 1973: Sequoia (24.8%) vs. S&P (14.72%).

14. Marshall Weinberg as well as Buffett confirmed this in interviews. Malott says he does not recall it.

15. Loomis joined Sandy Gottesman at First Manhattan; Brandt went to work at Abraham & Co.

16. "Look at All Those Beautiful, Scantily Clad Girls Out There!" *Forbes,* November 1, 1974.

17. "*Forbes* didn't use what I considered to be the most significant line," said Buffett in a letter to Pat Ellebracht on October 24, 1974, repeating this quote.

18. Interview with Rod Rathbun; Omni arbitration files of the National Indemnity Company.

19. Compounded over thirty years at 20%, this was perhaps a $2.4 billion investment return forgone. Buffett and Munger have referred to it as the greatest missed opportunity in the history of Berkshire Hathaway. The details are arcane but the essence of the story is as portrayed here.

20. "Why the SEC's Enforcer Is in Over His Head," *BusinessWeek,* October 11, 1976.

21. Interview with Verne McKenzie.

22. Letter from Charlie Munger to Chuck Rickershauser "re: Diversified Retailing—Berkshire Hathaway Proposed Merger," October 22, 1974.

23. Interview with Betty Casper Peters.

24. Interview with Verne McKenzie.

25. Robin Rickershauser, who has often heard this clever trope from her husband, did not realize he originated it until contacted by the author.

26. If true, investors would have been selling without required information about the buyer and his reasons.

27. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, p. 112.

28. The increase in Santa Barbara's price if the deal collapsed would only partially hedge this risk.

29. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, pp. 112–13.

30. Interview with Judge Stanley Sporkin.

31. Ibid. This lawyer was so particularly ferocious that the author was asked not to mention his name.

32. A thick file of documents produced in response to the SEC's February 1975 subpoena illustrates several points: 1) it contained no evidence that Buffett bought on inside information or expecting a takeover; 2) Buffett had become expert on water company regulation and ratemaking, and his interest and expertise in this narrow subject was prodigious; 3) this aspect of the investigation must have been intrusive and an embarrassing form of déjà vù, as it included production of his correspondence with *Forbes* that attempted to clear his name.

33. Partly because of state restrictions on how much stock any one insurance company could hold, the diagram was more complicated than it would have been otherwise. The version shown on pages 412–413 was created by Verne McKenzie and updated through 1977 (i.e., includes the *Buffalo News*). Berkshire was still negotiating with the SEC as late as 1978.

34. During Buffett's testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Friday, March 21, 1975, p. 125, he acknowledged that he and Munger had been buying shares of Wesco in the open market during a tender offer and Rickershauser had advised him to stop, saying that they should use only tender offers to accumulate further shares (which they did). Rickershauser interjected, "I want the record to be clear that I did not tell them it was illegal to do what was done. I told them it would be hard to convince somebody that in hindsight they may not have intended to do what they did. You can swear me in if you want to on that one. I didn't want to be right."

35. Said to a colleague.

36. The SEC apparently considered Buffett, Munger, and Guerin's interests and the companies a controlled group for purposes of tender offers. The combination of Warren (11%), Susie (2%), Munger and his partners (10%), Berkshire Hathaway (26%), and Diversified (16%) controlled 65% of Blue Chip's stock. Warren and Susie owned 36% of Berkshire and 44% of DRC. Munger owned 10% of DRC. DRC owned 15% of BRK and 16% of BC. BC owned 64% of Wesco.

37. The "harm principle" was articulated by scholars such as John Locke, Wilhelm von Humboldt, and John Stuart Mill, who argued that the sole purpose of law was to prevent harm, and the individual's liberty should not be encroached otherwise. The harm principle is the basis for certain portions of the U.S. Constitution.

38. Chuck Rickershauser Jr. letter to Stanley Sporkin, November 19, 1975.

39. Chuck Rickershauser Jr. letter to Stanley Sporkin, December 1, 1975.

40. Warren E. Buffett testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Friday, March 21, 1975, p. 157.

41. Charles T. Munger testimony, *In the Matter of Blue Chip Stamps, Berkshire Hathaway Incorporated,* HO-784, Thursday, March 20, 1975, p. 197.

42. Interview with Judge Stanley Sporkin. Sporkin served as general counsel to the CIA after leaving the SEC in 1981. He became Judge of the U.S. District Court for the District of Columbia in 1985 and served till his retirement in 2000.

43. Ibid. For more on Sporkin see Jack Willoughby, "Strictly Accountable," *Barron's*, April 7, 2003; Peter Brimelow, "Judge Stanley Sporkin? The Former SEC Activist Is Unfit for the Federal Branch," *Barron's,*

November 4, 1985; Robert M. Bleiberg, "Sporkin's Swan Song?" *Barron's,* February 2, 1981; "Why the SEC's Enforcer Is in Over His Head," *BusinessWeek,* October 11, 1976.

44. "I bet on a good horse," says Sporkin, "and the horse came in."

45. After the deregulation of the S&L industry, Santa Barbara lost $80.9 million during fifteen straight quarters in the early 1980s. In June of 1984, Ivan Boesky was close to buying it and infusing it with a desperately needed $34 million, but that fell through. In 1990 it was seized by federal regulators, placed in conservatorship, and operated by the Resolution Trust Corp. until Bank of America bought it in 1991 for $41 million.

46. The company also paid a $115,000 fine. "Consent to Judgment for Permanent Injunction and Other Relief," "Final Judgment for Permanent Injunction and for Other Relief and Mandatory Order and Consent with Respect Thereto," and "Complaint for a Permanent Injunction and Other Relief," *In the Matter of Securities and Exchange Commission vs. Blue Chip Stamps,* June 9, 1976.

47. The SEC Advisory Committee on Corporate Disclosure, July 30, 1976.

Chapter 40

1. Doug Smith, "Solid Buffett Voice Melts Debut Jitters," *Omaha World-Herald,* May 9, 1975.

2. Interview with Charlie Munger.

3. Charles Munger letter to Katharine Graham, December 9, 1974. Munger wrote "dilly" when he apparently meant "silly." For clarity, "silly" has been used in the text.

4. Interview with Fred Stanback.

5. Interviews with Roxanne Brandt, Walter Schloss. Brandt later jokingly admitted this was grounds for divorce.

6. *New York Daily News,* October 30, 1975.

7. As of December 2007, these shares would be worth $747 million.

8. That Buffett, who had never borrowed a significant amount of money in his life, thought it made sense for his sisters to buy Berkshire stock using borrowed money, with only 5% down, speaks volumes about how cheap he thought the stock was and how good its prospects were at the time.

9. Berkshire owned so much *Washington Post* stock and Buffett's position on the board was such that, if it bought a TV station, its ownership would be attributed to the *Washington Post,* pushing it over the limit of five stations that it could own.

10. Howard E. Stark letter to Warren Buffett, June 18, 1975. Also see Lee Smith, "A Small College Scores Big in the Investment Game," *Fortune,* December 18, 1978.

11. Katharine Graham, *Personal History.* New York: Alfred A. Knopf, 1997.

12. The new printing-press technology that owners had installed made management hostage to the skilled employees who knew how to run the complex equipment.

13. Katharine Graham, *Personal History.*

14. Ibid.

15. Interview with George Gillespie.

16. According to *Personal History,* this contract would have given the pressmen the highest wages in the nation and security from layoffs. Negotiations broke down in part because the *Post* refused to hire back the workers who had damaged the presses.

17. According to *Personal History,* fifteen former *Post* pressmen pleaded guilty to various misdemeanor charges. Six who had damaged presses and committed more serious crimes were jailed.

18. They sold their interest in Source Capital to its managers.

19. With the press strikes and Watergate affair behind her, Katharine Graham began to focus on growth at the *Washington Post* in the mid-1970s. Up until then, the company didn't have sufficient profits and there was "little more than a hit-or-miss strategy" for growth (*Personal History*). Sales and earnings started to take off in 1976, around the time that they started buying back company stock. Earnings per share were $1.36 in 1976 vs. $0.36 in 1970. Return on equity was 20% compared to 13%. Profit margin grew to 6.5% from 3.2%. And it kept improving from there (Value Line report, March 23, 1979).

20. Charles Munger letter to Katharine Graham, November 13, 1974.

21. Interview with Don Graham.

22. C. David Heymann, *The Georgetown Ladies' Social Club.* New York: Atria Books, 2003.

23. Interview with Don Graham.

24. Interview with Susie Buffett Jr., who credits her parents for not interfering.

25. Interview with Susie Buffett Jr.

26. Interview with Dick and Mary Holland.

27. Interview with Susie Buffett Jr.

28. Ibid.

29. Interview with Howie Buffett.

30. In an interview Peter Buffett described his routine at this time.

31. According to friends of Susie's who say she blamed Graham for the relationship.

32. Al Pagel, "What Makes Susie Sing?" *Omaha World-Herald,* April 17, 1977.

33. Ibid.

34. This is Jack Byrne's recollection of Davidson's remonstration in an interview. Jack being a colorful guy, it is possible that his recollection is a bit more colorful than what Davidson actually said.

35. Interview with Tony Nicely.

36. Warren Buffett memo to Carol Loomis, July 6, 1988.

37. By 1974, the whole insurance industry was producing what rating agency A. M. Best called "unbearable" losses of $2.5 billion from a vicious price war and inflation of everything from car repairs to lawsuits. (*A.M. Best Company Comment on the State of and Prospects for the Property/Liability Insurance Industry,* June

1975.) The states were also passing "no-fault" insurance legislation, which meant that insurers had to pay for an accident regardless of who caused it. The federal government also slapped price controls on the industry during the Middle East war. Meanwhile, the devastating stock market of 1973–74 had wiped so much value from GEICO's stock portfolio that for every share of stock, investments that had once been worth $3.90 were now worth a dime a share (Leonard Curry, "Policy Renewed: How GEICO Came Back from the Dead," *Regardie's,* October/November 1982).

38. GEICO had $500 million in premiums and would have needed capital of $125 million to meet regulatory and rating agency standards for leverage.

39. Interview with Sam Butler.

40. Interview with Jack Byrne. "The bastards at Travelers had passed me over for president for Ed Budd," recalls Byrne (who likes to tell this story and tells it often). "A million dollars invested with me is now worth a billion, and a million dollars invested with Ed Budd is now worth $750,000. And I used to be pissed, but obviously I'm more mature about it now. Well, I'm still pissed." This story is also recounted in William K. Klingaman, *GEICO, The First Forty Years.* Washington, D.C.: GEICO Corporation, 1994.

41. Interview with Jack Byrne.

42. "GEICO's Plans to Stay in the Black," *BusinessWeek,* June 20, 1977. It is Byrne's impression that Wallach did not like him.

43. GEICO had too little capital under regulatory standards to ensure its ability to pay claims on all its policies. By transferring some of its business to competitors, the company would relieve the strain on capital.

44. Interview with Rhoda and Bernie Sarnat.

45. Interview with Lou Simpson.

46. "Leo Goodwin Jr. Is Dead at 63; Headed GEICO Insurance Concern," *New York Times,* January 18, 1978; "Leo Goodwin, Financier, Son of Founder of GEICO," *Washington Post*, January 18, 1978.

47. Interview with Don Graham.

48. Leonard Curry, "Policy Renewed."

49. Warren Buffett memo to Carol Loomis, July 6, 1988.

50. Blue Chip bought 14% of Pinkerton's in March 1976 and Buffett went on the board, a thrill to the erstwhile boy detective who had also busted open Boys Town's hidden war chest.

51. Interview with Bill Scott.

52. Wallach had invited big insurers to buy up 40% of GEICO's reinsurance treaties, giving them until June 22 to make their decision to participate. Not enough insurers signed up. Wallach was supposed to decide by Friday, June 25, whether to shut GEICO down. He extended the deadline and, in mid-July, revised his rescue plan—requiring only 25% of GEICO's premiums to be taken up by the insurance pool and lowering the amount of capital they needed to raise by year-end to $50 million. Reginald Stuart, "Bankruptcy Threat Fails to Change Status of GEICO," *New York Times,* June 26, 1976; Reginald Stuart, "The GEICO Case Has Landed in His Lap," *New York Times,* July 4, 1976; Matthew L. Wald, "GEICO Plan Is Revised by Wallach," *New York Times,* July 16, 1976.

53. National Indemnity was a specialty company, not yet so large or well-known that it would cause too much push-back on the grounds of helping a competitor. Buffett's other insurers, as will be seen, were struggling.

54. Who knows what General McDermott actually wrote, but any endorsement at all from him would have carried weight among insurers.

55. Some of the people instrumental in making it happen were former GEICO employees, according to Byrne.

56. Interview with Jack Byrne.

57. John Gutfreund quoting Frinquelli in an interview. Frinquelli did not return calls requesting an interview.

58. Interview with Sam Butler.

59. Leonard Curry, "Policy Renewed." According to some sources, Butler also had an instrumental role in convincing Gutfreund to underwrite the deal.

60. Without a doubt it had not. Among other things, GEICO had failed to disclose a change in method of calculating loss reserves, which had enabled it to boost profits by $25 million during the second and third quarters of 1975. "In the Matter of GEICO et. al.," October 27, 1976.

61. Leonard Curry, "Policy Renewed."

62. Interview with John Gutfreund.

63. An indication of "aftermarket support" was a principal component in underwriters' assessments of how a stock might trade once it was listed. The presence of aftermarket support helped prevent a "busted deal" in which the underwriter had to buy back the offering with the firm's own capital.

64. Byrne's recollection is that Tom Harnett, the New York superintendent, helped rally the industry to get behind the reinsurance. Harnett, he believes, had an incentive because the New York guaranty fund was prefunded and had invested in Big Mac New York City bonds, which were selling at a fraction of their par value. The insolvency funds in effect had evaporated in the wake of New York City's financial crisis.

65. Byrne has told this story more vividly in times past. In Roger Lowenstein's *Buffett: The Making of a American Capitalist* (New York: Doubleday, 1996), he supposedly said to Sheeran, "Here's your fucking license. We are no longer a citizen of the state of New Jersey." He calls Sheeran "the worst insurance commissioner ever."

66. Disgruntled employees, hearing the news about their jobs, started throwing policies out the top-story window. "Files were floating all around North Jersey in the air," says Byrne. Nobody knew this until GEICO moved the claims office to Philadelphia, "when we went to move the files and they weren't there." Byrne estimates the lost data cost the company as much as $30–40 million in excess claims. GEICO also gave up its license in Massachusetts. It stopped writing business in many other states without surrendering the right to do so in the future. In total, the company nonrenewed 400,000 out of its 2.2 million policyholders.

67. Interview with Jack Byrne. The author first heard this story from a secretary who formerly worked for Byrne.

68. Interview with Tony Nicely. The length of these meetings sounds incredible, but Byrne seemed to have an almost superhuman energy.

69. Interview with Jack Byrne.

70. James L. Rowe Jr., "Fireman's Fund Picks Byrne," *Washington Post,* July 24, 1985; Sarah Oates, "Byrne Pulled GEICO Back from Edge of Bankruptcy," *Washington Post,* July 24, 1985.

71. Graham Group members, Buffett friends, and Berkshire employees such as Marshall Weinberg, Wyndham Robertson, Verne McKenzie, Gladys Kaiser, Bob Goldfarb, Tom Bolt, Hallie Smith, Howie Buffett, and Peter Buffett all remember Grossman fondly.

Chapter 41

1. Christopher Ogden, *Legacy, A Biography of Moses and Walter Annenberg.* Boston: Little, Brown, 1999; John Cooney, *The Annenbergs: The Salvaging of a Tainted Dynasty.* New York: Simon & Schuster, 1982.

2. Ogden, in *Legacy,* cites Annenberg as saying he declined to buy the *Washington Times-Herald* from Colonel McCormick and convinced McCormick to sell to the Grahams despite their reservations about Phil Graham's drinking and mental stability. Thus, he felt responsible for putting together the newspaper marriage that made the *Washington Post* what it had become. He felt slighted because the Grahams had never credited him. Buffett says that Annenberg was exaggerating his role and that Graham viewed this notion as ridiculous.

3. Drew Pearson, "Washington Merry-Go-Round: Annenberg Lifts Some British Brows," *Washington Post,* February 24, 1969.

4. Buffett's recollection of Annenberg's perspective on Nixon.

5. Description of the Annenbergs' reactions is from *Legacy.* Drew Pearson, "Senators Wary on Choice of Annenberg," *Washington Post,* March 5, 1969.

6. The comparison with Nixon was made by Annenberg's biographers.

7. In fact, the Annenbergs' investment of time, personal funds, and good judgment in a thoughtful restoration of Winfield House, the ambassadorial residence, played a key role in their acceptance in Britain.

8. C. David Heymann, *The Georgetown Ladies' Social Club* (New York: Atria Books, 2003) and *Legacy.* This is Walter Annenberg's account, and there is no telling what was really said. But, by all accounts, he was offended.

9. In the end, he gave most of his money to the Annenberg Foundation and his art collection to the Metropolitan Museum of Art.

10. Lally Weymouth, "Foundation Woes: The Saga of Henry Ford II, Part II," *New York Times Magazine,* March 12, 1978.

11. Walter Annenberg letter to Warren Buffett, October 1, 1992.

12. Donner was not entirely obliterated. In 1960, seven years after he died at age eighty-nine, the $44 million in assets in his foundation was divided equally—between a newly formed Donner Foundation and the original foundation, which changed its name to the Independence Foundation (www.independencefoundation.org).

13. Walter Annenberg letter to Warren Buffett, October 1, 1992.

14. Said to the author in an interview in 2003—an indicator of the direction of his thoughts at the time.

15. While most mergers are done for stock (if only for tax reasons), this subtle underlying psychology gives the seller a slight advantage. The willingness to issue stock implies, by its nature, that the buyer prefers the seller's business to his own. The exception is using an overpriced stock to buy an underpriced company from a naive seller, which aggressive buyers sometimes do, although not nearly as often as they think.

16. Graham's term, from her autobiography. Liz Smith called Graham Buffett's "frequent hostess" and Diana McLellan said, "All the way up in New York, they're talking about Kay Graham and Warren Buffet [sic]…but oh, so discreetly." Diana McLellan, "The Ear," *Washington Star,* March 12, 1977; Liz Smith,

"Mystery Entwined in Cassidy Tragedy," *Chicago Tribune,* March 6, 1977.

17. Heymann, *The Georgetown Ladies' Social Club.*

18. See, for example, her relationships with Jean Monnet, Adlai Stevenson.

19. The letter was described this way in Lowenstein, *Buffett.*

20. Graham showed Dan Grossman a copy of this letter. Susan Buffett also showed Doris Buffett a copy of this letter. Graham's papers currently are under seal.

21. Roger Lowenstein, *Buffett.*

22. "Interview with Susan Buffett," *Gateway*, March 5, 1976.

23. Peter Citron, "Seasoning Susie," *Omaha World-Herald,* April 7, 1976.

24. "Buffett Serious," *Omaha World-Herald,* September 14, 1976.

25. Buffett considered buying Alfred Knopf's apartment at 24 West 55th Street, later one of two landmarked Rockefeller apartments.

26. Interview with Susie Buffett Jr.

27. Interview with Al "Bud" Pagel.

28. Denenberg declined to be interviewed.

29. Al Pagel, "What Makes Susie Sing?" *Omaha World-Herald,* April 17, 1977.

30. Ibid.

31. Interview with Al "Bud" Pagel.

32. Ibid.

33. Peter Citron, "Seasoning Susie."

34. Interview with Stan Lipsey. See Leo Litwak, "Joy Is the Prize: A Trip to Esalen Institute," *New York Times Magazine,* December 31, 1967.

35. Steve Millburg, "Williams' Songs Outshine Voice," *Omaha World-Herald,* September 5, 1977.

36. Interview with Astrid Menks Buffett. The sleeping Warren famously did not notice whether Susie was there. In one story related by Racquel Newman, she decided to drive to Dottie's to play music at around ten or eleven at night, ran out of gas in a snowstorm at midnight on her way home, and instead of waking Warren, called a friend and went on an all-night obstacle-filled expedition to a gas station on the interstate, delayed by a tractor-trailer jackknifed on the freeway. She finally got home shortly before dawn. Warren never knew she was gone.

37. Said to a friend of the couple's who believes that Susie was probably sincere, both because she believed Warren really was that dependent on her and because of his preoccupation with suicide, linked to the many suicides among the Stahl family and the Buffetts' friends.

38. Warren Buffett, "How Inflation Swindles the Equity Investor," *Fortune,* May 1977. In a letter to the Graham Group, September 27, 1977, Bill Ruane describes how "This article can well serve as a basis for a

discussion of so many things which are central to our economic concerns today. The article not only deals with the central theme of inflation but also with the effects of taxes, rate of return, dividend paying capacity and other elements which are crucial to the appraisal of aggregate values in our economic system."

39. The Buffett Group would take this problem up again and again. Its members were pessimistic about whether the problem could be solved, for they doubted, with good reason, that Congress had the necessary resolve to control the federal budget over the long term.

40. Interview with Marshall Weinberg.

41. The $72 million includes his holdings in BRK, DRC, and Blue Chip Stamps at year-end 1977. Susie added another $6.5 million to this total. This does not include his indirect holdings through the three companies' cross-holdings of each other.

42. Interview with Peter Buffett.

43. Interview with Tom Newman.

44. Two sources have confirmed this.

45. Interview with Astrid Buffett.

46. Ibid.

47. Interview with Michael Adams.

48. Interview with Astrid Buffett.

49. The 1977 letter contains significantly more "teaching" content than its predecessor. Although Buffett had control of Berkshire for twelve years previously, the 1977 letter was the first to be collected in a bound collection of letters he used to hand out to friends and is the first year featured on Berkshire's website.

Chapter 42

1. Interview with Astrid Buffett.

2. Interview with Michael Adams.

3. Interview with Kelly Muchemore.

4. From a close friend of the family.

5. Buffett explained in conversation and a letter to the author how he felt, separating his life into two stages with age forty-seven as the turning point.

6. To the end of her life, Estey wrote letters with "Mrs. Benjamin Graham" embossed on her stationery.

7. Interview with the author, 2003.

8. Katharine Graham, *Personal History*. New York: Alfred A. Knopf, 1997.

9. Interview with Stan Lipsey.

10. Interview with Sharon Osberg.

11. Astrid Buffett recalled the VCR conversation in an interview.

12. Jeannie Lipsey Rosenblum and others recall the details in interviews.

13. Interview with Peter Buffett.

14. Bryant campaigned to make it illegal for gays to teach in public schools in Dade County, Florida, and succeeded in passing a civil-rights ordinance against gays.

15. The price included $1.5 million in pension liabilities. Blue Chip Stamps Annual Report, 1977. Blue Chip borrowed $30 million from a bank in April 1977 to finance the purchase.

16. Berkshire had assets of $379 million, Blue Chip had $200 million, DRC had $67.5 million at year-end 1977.

17. Warren and Susie personally owned 46% of Berkshire (both directly and indirectly, through their ownership of Blue Chip and Diversified, which owned Berkshire stock), and 35% of Blue Chip (both directly and indirectly).

18. Murray Light, *From Butler to Buffett: The Story Behind the Buffalo News* (Amherst, NY: Prometheus Books, 2004), who notes that only in the face of an inquiry from the Human Rights Commission in the early 1970s did Butler begin publishing wedding photos of African-Americans.

19. Interview with Stan Lipsey.

20. The *Evening News* put out a Saturday edition, but its weak ad lineage demonstrated the power of the Sunday edition of the *Courier-Express.*

21. If the trend had continued without the *Evening News* starting a Sunday paper, the logical outcome would have been either a joint operating agreement or outright acquisition of the *Courier-Express* to combine the papers—both expensive alternatives.

22. *Buffalo Courier-Express, Inc., v. Buffalo Evening News, Inc.,* Complaint for Damages and Injunctive Relief for Violation of the Federal Antitrust Laws (October 28, 1977).

23. Former *Courier-Express* reporter Michael A. Hiltzik posted on June 20, 2000, on Jim Romenesko's "Media News Extra," a recollection of the staff writing puff pieces on every local state judge in order to flatter whichever one was chosen. It was a "misguided strategy," he said, as the trial took place in federal court under Brieant. One of the profiles supposedly was titled "Judge Loses Firmness When He Doffs His Robe."

24. Interview with Ron Olson.

25. Jonathan R. Laing, "The Collector: Investor Who Piled Up $100 Million in the '60s Piles Up Firms Today," *Wall Street Journal,* March 31, 1977.

26. Testimony of Buffett, *Buffalo Courier-Express, Inc., v. Buffalo Evening News, Inc.,* November 4, 1977.

27. In Roger Lowenstein's *Buffett: The Making of an American Capitalist,* Bob Russell cited Warren as a boy wanting to charge money to people driving by the Russells' house. Buffett does not remember the incident, but if it occurred, most likely he was influenced by the city's efforts to convert the Douglas Street toll bridge—the only passageway over the Missouri River—to a free bridge, one of the most widely reported local news stories during his early youth.

28. The bridge was sold to Marty Maroun in 1979 for $30 million, 30% less than the inflation-adjusted cost of building it thirty years earlier. Maroun parlayed the bridge into an enormous fortune.

29. Findings and Conclusions, Motion for Preliminary Injunction, *Buffalo Courier-Express, Inc., v. Buffalo Evening News, Inc.,* November 9, 1977.

30. Dick Hirsch, "Read All About It," "Bflo Tales" in *Business First,* Winter 1978.

31. In its first full year under Buffett. Murray Light, *From Butler to Buffett.*

32. Interview with Stan Lipsey.

33. Ibid.

34. *Buffalo-Courier Express, Inc., v. Buffalo Evening News, Inc.,* United States Court of Appeals, Second Circuit, 601 F.2d 48, April 16, 1979.

35. Warren Buffett, "You Pay a Very High Price in the Stock Market for a Cheery Consensus," *Forbes,* August 6, 1979.

36. Interview with Wally Walker. Jobs did not respond to repeated requests for comment.

37. Warren Buffett, "You Pay a Very High Price in the Stock Market…."

38. Interview with Stan Lipsey.

39. Blue Chip Stamps 1980 annual report to shareholders.

40. Janet Lowe, *Damn Right!: Behind the Scenes with Berkshire Hathaway's Charlie Munger,* New York: John, Wiley & Sons, 2000.

41. Ibid.

42. Warren Buffett memo to employees, December 2, 1980.

43. At first, management and the unions tried to publish without the drivers (*Buffalo Evening News,* December 2, 1980). The striking union walked out over a pay difference of $41 a week.

44. It was selling 195,000 papers on Sundays, about $^{2}/3$ of its rivals. From Lowenstein, *Buffett,* Audit Bureau of Circulations figures as of March 1982.

45. The Blue Chip Stamps 1980 annual report to shareholders notes the litigation became "less active and costly" that year.

46. Interview with Ron Olson.

Chapter 43

1. From $89 million at the end of 1978 to $197 million in August 1980.

2. Interview with Charlotte Danly Jackson.

3. Interview with Verne McKenzie.

4. Affiliated Publications—bought for $3.5 million, jumped to $17 million after nine years. The *Washington Post*—bought for $10.6 million, now worth $103 million. GEICO—bought for $47.1 million, now worth almost seven times that, $310 million. Berkshire's total common stock portfolio was worth double its cost.

5. Buffett and Munger took out a loan of $40 million from Bank of America National Trust and Savings

Association for Blue Chip to protect against a rush of redemptions, according to Munger's testimony in the Blue Chip case.

6. In 1976, the U.S. District Court in Los Angeles had said that Blue Chip no longer had to dispose of one third of its business, recognizing that it was impractical after management contacted more than eighty potential buyers and had no serious bids. Sales shrank from $124 million to $9.2 million. The woes of the *Buffalo News,* which Blue Chip owned, made valuing Blue Chip problematic until 1983, given Buffett's proportional interests in the different companies versus other shareholders, principally Munger.

7. Berkshire Hathaway 1983 annual report.

8. In 1984, during a period of relatively high inflation, the union agreed to a wage freeze.

9. The Bank Holding Company Act of 1956 placed restrictions on bank holding companies (those owning more than 25% of two or more banks, i.e., the J. P. Morgans) owning nonbanking interests, in order to avoid monopolistic control in the banking industry. It was amended in 1966 and again in 1970 to further restrict the nonbanking activities of one-bank holding companies (such as Berkshire). In 1982, it was amended to further forbid banks from engaging in insurance underwriting or agency activities. In 1999, the Gramm-Leach-Bliley Act repealed parts of these acts.

10. Interview with Verne McKenzie. According to him and Buffett, Associated was never able to recover from the disintegration of urban centers after the 1960s and adapt to the new culture required to sell discount dresses in shopping malls.

11. Interview with Charlie Munger.

12. Interview with Howie Buffett.

13. Interviews with Dan Grossman, Peter Buffett.

14. Interview with Peter Buffett.

15. Interviews with Marvin Laird, Joel Paley.

16. Interview with Howie Buffett.

17. Ibid. As Susie Jr. says, "When Howie dies, it will be no ordinary death. It will probably be by falling out of a helicopter into a polar bear's mouth."

18. For a four-hundred-acre farm.

19. Interviews with Howie Buffett, Peter Buffett.

20. Peter Kiewit Sons' Inc. was founded by the original Peter Kiewit, a bricklayer of Dutch descent, in 1884. Dave Mack, "Colossus of Roads," *Omaha* magazine, July 1977; Harold B. Meyers, "The Biggest Invisible Builder in the World," *Fortune,* April 1966.

21. When Kiewit died, Buffett got the chance to take an apartment in Kiewit Plaza. He would have loved to do it, but Astrid didn't want to leave her garden. So they stayed on Farnam Street.

22. "Peter Kiewit: 'Time Is Common Denominator,'" *Omaha World-Herald,* undated, approximately November 2, 1979; Robert Dorr, "Kiewit Legacy Remains Significant," *Omaha World-Herald,* November 1, 1999; Harold B. Meyers, "The Biggest Invisible Builder in the World" interview with Walter Scott Jr., Peter Kiewit's successor, who also had an apartment at Kiewit Plaza.

23. Interview with Walter Scott Jr.

24. Peter Kiewit died on November 3, 1979. Warren Buffett, "Kiewit Legacy as Unusual as His Life," *Omaha World-Herald,* January 20, 1980.

25. Buffett read Flexner's autobiography three or four times and gave copies to his friends.

26. $38,453 for the year ended June 1980, of which $33,000 went toward colleges, the rest toward local organizations. Five years earlier, in June 1975, the foundation had assets of $400,000, with gifts of $28,498 to similar organizations.

27. Rick Guerin letter to Joe Rosenfield, October 1, 1985.

28. Warren Buffett letter to Shirley Anderson, Bill Ruane, and Katherine (Katie) Buffett, trustees of the Buffett Foundation, May 14, 1969.

29. Richard I. Kirkland Jr., "Should You Leave It All to the Children?" *Fortune,* September 29, 1986.

30. Larry Tisch as quoted by Roger Lowenstein, *Buffett.: The Making of an American Capitalist.* New York Doubleday, 1996. Tisch is deceased.

31. Kirkland, "Should You Leave It All to the Children?"

32. Warren Buffett letter to Jerry Orans, cited in Lowenstein, *Buffett*.

Chapter 44

1. *The Dream that Mrs. B Built,* May 21, 1980, Channel 7 KETV. Mrs. Blumkin's quotes have been rearranged and slightly edited for length.

2. Ibid.

3. "The Life and Times of Rose Blumkin, an American Original," *Omaha World-Herald,* December 12, 1993.

4. Ibid.

5. Minsk, near Moscow, is relatively close to the Eastern European border of Russia, which would have been a difficult passage during the war. Her route created a longer trip than traveling between San Francisco and New York by train three times, then winding back to Omaha.

6. "The Life and Times of Rose Blumkin, an American Original."

7. This and most of the other details of Mrs. B's journey are from a Blumkin family history.

8. *The Dream that Mrs. B Built.*

9. Around 1915, roughly 6,000 Russian Jews lived in Omaha and South Omaha, part of a general migration beginning in the 1880s to escape the pogroms (anti-Jewish riots) that began after the assassination of Czar Alexander II. Most started out as peddlers and small-shop owners, serving the large immigrant working class drawn by the railroads and stockyards. Until 1930, Omaha had the largest percentage of foreign-born residents of any U.S. city. Lawrence H. Larsen and Barbara J. Cottrell, *The Gate City.* Lincoln: University of Nebraska Press, 1997.

10. Interview with Louis Blumkin. His father was comparing the pawnshop to the many banks that failed during this period.

11. *The Dream that Mrs. B Built.*

12. Ibid.

13. Louis Blumkin, who says she sold for $120 coats that cost her $100 and retailed for $200 elsewhere in town.

Chapter 45

1. Interview with Peter Buffett.

2. Interview with Doris Buffett.

3. Witnessed by a source close to the family who described it in an interview.

4. AIDS had first been discovered among homosexual men in the summer of 1981, but it was reported as pneumonia and as a rare, fatal form of cancer. President Reagan made his first mention of AIDS in September 1985 after his friend, the actor Rock Hudson, announced that he had been diagnosed with the disease.

5. Interagency Coalition on AIDS and Development. Also see *And the Band Played On* (New York: St. Martin's Press, 1987) by journalist Randy Shilts, who covered AIDS full-time in the early '80s for the *San Francisco Chronicle.*

6. Interview with Marvin Laird and Joel Paley.

7. This story was pieced together from conversations with a number of sources.

8. Alan Levin, "Berkshire Hathaway to Close," *New Bedford Standard-Times,* August 12, 1985.

9. A four-year-old loom that had cost $5,000 went for $26 as scrap. Some of the equipment went to a textile museum.

10. Buffett used the term "disaster" in the 1978 chairman's letter, discussing NICO workers' comp businesses' bad performance, which he laid largely at the door of industry problems.

11. Interviews with Verne McKenzie, Dan Grossman. The man was an agent who allegedly embezzled from Berkshire.

12. Interview with Tom Murphy.

13. Interview with Verne McKenzie.

14. Interview with Dan Grossman.

15. Several reinsurance managers presided during a short-lived interregnum: Brunhilda Hufnagle, Steven Gluckstern, and Michael Palm. For various reasons, none of them stuck.

16. Sir Arthur Conan Doyle, *The Memoirs of Sherlock Holmes: The Adventure of Silver Blaze.* London: George Newnes, 1894. (The story in Mark Haddon's prize-winning novel *The Curious Incident of the Dog in the Night-time* [New York: Doubleday, 2003] kicks off with a dead poodle speared with a garden fork.)

17. Rob Urban, "Jain, Buffett Pupil, Boosts Berkshire Cash as Succession Looms," *Bloomberg News,* July 11, 2006. While the author has been acquainted with Jain for years, he declined repeated requests to be interviewed.

Chapter 46

1. The Dow was sitting at 875 on the first day of 1982. It had hit that level for the first time back in September 1964.

2. Corporate profits reached what would become the second-lowest point in a fifty-five-year period in 1983 (the lowest was 1992), according to Corporate Reports, Empirical Research Analysis Partners. Data 1952 through 2007.

3. Banks lost their fear of bad credit through the combination of an emerging asset bubble, simple greed, the advent of securitization, and an eagerness to find toehold ways to fund equity transactions, a signal that the wall between commercial and investment banks erected by the Depression-era Glass-Steagall Act was beginning to break down.

4. Eric J. Weiner, *What Goes Up: The Uncensored History of Modern Wall Street as Told by the Bankers, Brokers, CEOs, and Scoundrels Who Made It Happen.* New York: Little, Brown, 2005.

5. They started out as investment-grade bonds, but when their issuers cratered, the bonds became so cheap that they paid a higher rate; e.g., a bond that yielded 7% would yield 10% if the price of the bond dropped to 70% of par.

6. See Connie Bruck, *The Predators' Ball: The Inside Story of Drexel Burnham and the Rise of the Junk Bond Raiders.* New York: The American Lawyer: Simon & Schuster, 1988.

7. Typically the deals worked either by giving shareholders who sold a higher price but leaving a much weakened company for those who didn't, or by offering a premium that was only a fraction of the value the buyer would create through actions the former management should have taken themselves. Or both.

8. Leonard Goldenson with Marvin J. Wolf, *Beating the Odds.* New York: Charles Scribner's Sons, 1991.

9. Everyone from Saul Steinberg to Larry Tisch had taken a stake in the company. Meanwhile, management's first-choice buyer was IBM. In the end, Cap Cities proved a strong fit because of the complementary TV license and the minimum divestiture required.

10. Interview with Tom Murphy.

11. Ibid. Details are also recounted in Leonard Goldenson with Marvin J. Wolf, *Beating the Odds.*

12. Buffett paid sixteen times earnings for Cap Cities, a 60% premium to its recent price, and, on banker Bruce Wasserstein's insistence, threw in warrants that gave the seller a continuing equity stake in ABC. These terms, arguably, are the most lenient Buffett ever struck and suggest how badly he and Murphy wanted to buy ABC. Charlie Munger wrote to the Buffett Group on January 11, 1983, that Tom Murphy at Cap Cities had "compounded the value of his original 1958 investment at 23% per annum for 25 years." Donaldson, Lufkin & Jenrette report February 26, 1980: "Earnings per share growth has compounded at 20% annually over the past decade and this rate has accelerated to 27% over the last five years."

13. Geraldine Fabrikant, "Not Ready for Prime Time?" *New York Times,* April 12, 1987.

14. Murphy and his #2, Dan Burke, picked and chose to make divestitures required by the FCC. They kept eight TV, five AM radio, and five FM radio stations. Geraldine Fabrikant, Marc Frons, Mark N. Vamos, Elizabeth Ehrlich, John Wilke, Dave Griffiths, and Christopher S. Eklund, "A Star Is Born—the ABC/Cap Cities Merger Opens the Door to More Media Takeovers," *BusinessWeek,* April 1, 1985; Richard Stevenson, "Merger Forcing Station Sales," *New York Times,* April 1, 1985.

15. With 1984 sales of $3.7 billion, ABC earned $195 million, whereas Cap Cities, one third its size, earned $135 million on sales of $940 million. The disparity in profitability was mainly due to the different economics of network affiliate stations versus the network itself but also to Murphy and Burke's management skills.

16. According to "Extortion Charge Thrown Out; Judge Cancels $75,000 Bond," *Omaha World-Herald,* March 19, 1987, charges against Robert J. Cohen were dismissed after the case was referred to the Douglas County Board of Mental Health and Cohen was moved to the Douglas County Hospital from the Douglas County Corrections Center. Terry Hyland, in "Bail Set at $25,000 for Man in Omaha Extortion Case," *Omaha World-Herald,* February 5, 1987, refers to the kidnapping plan.

17. Interview with Gladys Kaiser.

18. Ibid.

19. Based on examples of actual letters received.

20. Interview with Gladys Kaiser.

21. Interviews with Howie Buffett, Peter Buffett, Susie Buffett Jr.

22. Interview with Susie Buffett Jr.

23. Alan Farnham, "The Children of the Rich and Famous," *Fortune,* September 10, 1990.

24. Interview with Howie Buffett.

25. Interview with Peter Buffett.

26. Billy Rogers letter to Warren Buffett, August 17, 1986.

27. Warren Buffett letter to Billy Rogers, August 22, 1986.

28. Billy Rogers letter to Warren Buffett, undated.

29. Interviews with Tom Newman, Kathleen Cole.

30. Richard I. Kirkland Jr., "Should You Leave It All to the Children?" *Fortune,* September 29, 1986.

31. Interview with Kathleen Cole.

32. Interview with Ron Parks.

33. Interview with Peter Buffett. He was so shaken that he dialed "0" instead of "911," as if taken back to childhood.

34. "Billy Rogers Died of Drug Overdose," *Omaha World-Herald,* April 2, 1987; "Cause Is Sought in Death of Jazz Guitarist Rogers," *Omaha World-Herald,* February 21, 1987.

35. Interview with Arjay Miller.

36. Interviews with Verne McKenzie, Malcolm "Kim" Chace III, Don Wurster, Dick and Mary Holland.

37. Interview with George Brumley.

38. Louis Jean-Baptiste Alphonse Bachelier, *Theory of Speculation,* 1900. Bachelier applied the scientific theory of "Brownian motion" to the market, probably the first of many attempts to bring the rigor and prestige of hard science to the soft science of economics.

39. Charles Ellis, *Investment Policy: How to Win the Loser's Game.* Illinois: Dow-Jones-Irwin, 1985, which is based on his article "Winning the Loser's Game" in the July/August 1975 issue of the *Financial Analysts Journal.*

40. The modern-day equivalents of Tweedy Browne's Jamaica Water warrants still exist, for example.

41. Burton Malkiel, *A Random Walk Down Wall Street.* New York: W. W. Norton, 1973.

42. Aside from the *Superinvestors* article, Buffett did not write about EMH directly until the Berkshire 1987 shareholders letter, but he had led up to it with related subjects such as excessive trading turnover since 1979.

43. Transcript of Graham and Dodd 50th Anniversary Seminar. Jensen at the time was professor and director of the Managerial Economics Research Center of the University of Rochester Graduate School of Management. Within a year, he would be at Harvard, where he remains as professor of business administration emeritus.

44. Stanley Perlmeter and the *Washington Post* pension fund. Although, as this book illustrates, Buffett shared ideas with some of these investors in the early days—for example, when he was short on capital—more often the use of similar rules led them to similar veins of ore.

45. One subtle underpinning of EMH was a free-market, quasilibertarian philosophy that aligned with the spirit of deregulation and Reaganomics, under which investors could fend for themselves as free agents in an unfettered self-regulating market. Thus one side effect of EMH was to subtly build support for other types of market deregulation and for government and Federal Reserve actions that arguably contributed to later asset bubbles.

46. Beta can be a godsend in helping manage an unmanageably large portfolio. Criticism of beta could also, therefore, be directed at the investors who put money into unmanageably large funds that are diversified this way, and then expect them to outperform the market every year, if not every quarter.

47. Hedge funds in this form, pioneered by A. W. Jones, preceded popularization of the random-walk academic theory.

48. In a worst-case scenario, both sides of an arbitrage go the wrong way—the short rises, the long falls. This is the "earthquake risk" of the arbitrageur.

49. Buffett, speaking at the 1994 Berkshire annual shareholder meeting. Munger made the "twaddle and bullshit" comment at the 2001 shareholder meeting.

50. The model with junk bonds was based on average credit history, not the behavior of the stock or bond market. The two models are not only related, but have the same basic flaw, which is that "earthquake events" are never factored in correctly—because if they were, the model would reveal a prohibitively high cost of capital.

51. With the introduction of equity index futures in 1982, Buffett started trading these instruments as a hedge. Nevertheless, he wrote Congressman John Dingell, chairman of the House Energy and Commerce Committee, warning about their risk, and likewise wrote to Don Graham, "So much for the many claims as to hedge and investment type utilization; in actual practice, virtually all contracts involve short-term highly leveraged gambling—with the brokers taking a bite out of every dollar of public participation." Letter from Warren Buffett to Mr. and Mrs. Don Graham, January 18, 1983.

52. Berkshire Hathaway annual letter, 1985. The deal was $320 million in cash and the rest in assumed debt and other costs. "Scott Fetzer Holders Clear Sale of Company," *Wall Street Journal,* December 30, 1985. In Berkshire's 2000 annual report, Buffett points out that BRK netted $1.03 billion from its net purchase price of $230 million.

53. Interview with Jamie Dimon.

54. Berkshire had $4.44 billion of assets on its books at the end of 1986, including $1.2 billion of unrealized gains on equities. Liquidating before the reform, Berkshire itself could have avoided paying any taxes, with the shareholders paying their 20% tax on the gain, or $244 million. If BRK liquidated after the Tax Reform Act took effect, Berkshire would be paying $414 million in corporate taxes (more than $185 million of which would have accrued to Buffett), before handing over the net proceeds to investors to pay a double tax, adding up to a maximum of a 52.5% tax on the $1.2 billion unrealized appreciation, or $640 million. Thus the total effect was $400 million. See also James D. Gwartney and Randall G. Holcombe, "Optimal Capital Gains Tax Policy: Lessons from the 1970s, 1980s, and 1990s," A Joint Economic Committee Study, United States Congress, June 1997.

55. Berkshire Hathaway annual report, 1986. Notably, Buffett phrases the statement in terms of the costly consequences if Berkshire liquidated after the act, not the huge benefits that would have resulted from liquidating before the act went into effect.

56. This measuring stick has pros and cons, which are covered in investing books. Bottom line, it is a reasonable, conservative measure that can be distorted by acquisitions (something Buffett had discussed; see General Re).

57. Interviews with Walter Scott Jr., Suzanne Scott; also Jonathan R. Laing, "The Other Man From Omaha," *Barron's,* June 17, 1995.

58. Interview with Walter Scott Jr.

59. Interview with Clyde Reighard.

60. Jerry Bowyer, in *National Review,* August 11, 2006, wrote that Reagan's "supply-side policies have helped Warren Buffet [sic] amass the world's second-largest pile of wealth, which he routinely uses as a stage on which to stand and denounce the very supply-side measures that helped lift him to incredible prosperity." It is true that like any investor, Buffett has benefited from the supply-side policies that reduce his personal taxes on investment income and capital gains. Notably, much of that benefit is effectively offset by Berkshire Hathaway's taxes. Since the Reagan years, Citizens for Tax Justice and the Institute on Taxation and Economic Policy have been studying the annual reports of the top 250+ companies in the U.S., always coming to the conclusion that they are severely underpaying. See Robert S. McIntyre and T. D. Coo Nguyen, *Corporate Taxes & Corporate Freeloaders* (August 1985), *Corporate Income Taxes in the 1990s* (October

2000), *Corporate Income Taxes in the Bush Years* (September 2004). The top 250 companies in the U.S., while growing profits substantially, have consistently been shown to pay a fraction of the actual corporate tax rate throughout the 1980s, '90s, and today, due to breaks for depreciation, stock options, research, etc. Berkshire, however, has averaged a 30% effective tax rate (net earnings before taxes, divided by the taxes paid currently) since 1986—offsetting Buffett's personal tax benefits. Regardless, Buffett's taxes are irrelevant to whether he is entitled to criticize supply-side policies.

61. Robert Sobel, *Salomon Brothers 1910–1985, Advancing to Leadership,* Salomon Brothers, Inc., 1986.

62. In other words, current partners were paid a premium above their invested capital by Phibro, in which retired partners who had already withdrawn their capital did not share.

63. Anthony Bianco, "The King of Wall Street—How Salomon Brothers Rose to the Top—And How It Wields Its Power," *BusinessWeek,* December 5, 1985.

66. Paul Keers, "The Last Waltz: He had the power, she craved the position. Life was a ball until he had to resign in disgrace and an era ended," *Toronto Star,* September 1, 1991.

67. Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996, who did not identify the executive giving this description.

68. Paul Keers, "The Last Waltz" Carol Vogel, "Susan Gutfreund: High Finances, High Living," *New York Times,* January 10, 1988; David Michaels, "The Nutcracker Suit," *Manhattan, Inc.,* December 1984; John Taylor, "Hard to Be Rich: The Rise and Wobble of the Gutfreunds," *New York,* January 11, 1988.

69. As Mrs. Bavardage.

70. Paul Keers, "The Last Waltz" Cathy Horyn, "The Rise and Fall of John Gutfreund; For the Salomon Bros. Ex-Head, a High Profile at Work & Play," *Washington Post,* August 19, 1991.

71. Robert Sobel, *Salomon Brothers 1910–1985, Advancing to Leadership.*

72. The combative, powerful banker Bruce Wasserstein, a merger specialist, was supposedly going to run the firm. Gutfreund and his key lieutenants knew they would be instantly replaced by Wasserstein. And Perelman as the largest shareholder might scare clients away.

73. Salomon bought the Minorco block itself at $38, a 19% premium to the stock's $32 market price. It then offered Buffett the stock at the same price. The premium was typical for similar deals at the time (which were also criticized). The stock conveyed 12% voting power in the firm. Perelman offered $42 and said he might raise his stake to 25%.

74. Salomon made a number of missteps. It took on a buyout of TVX Broadcast Group that ultimately failed, muffed a leveraged buyout of Southland Corporation, and wound up holding the bag on a problematic Grand Union buyout. After five unsuccessful years, Salomon exited the merchant-banking business in 1992.

75. Sarah Bartlett, "Salomon's Risky New Frontier," *New York Times,* March 7, 1989.

76. Buffett viewed his investment in Salomon as being like a bond. If he had wonderful stock ideas like GEICO or American Express, he would not be looking at bond equivalents and would not have done this deal.

77. Interview with John Gutfreund.

78. Interviews with John Gutfreund, Donald Feuerstein. Feuerstein's son went to school with one of Perelman's children. He knew Perelman was observant and parlayed for a critical delay past the holiday.

79. According to Graham and Dodd, preferred stocks marry the least attractive features of equity and debt. "As a class," they wrote, "preferred shares are distinctly more vulnerable to adverse developments than are bonds." Benjamin Graham and David L. Dodd, *Security Analysis, Principles and Teaching.* New York: McGraw-Hill, 1934, Chapter 26. Preferreds are often described as "bonds with a kicker," combining the safety of a bond with the upside of a stock. However, as Graham and Dodd note, this is not really correct. If a company gets in trouble, preferreds lack an enforceable claim to the interest and principal. When things go well, unlike a common stock, the investor has no right to the company's profits. Speaking at the University of Florida in 1998, Buffett said, *"The test of a senior security is whether you are getting an above-average return, after tax, and feel certain of getting your principal back."* Here, the preference to the common was meaningless.

80. Beginning October 31, 1995, in five installments over four years, it was mandatory to either convert into Salomon stock or "put" it back to the company for cash. Perelman offered to beat Buffett's deal—and Gutfreund and several other managers told the board they would quit. He offered a conversion price of $42, much more attractive from Salomon's point of view. He would have owned only 10.9% of Salomon, compared to Buffett's 12%.

81. If a potential buyer for his block of convertible preferred appeared, Buffett was obliged to offer Salomon first refusal. Even if it did not buy back the shares, he was prohibited from selling his entire block to any one purchaser. Berkshire also agreed to limit its investment in Salomon to no more than 20% for seven years.

82. Michael Lewis, *Liar's Poker: Rising Through the Wreckage on Wall Street.* New York: W. W. Norton, 1989.

83. Interview with Paula Orlowski Blair.

Chapter 47

1. Berkshire Hathaway letter to shareholders, 1990; Michael Lewis, "The Temptation of St. Warren," *New Republic,* February 17, 1992.

2. At the University of Notre Dame, spring 1991. Cited in Linda Grant, "The $4-Billion Regular Guy: Junk Bonds, No. Greenmail, Never. Warren Buffett Invests Money the Old-Fashioned Way," *Los Angeles Times,* April 7, 1991.

3. In "How to Tame the Casino Economy," *Washington Post,* December 7, 1986, Buffett advocated a 100% confiscatory tax on profits from the sale of stocks or derivative instruments that the holder has owned for less than a year.

4. Linda Grant, "The $4-Billion Regular Guy." Buffett hosannaed Gutfreund in his shareholder letters as well.

5. The principal conflicts inherent in Salomon's business were the undisclosed bid-ask spread that Buffett had objected to while working for his father's firm in Omaha, the conflict between proprietary trades for the firm's account alongside customer trades, the investment banking business built off equity research stock ratings, and the arbitrage department, which could trade on the firm's merger deals. As a board member who made Berkshire's investment decisions, Buffett says he either recused himself from discussions involving deals or did not invest on information he had, yet his board membership did create the appearance of a conflict of interest.

6. The Standard & Poor's 500 index was used as a proxy for the market.

7. Bertie would never make this bet. Since childhood, Warren had beaten her at every game they ever played; never once had he let her win. She would have known that he would eat a potato chip just so she would have had to pay up.

8. Letter from Warren E. Buffett to the Honorable John Dingell, U.S. House of Representatives, March 5, 1982.

9. In the interest of brevity, the history of portfolio insurance has been shortened considerably. The rout began as the Federal Reserve raised the discount rate over Labor Day weekend 1987. Over the next month, the market wavered and showed signs that investors were nervous. On October 6, the Dow broke a one-day record when it fell 91.55 points. Interest rates continued to climb. The Dow dropped another 108 points on Friday, October 16. Professional money managers spent the weekend pondering. On Black Monday, October 19, many stocks failed to open at all in the early hours of trading and the Dow fell a record-breaking 508 points. The exact cause of the crash remains in dispute. Program trading and equity index futures accelerated the decline, but economic factors, military tensions, comments by Federal Reserve Chairman Alan Greenspan about the dollar, a slowing economy, and other factors have been blamed.

10. Interviews with Ed Anderson, Bill and Ruth Scott, Marshall Weinberg, Fred Stanback, Tom Knapp.

11. Interview with Walter Scott Jr.

12. In this case, the way to be hedged would be to short a broad group or index of stocks.

13. This account is based on both Doris's and Warren's versions of the story.

14. James Sterngold, "Too Far, Too Fast: Salomon Brothers' John Gutfreund," *New York Times,* January 10, 1988.

15. Salomon supplied its clients' debt needs along all points of the maturity ladder. For a bond shop to eliminate its commercial paper department was a baffling decision.

16. Four past option grants to Gutfreund were about to expire worthless and a fifth would have yielded only a trivial gain. The revised exercise price reaped Gutfreund an estimated $3 million. The impact of swapping all stock options for new options affected 2.9% of outstanding shares. Salomon's 1987 proxy did not disclose the repricing and instead contained an additional $4.5 million or 3.4% stock-option grant (Graef Crystal, "The Bad Seed," *Financial World,* October 15, 1991).

17. Interview with Bob Zeller.

18. Ibid. Zeller says that Buffett represented the shareholders' interests on the compensation committee with integrity, while trying to determine which employees genuinely deserved reward.

19. John Taylor, "Hard to Be Rich: The Rise and Wobble of the Gutfreunds," *New York,* January 11, 1988.

20. Interviews with John Gutfreund, Gedale Horowitz.

21. Interview with Tom Strauss.

22. While technically the terms of the preferred stock didn't work that way, if Buffett wanted to, he could have found a way to get out.

23. Carol Loomis, "The Inside Story of Warren Buffett," *Fortune,* April 11, 1988. Buffett stated these rumors were false in the article.

24. Katharine Graham letter to the members of the Buffett Group, December 14, 1987. She added a personal note to Warren's copy: "Here is what I sent out. Hope it is ok and I don't get lynched."

25. Investors use different periods to estimate cash flows—from ten years to forever ("perpetuity")—as well as different interest rates. Buffett's margin of safety, however, was big enough to essentially eliminate the differences in methods; his view was that debating such precision mattered less than applying a big haircut. The key assumption is what growth rate the business is assumed to have—and for how long.

26. Robert L. Rose, "We Should All Have an Audience This Receptive Once in Our Lives," *Wall Street Journal,* May 25, 1988.

27. Or 14,172,500 KO shares costing $593 million at an average price of $41.81 (or $5.23 split adjusted for the three 2-for-1 stock splits that occurred between 1988 and 2007). All shares and prices are adjusted for subsequent stock splits.

28. Interview with Walter Schloss.

29. At that point, KO's market value represented 21% of the total market capitalization of Berkshire Hathaway—by far the biggest bet, in dollar terms, that Buffett had ever made on a single stock. Yet in percentage terms, this fit his past pattern.

30. Interview with Howie Buffett.

31. Michael Lewis, *Liar's Poker: Rising Through the Wreckage on Wall Street.* New York: W. W. Norton, 1989.

32. BRK received a 9.25% coupon from the Champion preferred, above the going rate of 7%, and raised debt at 5.5% to fund this $300 million purchase. Champion called the preferred early, but Berkshire was able to convert its shares prior to the call and sell them back to the company at a small discount. Berkshire booked a 19% after-tax capital gain over the six years it held Champion.

33. Linda Sandler, "Heard on the Street: Buffett's Special Role Lands Him Deals Other Holders Can't Get," *Wall Street Journal,* August 14, 1989.

34. From an interview with a friend who said this to Munger.

35. Speech at Terry College of Business, the University of Georgia, July 2001.

36. Interview with John Macfarlane.

37. Interview with Paula Orlowski Blair; Michael Lewis, *Liar's Poker.*

38. Many contracts required posting of collateral or margin, but this did not compensate for the risk of mismarking in the model.

39. Buffett and Munger, 1999 Berkshire Hathaway annual shareholder meeting.

40. Salomon held on for eight years. Phibro sold its share in the JV in 1998. Alan A. Block, "Reflections on resource expropriation and capital flight in the Confederation," *Crime, Law and Social Change,* October 2003.

41. Roger Lowenstein, *When Genius Failed: The Rise and Fall of Long-Term Capital Management.* New York: Random House, 2000.

42. Interview with Eric Rosenfeld.

43. Meriwether characteristically exempted himself from this lucrative deal.

44. Report to the Salomon Inc. Compensation & Employee Benefits Committee, "Securities Segment Proposed 1990, Compensation for Current Managing Directors."

45. This pay deal was still one-sided; the arbs could only break even or win. Buffett's partnership had exposed him to unlimited liability to share in losses if he performed poorly—i.e., his incentives were *truly* aligned with his partners.

46. Michael Siconolfi, "These Days, Biggest Paychecks on Wall Street Don't Go to Chiefs," *Wall Street Journal,* March 26, 1991.

47. Interview with Deryck Maughan.

48. Using different terms. The casino/restaurant analogy was Buffett's. Even if the customer businesses had become profitable, they would have demanded even larger amounts of capital in later years, despite bigger scale and market share, and it is questionable whether their returns would ever have satisfied Buffett.

49. Interview with Eric Rosenfeld.

Chapter 48

1. Michael Lewis, *Liar's Poker: Rising Through the Wreckage on Wall Street.* New York: W. W. Norton, 1989.

2. Feuerstein had worked in several senior roles at the SEC, including acting as counsel on Texas Gulf Sulfur, a landmark insider-trading case.

3. Interview with Donald Feuerstein and many others, who confirmed his role and the POD nickname.

4. Interviews with Donald Feuerstein, Tom Strauss, Deryck Maughan, Bill McIntosh, John Macfarlane, Zach Snow, Eric Rosenfeld.

5. Interview with Bill McIntosh.

6. Interview with John Macfarlane.

7. Roger Lowenstein, *Buffett: The Making of an American Capitalist.* New York: Doubleday, 1996, quoting Eric Rosenfeld.

8. Lowenstein, *Buffett,* quoting John McDonough.

9. Interview with Eric Rosenfeld.

10. Interview with Donald Feuerstein.

11. Feuerstein went back into the conference room after talking to Munger and repeated the "thumb-sucking" comment to another lawyer, Zach Snow, without further context. He did not seem to have grasped its significance, according to Snow in an interview. Feuerstein says Munger said, "Warren and I do that all the time." Whatever the wording, neither Feuerstein nor Buffett took alarm at Munger's remark.

12. Interview with Gerald Corrigan.

13. Feuerstein had had breakfast with one director, Gedale Horowitz, and told him much the same story, slightly more informatively, on the morning of August 8. But Horowitz says he also felt misled.

14. Carol Loomis, "Warren Buffett's Wild Ride at Salomon," *Fortune,* October 27, 1997.

15. Munger's later statement that he dragged this out of Feuerstein differs from Feuerstein's recollection. Both agree that Munger was given a clear description. There is no question that Buffett and Munger's overall interpretation of the actions of both Feuerstein and Gutfreund grew harsher as more information came to light.

16. Statement of Salomon Inc., submitted in conjunction with the Testimony of Warren E. Buffett, Chairman and CEO of Salomon, before the Securities Subcommittee, Committee of Banking, Housing and Urban Affairs, U.S. Senate, September 10, 1991.

17. Mercury Asset Management (an affiliate of S.G. Warburg) and the Quantum Fund. When the Federal Reserve contacted Salomon, it was initially because S.G. Warburg had bid in its own name as a primary dealer (Statement of Salomon Inc., September 10, 1991).

18. Charles T. Munger testimony before U.S. Securities & Exchange Commission, "In the Matter of Certain Treasury Notes and Other Government Securities," File No. HO-2513, February 6, 1992.

19. Ibid.

20. Michael Siconolfi, Constance Mitchell, Tom Herman, Michael R. Sesit, David Wessel, "The Big Squeeze: Salomon's Admission of T-Note Infractions Gives Market a Jolt—Firm's Share of One Auction May Have Reached 85%; Investigations Under Way—How Much Did Bosses Know?" *Wall Street Journal,* August 12, 1991.

21. Buffett later said Wachtell, Lipton shared some blame, noting that Wachtell declared effective on August 8 a shelf registration for $5 billion of medium-term notes using a prospectus that was "purporting to state all material facts about Salomon" as of that date but contained no reference to Mozer's activities or management's inaction. *"If this relaxed position was one that Wachtell, Lipton was conveying to the government and the public through official filings, it is not unlikely that they were conveying something similar to John, although I don't know what,"* Buffett said.

22. Interview with John Macfarlane.

23. Interview with Bob Denham, who discovered this when he moved into Feuerstein's old office.

24. Charles T. Munger testimony before U.S. Securities & Exchange Commission, "In the Matter of Certain Treasury Notes and Other Government Securities," File No. HO-2513, February 6, 1992.

25. If its lenders failed to renew the firm's loans, Salomon would be forced to liquidate its assets almost overnight. In such a fire sale, assets would sell for a fraction of their carrying value. The apparently invincible balance sheet of Salomon would melt into bankruptcy's black hole immediately.

26. Interview with Bill McIntosh.

27. Interviews with Donald Feuerstein, John Macfarlane.

28. Mozer didn't report an existing net "long," "when-issued" position in Treasury bonds that put it over the limit, and he also submitted another false bid in the name of Tiger Management Company.

29. Mozer denied intentionally manipulating the market. He was suspected of "repo-ing out" the bonds by borrowing cash from customers with the bonds as collateral and making verbal side agreements with these customers that they would not relend the bonds to anyone. That froze the supply of bonds, squeezing the short-sellers. Suspicions of price-fixing dogged Salomon long afterward. There was little doubt that Mozer and his customers had cornered the bonds and created a squeeze. According to Eric Rosenfeld, Salomon's own arb desk was short Treasuries and got burned.

30. Constance Mitchell, "Market Mayhem: Salomon's 'Squeeze' in May Auction Left Many Players Reeling—In St. Louis, One Bond Arb Saw $400,000 Vanish and His Job Go with It—From Confidence to Panic," *Wall Street Journal,* October 31, 1991.

31. Feuerstein didn't find this out right away, even though it was known internally. He blames this omission for his failure to press for a more thorough investigation of the squeeze. Several people, including Meriwether, apparently knew about the "Tiger dinner" (named after one of the hedge-fund customers). However, the "Tiger dinner" did not prove collusion.

32. Interview with John Gutfreund.

33. Or whatever the price was; this is Buffett's general recollection.

34. While this was taking place, Salomon filed a shelf registration statement in connection with a $5 billion senior debt offering, which the directors signed. The filing of a registration statement under these circumstances potentially put the firm in violation of securities laws.

35. Some thought the squeeze may have been simply a matter of timing to make a bet that the Fed was about to ease interest rates, according to Eric Rosenfeld, rather than defiance of the Treasury.

36. Various viewpoints within the firm are drawn from interviews with a number of the principals.

37. Interviews with Donald Feuerstein, Zachary Snow. Feuerstein says he happened to be taking his son on a college visit at Cornell University that day and was "furious" when he found out later what happened.

38. Interview with Donald Feuerstein. Feuerstein referred to his failure to influence Gutfreund as the result of Gutfreund's yessing him to death, saying, "It is difficult to have an argument with someone who purports to agree with you" (Donald M. Feuerstein letter to William F. May, Charles T. Munger, Robert G. Zeller, and Simon M. Lorne, Munger, Tolles & Olson, January 31, 1993).

39. Interview with Zach Snow. Snow says that the dream haunted him long afterward. Feuerstein does not recall this incident but says that if something like this happened it did not come across this way to him.

40. Philip Howard, Gutfreund's lawyer, speaking to Ron Insana on CNBC *Inside Opinion,* April 20, 1995.

41. John Gutfreund speaking to Ron Insana, CNBC *Inside Opinion,* April 20, 1995.

42. The auctions of December 27, 1990 (4-year notes), February 7, 1991 (the so-called "billion-dollar practical joke"), and February 21, 1991 (5-year notes) contained false bids. The April 25, 1991, auction included a bid in excess of the amount authorized by a customer. In the May 22, 1991 (2-year-notes) auction, Salomon (Mozer) failed to report a net "long" position to the government, as required, which fueled suspicions of a cover-up of market manipulation, but proof of market manipulation was never found.

43. Interview with Zach Snow, who also testified to this under oath in 1994.

44. Interview with Deryck Maughan.

45. Interview with Jerry Corrigan.

46. Even though he was Mozer's boss, Meriwether did not have the authority to fire him; one managing director could not fire another. Only Gutfreund could do that.

47. Interview with Bill McIntosh.

48. Interviews with John Macfarlane, Deryck Maughan.

49. McIntosh, by his own admission, had been no fan of Gutfreund's prior to this event.

50. Interview with Bill McIntosh.

51. Spread-widening of ten to twenty basis points only attracted more sellers. As the afternoon wore on, the traders widened the spread until finally they were offering only ninety cents on the dollar for the notes. The price implied a reasonably high probability of default.

52. The firm would still do business as an "agent," which meant it would buy only if it had another buyer in hand to which it could resell the notes.

53. Kurt Eichenwald, "Wall Street Sees a Serious Threat to Salomon Bros.—ILLEGAL BIDDING FALLOUT—High-Level Resignations and Client Defections Feared—Firm's Stock Drops," *New York Times,* August 16, 1991.

54. Interview with Jerry Corrigan.

55. Strauss later related this to Buffett.

56. Interview with Jerry Corrigan.

57. Interview with Jerry Corrigan.

58. Interview with Jerry Corrigan. He says that Strauss and Gutfreund had had more than one routine conversation with him between April and June without mentioning anything, and he no longer trusted them.

59. Buffett arrived in New York between 2:30 and 3:00 p.m., during which time the press release would have been drafted and ready to go.

60. From Salomon press release dated August 16, 1991: "In order to give the Salomon Inc., board of directors maximum flexibility, they are prepared to submit their resignations at a special meeting of the board."

61. Interview with Eric Rosenfeld.

62. Interview with Bill McIntosh, Tom Strauss, Deryck Maughan.

63. Interview with Tom Strauss.

64. Interview with Jerry Corrigan.

65. Interview with Ron Olson.

66. Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc." Sessions 13 & 14, November 29, 1993.

67. This is Buffett's recollection of Gutfreund's remarks. (From Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, November 29, 1993.

68. Interview with Tom Strauss.

69. On October 8, 1991, he was displaced when the Walton family, owners of Wal-Mart stock, took over spots 3-7; Buffett became number 8. Entertainment mogul John Kluge and Bill Gates occupied the top two spots.

70. Through a routine letter to Mercury Asset Management when the Treasury Department discovered that Mercury, together with its affiliate S. G. Warburg & Co., had submitted bids for greater than the 35% limit rule for the auction. Mozer had submitted one of these bids without Mercury's authority. Mozer was copied on this letter and covered it up by telling Mercury that Salomon had mistakenly submitted this bid in its name—and was going to correct it, so no need to bother responding to the Treasury. (Statement of Salomon Inc., submitted in conjunction with the Testimony of Warren E. Buffett, Chairman and CEO of Salomon. Before the Securities Subcommittee, Committee of Banking, Housing and Urban Affairs, U.S. Senate, September 10, 1991.)

71. Interview with Deryck Maughan.

72. Speech to students in 1994 at University of North Carolina Kenan-Flagler Business School.

73. The one exception was Stanley Shopkorn, who ran the equities division and, by others' recollections, thought he should get the job.

74. Michael Lewis, *Liar's Poker*.

75. Ibid.

76. Swope fired them all and turned the firm into a radical Black Power, "Truth & Soul" agency.

77. Interview with Deryck Maughan.

78. Interview with Eric Rosenfeld, who says no threats were made. But because Meriwether was not bound by a noncompete, it was obvious that the whole arb team would leave sooner or later.

79. Gutfreund told Buffett that Susan was telling him he was unemployable.

80. Interview with Philip Howard. Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, November 29, 1993.

81. Interview with Warren Buffett; Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, November 29, 1993, cited this remark as evidence that Gutfreund knew he did not have a deal. (Munger's version of the quote was "I won't let you guys screw me.")

82. Interview with Philip Howard.

83. Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14.

84. Warren Buffett, Charles T. Munger, testimonies, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, 33 & 34.

85. Charles T. Munger testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 33 & 34, December 22, 1993.

86. Interview with Gedale Horowitz.

87. The Japanese bond market would not open until 7:30 P.M. EST, but Japanese over-the-counter trading would begin as early as 5 P.M., at which point lenders would start selling Salomon's paper, effectively calling its loans.

88. Interview with John Macfarlane.

89. Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, November 29, 1993.

90. Interview with Jerry Corrigan.

91. Jerry Corrigan and Paul Volcker contributed insight to this topic.

92. At the time, it was well understood that Buffett had "parlayed his considerable reputation into a partial rescission of the order," although what that meant to him was not obvious. (Saul Hansell, Beth Selby, Henny Sender, "Who Should Run Salomon Brothers?" *Institutional Investor,* Vol. 25, No. 10, September 1, 1991.)

93. Interview with Deryck Maughan.

94. Interview with Charlie Munger.

95. Interview with Deryck Maughan.

96. Hansell, Selby, and Sender, "Who Should Run Salomon?"

97. Ibid.

Chapter 49

1. Interview with Paula Orlowski Blair.

2. Interview with Bill McLucas.

3. This is Buffett's recollection of the quote, but Brady's view that Buffett would not leave was corroborated by other regulators.

4. Interview with Paula Orlowski Blair. She thought it funny that her new boss wanted to turn her into a private eye.

5. Interviews with Donald Feuerstein, Bob Denham. Denham says only that they agreed a change was needed.

6. Warren Buffett testified to this in "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 & 14, November 29, 1993.

7. During John Gutfreund's arbitration hearing.

8. A number of sources said this to the author but were afraid to be quoted.

9. The firm became Munger, Tolles & Olson in 1986.

10. Law-firm sources and former employees give Buffett all of the credit for this idea, despite the law firm's putative role.

11. Drexel Burnham Lambert had failed after its indictment. Kidder, Peabody was sold to PaineWebber. Salomon's highly leveraged balance sheet put the firm in even greater jeopardy.

12. Interview with Ron Olson.

13. Ibid.

14. Ibid.

15. Interview with Frank Barron. Rudolph Giuliani, U.S. Attorney for the Southern District of New York, had pressed for Drexel Burnham Lambert to waive the privilege, but the firm did not.

16. Charlie Munger later acknowledged the morally fraught—at best, ambiguous—situation, saying he and Buffett had no choice but to assist in criminal investigation and prosecution of potentially innocent employees. "When the final chapter is written, the behavior evinced by Salomon will be followed in other, similar cases," he said. "People will be smart enough to realize this is the response we want—super-prompt—even if it means cashiering some people who may not deserve it." Lawrie P. Cohen, "Buffett Shows Tough Side to Salomon and Gutfreund," *Wall Street Journal,* November 8, 1991.

17. Warren Buffett letter to Norman Pearlstine, November 18, 1991.

18. Buffett testified to this in "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc.," Sessions 13 and 14, November 29, 1993.

19. "I didn't fire them on the spot," said Olson in an interview. "I was a little more subtle than that."

20. Interviews with Carolyn Smith, Warren Buffett. He added Smith to his collection of people, writing to the head of the hotel about her, corresponding with her, and putting her on his Christmas list.

21. Interviews with Gladys Kaiser and Bob Denham.

22. House Committee on Energy and Commerce—Telecommunications & Finance Subcommittee, September 4, 1991, regarding securities trading violations by Salomon Brothers and implications for government securities market reform legislation.

23. Maughan had to go back to Washington a few weeks later to testify by himself. "The sea did not part," he says, "and I got thoroughly wet."

24. "Our goal is going to be that stated many decades ago by J. P. Morgan, who wished to see his bank transact 'first-class business in a first-class way.'" Warren Buffett, "SALOMON INC—A report by the Chairman on the Company's Position and Outlook."(This wording was also used in a letter to Salomon Inc., shareholders as reprinted in the *Wall Street Journal,* November 1, 1991.)

25. Senate Subcommittee on Securities Committee on Banking, Housing, and Urban Affairs—Hearing on the Activities of Salomon Brothers Inc., in Treasury Bond Activities, Wednesday, September 11, 1991.

26. At the time, sixty-five lenders had stopped entering into repurchase agreements with Salomon, and the firm's commercial-paper balance was falling toward zero. One major counterparty, Security Pacific, was refusing to do daylight foreign-exchange trades without posting of collateral. Buffett says this was his absolute low point. The news media never picked up this story, which, if reported, could have kicked off a panic.

27. Interview with John Macfarlane. The cost of funds motivated traders to run off uneconomic trades. Ultimately the rate went to 400 basis points over Fed Funds rate. The short-term capital-intensive trades like the "carry-trade" (interest arbitrage) ran off.

28. Interview with John Macfarlane.

29. Senate Subcommittee on Securities Committee on Banking, Housing, and Urban Affairs—Hearing on the Activities of Salomon Brothers, Inc., in Treasury Bond Activities, Wednesday, September 11, 1991.

30. By then, many other people, including Denham and Munger, had found out about the Sternlight letter, but they say everybody thought somebody else had told Buffett or that he somehow knew. Buffett and Munger were also incensed to learn that at the June audit committee meeting, with Feuerstein present, Arthur

Andersen represented that no events had taken place that were required to be reported to the SEC or the New York Stock Exchange. While Wachtell, Lipton had indeed taken that position, this statement, with hindsight, was manifestly untrue.

31. Employees asked how much Buffett and Munger understood about the workings of Salomon before August 1991, while serving on the board, uniformly said "not much," or words to that effect, and that information was skillfully meted out to the board so that much of the firm's messiness never surfaced.

32. Lawrie P. Cohen, "Buffett Shows Tough Side to Salomon."

33. Interview with Gladys Kaiser.

34. Buffett cannot remember who did this—although it was neither Astrid, who retires early, nor someone from the office. He thinks it must have been some other local friend or neighbor.

35. Although securities underwriters sell service, price, and expertise, ultimately they are financial guarantors. Salomon's financial-strength ratings had been downgraded. With a criminal indictment and its primary dealership threatened, that the firm managed to retain any banking clients remains one of Wall Street's great survival stories. It did so by giving up lead positions and switching to co-lead, in effect taking on a supporting-cast-member role. Nevertheless, its market share fell from 8% to 2%.

36. Interview with Eric Rosenfeld.

37. Interview with Paula Orlowski Blair. Morse Shoe filed for bankruptcy in July 1991 just weeks after Berkshire agreed to buy H. H. Brown Shoes. Berkshire acquired Lowell Shoe, a subsidiary of Morse Shoe, at the end of 1992, and also bought Dexter Shoe in 1993.

38. Smith Barney, Shearson Lehman, and UBS Securities. The ensuing witch-hunt atmosphere also caused Morgan Stanley to put out a statement denying it was the subject of a government investigation.

39. The Treasury Department/Fed study also revealed that, over a period beginning in early 1986, Salomon had bought more than half the bonds issued in 30 out of 230 auctions (Louis Uchitelle, Stephen Labaton, "When the Regulators Stood Still," *New York Times,* September 22, 1991).

40. Warren Buffett testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon Inc., and Salomon Brothers Inc." Session 13 & 14, November 29, 1993.

41. Contracts differ by employee, by company, and by state, and the indemnification provisions use broad wording that is subject to interpretation, but in general, corporate officers accept the legal risk that goes with their position on the condition that their employers pay legal fees unless they are convicted of fraud or other criminal wrongdoing or have engaged in willful misconduct. Salomon's action was highly unusual at the time and remains unusual. In 2005, KPMG's refusal to pay its partners' legal fees became the subject of lawsuits. In July 2007, a U.S. federal judge dismissed a case against thirteen KPMG employees for promoting aggressive tax shelters, because he determined that the government had strong-armed KPMG into denying them legal payments.

42. Transcript of Federal Open Market Committee meeting, October 1, 1991.

43. Interview with Gary Naftalis.

44. Interview with Otto Obermaier.

45. Ibid.

46. Interview with Gary Naftalis.

47. Interview with Otto Obermaier.

48. Letter to Salomon Inc., shareholders as reprinted in the *Wall Street Journal,* November 1, 1991.

49. Interview with Paula Orlowski Blair.

50. Ibid.

51. Salomon advertisement in the *Wall Street Journal,* November 1, 1991. All of Salomon's growth in earnings for several years had been given back to employees. Salomon performed in the bottom third of stocks in its market-cap class. The third-quarter-income statement would have been drenched with red ink had not the lower bonus pool reversed it. The previous "share the wealth" approach subsidized money-losers so that everyone was richly paid. Buffett's biggest change was to link bonuses to individual and division performance. For the five years ending December 31, 1991, Salomon Inc.'s stock ranked 437th in performance among S&P's top 500 stocks. (1991 Salomon Inc., 10K)

52. Interview with Deryck Maughan.

53. Interview with Jim Robinson.

54. For decades, as a partnership, it had—literally—been run for the employees. It was the inherent separation of capital and labor at a publicly owned investment bank that was the problem.

55. Otto Obermaier. He later wrote "Do the Right Thing: But if a Company Doesn't It Can Limit the Damage," *Barron's,* December 14, 1992.

56. The same was not true of the May two-year note squeeze, in which several small firms were bankrupted. Had it ever been proven that Mozer colluded with the hedge funds to corner the market or submitted false bids in that auction, Salomon's and the individuals' penalties doubtless would have been more severe; the whole story might have ended differently.

57. Interviews with Frank Barron and Bill McLucas. McLucas confirms the gist but can't recall the exact words.

58. Interview with Otto Obermaier.

59. Mozer served his four months after pleading guilty to lying to the Federal Reserve Bank of New York. The SEC and prosecutors took no action against Feuerstein.

60. Gutfreund was also barred from heading a firm without SEC approval.

61. Interview with Paula Orlowski Blair.

62. In fact, Jerry Corrigan did not lift the full ban on Salomon until August 1992.

63. CNBC *Inside Opinion,* Ron Insana interview with Gutfreund, April 20, 1995.

64. Interview with John Gutfreund.

65. Interview with Charlie Munger.

66. The arbitrators were John J. Curran, Harry Aronsohn, and Matthew J. Tolan.

67. Interview with Frank Barron.

68. Those who have spent any significant amount of time with Munger will instantly recognize the sensation

of talking to him when his head is turned off, while something occasionally pierces his band of indifference. *"It's hard to pierce Charlie's band of indifference,"* says Buffett. *"I can tell you that."*

69. Charles T. Munger testimony, "In the Matter of Arbitration Between John H. Gutfreund against Salomon, Inc., and Salomon Brothers, Inc.," Sessions 33 & 34, December 22, 1993.

70. Interview with Sam Butler, Frank Baron.

71. Interview with Frank Barron.

Chapter 50

1. Michael Lewis, "The Temptation of St. Warren," *New Republic,* February 17, 1992.

2. Ron Suskind, "Legend Revisited: Warren Buffett's Aura as Folksy Sage Masks Tough, Polished Man," *Wall Street Journal,* November 8, 1991.

3. Patricia Matson letter to Peter Kann, Norman Pearlstine, Paul Steiger, James Stewart, and Lawrence Ingrassia of the *Journal,* November 18, 1991, and attached chronology of events, in which Tom Murphy recalls explaining to Suskind before publication that he was misquoting and misportraying the conversation; Bill Gates letter to Warren Buffett, November 13, 1991, which says, "The quote is wrong. I never suggested anything of the kind to the reporter." Gates said he called the *Journal* before publication to ensure the incorrect quote would not be published and was "shocked" to see the quote in the article. Memo from Patty Matson, official spokesperson of CapCities/ABC, to "Those possibly interested," November 19, 1991, cc: Buffett, Murphy, Gates, Tisch, which says Steiger of the *Journal* called and acknowledged a "puzzlement" in which someone might have been "gilding the lily."

4. Bill Gates letter to Warren Buffett, November 13, 1991.

5. Interviews with Warren Buffett, Bill Gates. The latter may have heard a version from someone else, which got exaggerated in the retelling. On the other hand, Buffett had to use the facilities somehow.

6. Interview with Bill Gates.

7. For four generations the Gateses named their sons William Henry Gates. Bill Jr.'s father, William Henry III, changed his name to Bill Jr. and his son, the new Bill III—who was actually Bill IV—became known as Trey. Bill Jr. then stepped up to become Bill Sr. as the oldest living William Henry Gates, and his son is now known variously as Trey, Bill III, Bill, and *The* Bill Gates.

8. Interview with Arthur K. Langlie.

9. Interview with Bill Gates.

10. Noyce died June 3, 1990.

11. Interview with Roxanne Brandt.

12. Interview with Bill Gates.

13. Interview with Bill Ruane.

14. Interview with Don Graham.

15. Gates was right; Kodak *was* toast. From January 1990 to December 2007, Kodak stock rose a measly 20%, barely more than 1% a year. The S&P over the same period rose 315%. Berkshire Hathaway rose 1,627%. Microsoft rose 6,853%.

16. Interview with Bill Gates.

17. Ibid.

18. Statistics courtesy of Berkshire Hathaway.

19. Interview with Louis Blumkin.

20. A Scott Fetzer product.

21. Based on various comments from Kelly Broz, Roberta Buffett Bialek, Peter Buffett, Doris Buffett, Susan Clampitt, Jeannie Lipsey, Stan Lipsey, Ron Parks, Marilyn Weisberg, and Racquel Newman.

22. Interviews with Kathleen Cole, Susie Buffett Jr.

23. Interview with Kathleen Cole.

24. Interviews with Susie Buffett Jr., Howie Buffett. This took place at McMillan Junior High.

25. Which works out to $21,000 per year.

26. Interview with Howie Buffett.

27. Interview with Susie Buffett Jr.

28. Kurt Eichenwald, *The Informant*. New York: Broadway Books, 2000.

29. Interview with Susie Buffett Jr.

30. Interview with Bill Gates.

31. Interview with Sharon Osberg.

32. Each die has an advantage over one other and a disadvantage to the third.

33. When Buffett pulled out the dice with the author, he kept insisting that she had to go first. She had no idea what the numbers meant. She figured that if Buffett wanted her to go first, there must be some disadvantage to going first. (Experience as an insurance analyst was helpful here.) She said that the dice must somehow work like rock, paper, scissors, and refused to play. Buffett counted this as "figuring out" the dice, but it wasn't really.

34. The first week the author started working on this book, she came downstairs to the hotel lobby to find the same package.

35. Interviews with Sharon Osberg and Astrid Buffett, who recalls "Sharon was just beside herself."

36. Interview with Sharon Osberg.

37. Interviews with Astrid Buffett, Dick and Mary Holland.

38. Interview with Dody Waugh-Booth.

39. Carol J. Loomis, "My 51 Years (and Counting) at *Fortune*," *Fortune,* September 19, 2005.

40. Depending on how rich they had gotten and how long ago they had been sunburned. Bill Scott, whom

Buffett had made breathtakingly rich, had acquired a deep tan and had begun to resemble Buffett himself.

41. Carnegie built 2,509 libraries (costing $56 million) and established other public works using over 90% of his $480 million steel-made wealth.

42. Ruane's first wife, Elizabeth, suffered from a mood disorder and committed suicide in 1988.

43. Bill Ruane and others recalled this speech.

44. Paul Ehrlich, *The Population Bomb.* New York: Ballantine Books, 1968; Thomas Malthus, *An Essay on the Principles of Population. The Population Bomb* was based on the work of the nineteenth-century demographer and statistician Thomas Malthus, who said that humans procreate in a geometric rather than arithmetic progression; thus the earth's population would inevitably expand beyond the point at which its resources could support it. At some point, Malthus postulated, misery and vice (e.g., war, pandemic, famine, infant mortality, political unrest) would reduce the population to a sustainable level. Malthus's theory had enormous influence on many scientists, including Charles Darwin. Because Malthus failed to take into account a number of factors—for example, simplistically assuming that economic development stimulated population growth—his ideas were and continued to be ridiculed as predicted catastrophes failed to materialize within a decade or two after 1970. The basic concepts of Malthus and the idea of the Malthusian catastrophe are being taken more seriously in some quarters today, however.

45. Buffett, characteristically, uses both low and high numbers higher than the current population number (a margin of safety against looking like an alarmist) even though some experts argue that the "carrying capacity" has already been exceeded.

46. Organizations such as the International Humanist and Ethical Union and Planned Parenthood routinely took this position before 1974. See Paige Whaley Eager, *Global Population Policy: From Population Control to Reproductive Rights.* Burlington, Vt.: Ashgate Publishing Ltd., 2004.

47. This was the Belous case (*People v. Belous,* 71 Cal.2d 954, 458 P.2d 194, 80 Cal. Rptr. 354 [1969]), which declared laws against abortion unconstitutional in California. Munger helped write the opinion. Buffett says he has never seen Munger "so fired up," the most unconventional thing he has ever seen Munger do.

48. Buffett said Munger tempted him into running a church by offering him the job of sexton, until he found out the job description was not what he thought. "We held mock debates over who got to be the preacher."

49. Garrett Hardin, "The Tragedy of the Commons," *Science,* Vol. 162, No. 3859, December 13, 1968. Hardin's theory was essentially a restatement of the "prisoner's dilemma," which also addresses cooperation and "cheating" as covered in references on that subject. In the 1970s it was assumed that economic progress would accelerate population growth, that population growth would prevent economic growth. The earth's "carrying capacity" was assumed to be essentially fixed, rather than at least somewhat flexible through the use of technology and market forces, incorrect assumptions that caused such forecasts to peg the dates of critical population levels too early.

50. Garrett Hardin, "A Second Sermon on the Mount," from *Perspectives in Biology and Medicine,* 1963.

51. Nevertheless, some remnants of the eugenics movement remained alive, and by the millennial era, developments in genetic, genomic, and reproductive science had raised complicated questions about the idea.

52. The historic linkage between "population control," the eugenics movement, and racism is detailed by Allan Chase in *The Legacy of Malthus: The Social Costs of the New Scientific Racism* (New York: Alfred A. Knopf, 1977). While a full treatment of these issues is beyond the scope of this book, what seems clear, from his change in terminology, steering of the Buffett Foundation, and gradual distancing from the Hardin camp, was Buffett's disenchantment with the Malthusian views of Hardin because of their eugenics implications. (Hardin's personal stationery featured a small U.S. map around the words "Quality of the Population.")

53. In a highly controversial move, the Buffett Foundation had paid half the first-year costs to bring the RU-486 abortion pill to the United States.

54. From Eager's *Global Population Policy: From Population Control to Reproductive Rights,* which chronicles the gradual rejection of neo-Malthusianism and coercive population control methods in favor of voluntary, evolutionary changes in birth rates through economic development, reproductive rights, and an emphasis on women's health.

55. In "Foundation Grows: Buffetts Fund Efforts for Population Control" (*Omaha World-Herald,* January 10, 1988), Bob Dorr quotes Susie as saying, "Warren likes numbers…he likes to see concrete results, and you can see them [numbers] change" to explain her husband's interest in groups such as Planned Parenthood and the Population Institute.

56. A similar term, "Ovarian Roulette," was apparently first used by Dr. Reginald Lourie of Children's Hospital, Washington, D.C., at a hearing of the Committee on Government Operations, United States, "Effect of Population Growth on Natural Resources and the Environment," September 15-16, 1969, in a discussion with Garrett Hardin, to describe a mother who takes the risk of an unwanted pregnancy by not using birth control (and the term has since been used by Responsible Wealth). However, it is the second word—"lottery" versus "roulette"—that changes a bad choice to bad luck: from a child who is born unwanted to a woman who trusts to random chance, to a child who is born in cruel circumstances because of random chance.

57. "I Didn't Do It Alone," a report by Chuck Collins's organization, Responsible Wealth.

58. See John Rawls, *A Theory of Justice,* Cambridge: The Belknap Press of Harvard University Press, 1971. The Ovarian Lottery resembles Rawls's view, which is a form of determinism—and assumes that much, though not necessarily all, of what happens to people is *determined* by the present and past, for example, through their genes, or the luck of where they are born and when. The opposite of determinism is free will. From the days of the earliest philosophers, mankind has been debating whether free will exists. Philosophers also debate whether it exists on a scale or is irreconcilable with determinism. Critic Robert Nozick, in *Anarchy, State, and Utopia,* gives the case for irreconcilability in a critique of Rawls that more or less says that economist Adam Smith's invisible hand gives people what they have earned and deserved (*Anarchy, State and Utopia.* New York: Basic Books, 1974). All true libertarians believe in free will and deny absolutely that determinism exists. Since economic policy is so influenced by these ideas, the topic is worth understanding; for example, it sheds light on the debate over how Alan Greenspan's libertarian leanings influenced Federal Reserve policy that led to recent debt-fueled asset bubbles. Likewise, the debate over eugenics in genomism and reprogenetics resounds with issues of determinism and free will.

59. Interview with Bill Gates.

60. In 2005 Oxnam published *A Fractured Mind,* his memoir of living with multiple personality disorder (New York: Hyperion).

61. Interview with Bill Gates.

Chapter 51

1. Anthony Bianco, "The Warren Buffett You Don't Know," *BusinessWeek,* July 5, 1999.

2. Interview with Tony Nicely.

3. This was a 40% premium to where GEICO was trading.

4. In 1993, 707 new issues raised $41.4 billion. In 1994, 608 IPOs raised $28.5 billion, the second-most-productive year in the past quarter century. The third-best year for IPOs had been 1992, when 517 issues raised $24.1 billion. (Securities Data Co. of Newark, N.J.)

5. Molly Baker, Joan Rigdon, "Netscape's IPO Gets an Explosive Welcome," *Wall Street Journal,* August 9, 1995.

6. Interview with Sharon Osberg.

7. The Buffetts made other philanthropic gifts using Susie's stock, as well as funding the Buffett Foundation.

8. Carol Loomis, "The Inside Story of Warren Buffett," *Fortune,* April 11, 1988.

9. Berkshire Hathaway press release, February 13, 1996.

10. Interviews with Dana Neuman, Mark Millard.

11. The employees' pay could not really be fully aligned with shareholders. Unlike at the *Buffalo News,* for example, the employees' base pay at a bank is too low to compensate for the labor value of their time that is owed by the shareholders. In effect, much of the bonus is really salary. The reason that a plan that requires employees to work almost for free in a bad year to compensate for "excessive" bonuses in other years cannot succeed is that it transfers some of the risk assumed by capital onto the backs of labor. The bonus structure of Wall Street—without the glue of partnership—is inherently problematic.

12. To be considered an arbitrage, two trades must take place simultaneously to eliminate market risk. Buying a stock and selling it later is not an arbitrage. Buying cocoa beans in Ecuador and selling them in San Diego is not an arbitrage.

13. Interview with Deryck Maughan.

14. Roger Lowenstein, *When Genius Failed: The Rise and Fall of Long-Term Capital Management.* New York: Random House, 2000.

15. In July 1998, Weill shut down Salomon's bond arbitrage unit. One could argue that it was Travelers' subsequent merger with Citicorp—which provided cheap capital—that made the firm a serious competitor in those businesses. Looked at another way, Travelers paid a high price to enter a business with high barriers to entry, and subsequently exploited its capital and scale advantage. Citigroup dropped the Salomon name in 2001.

16. Carol Loomis, "A House Built on Sand," *Fortune,* October 26, 1998.

17. Interview with Charlie Munger.

18. Lowenstein, in *When Genius Failed,* estimated that these returns were achieved through leverage; Long-Term's cash-on-cash return was only about 1%. This low return, multiplied fifty to a hundred times through borrowing, appeared extraordinarily profitable.

19. In *When Genius Failed,* Lowenstein drew this conclusion after extensive interviews with Meriwether's former team.

20. Roger Lowenstein, *When Genius Failed.* Shorting it as a collection of stocks would not work because of a basis mismatch between Berkshire and the offsetting hedgeable positions. Berkshire was a collection of wholly owned businesses fueled by an insurance company that also owned some stocks, not a quasi-mutual fund.

21. Roger Lowenstein, *When Genius Failed.*

22. Stock or merger arbitrage is a bet on whether a merger will close. Merger-arb specialists talk to lawyers and investment bankers and specialize in scuttlebutt. Their bets are based partly on knowledge about a deal,

not just statistics about how typical deals have done.

23. Interview with Eric Rosenfeld; Lowenstein, *When Genius Failed.*

24. Michael Siconolfi, Anita Raghavan, and Mitchell Pacelle, "All Bets Are Off: How Salesmanship and Brainpower Failed at Long-Term Capital," *Wall Street Journal,* November 16, 1998.

25. Interview with Eric Rosenfeld.

26. The Standard & Poor's index was down 19% since July and the NASDAQ down by more than 25%.

27. John Meriwether letter to investors, September 2, 1998.

28. Warren Buffett letter to Ron Ferguson, September 2, 1998.

29. Hence, don't try to make it back the way you lost it.

30. Interview with Joe Brandon.

31. Craig Torres and Katherine Burton, "Fed Battled 'Financial Maelstrom,' 1998 Records Show," *Bloomberg News,* April 22, 2004.

32. Roger Lowenstein, in *When Genius Failed,* includes, as do other accounts, an interesting sidebar about the role of Goldman Sachs, which, as capital-raiser for the firm, also sent in a mysterious "trader" who spent days downloading Long-Term's positions into a laptop and making mysterious cell-phone calls. Afterward, Long-Term's partners bitterly blamed their demise on predatory behavior by competitors.

33. According to one partner, the lawyer was dubious about the rushed process, saying maybe there was some trickery involved, and wanting to slow things down and take more time to look over the details.

34. Roger Lowenstein, *When Genius Failed.*

35. Michael Lewis, "How the Eggheads Cracked," *New York Times Magazine,* January 24, 1999.

36. Interview with Fred Gitelman, Sharon Osberg.

37. After three 0.25% interest-rate cuts—September 29, October 15, and October 17—the market leapt 24% from its low on August 31 of 7,539 to an all-time high of 9,374 on October 23.

38. Michael Lewis, "How the Eggheads Cracked."

39. Roger Lowenstein, *When Genius Failed.*

40. Interview with Eric Rosenfeld.

41. The Federal Reserve's instant and dramatic cut of interest rates gave rise to a concept called the "Greenspan Put," the idea that the Federal Reserve would swamp the market with liquidity to bail out investors in a crisis. The Greenspan Put theoretically encourages people to worry less about risk. Greenspan denied there was a Greenspan Put. "It takes a good deal longer for the cycle to expand than for it to contract," he said. "Therefore we are innocent." (Reuters, October 1, 2007, quoting Greenspan speaking in London.)

Chapter 52

1. Kurt Eichenwald, *The Informant.* New York: Broadway, 2000. Unbeknownst to Howie, Andreas reportedly made an illegal donation in response to at least one request that Howie had passed along,

shrugging off the fine as the cost of doing business.

2. Interview with Howie Buffett.

3. Ibid.; Scott Kilman, Thomas M. Burton, and Richard Gibson, "Seeds of Doubt: An Executive Becomes Informant for the FBI, Stunning Giant ADM—Price Fixing in Agribusiness Is Focus of Major Probe; Other Firms Subpoenaed—A Microphone in the Briefcase," *Wall Street Journal,* July 11, 1995; Sharon Walsh, "Tapes Aid U.S. in Archer Daniels Midland Probe; Recordings Made by Executive Acting as FBI Informant Lead to Seizure of Company Files," *Washington Post,* July 11, 1995; Ronald Henkoff and Richard Behar, "Andreas's Mole Problem Is Becoming a Mountain," *Fortune,* August 21, 1995; Mark Whitacre, "My Life as a Corporate Mole for the FBI," *Fortune,* September 4, 1995.

4. Interview with Kathleen Cole.

5. Astrid was going to be well taken care of by Warren, too, although, as he says about the apparent willingness of his fans to buy any article belonging to him—his wallet, his car; *"She's got one of my wisdom teeth. It's the ugliest thing you've ever seen. That's her ace in the hole."*

6. Interview with Bill Gates.

7. Every board member interviewed reached some variation of this conclusion, no matter where they stood on later events.

8. Mark Pendergast, *For God, Country, and Coca-Cola.* New York: Charles Scribner's Sons, 1993.

9. Speaking at the 1998 Berkshire Hathaway shareholder meeting.

10. At the time, NetJets marketed itself both as NetJets and by its legal name, Executive Jet, Inc. It was renamed NetJets in 2002.

11. Interviews with sources; Anthony Bianco, "The Warren Buffett You Don't Know," *BusinessWeek,* July 5, 1999.

12. The business requires a "core fleet" of redundant aircraft, so expensive that running a fractional jet company is by definition unprofitable unless done on a huge scale (or used as a loss-leader by an aircraft manufacturer or other company with a tie-in product).

13. It cost Berkshire over nine times what it paid for the remaining half of GEICO almost three years earlier. The GEICO purchase doubled Berkshire's existing float (to $7.6 billion), while Gen Re tripled that (to $22.7 billion).

14. Interview with Tad Montross.

15. BRK paid approximately three times book value, a premium to prevailing prices at the time. The reinsurance business became more competitive after this acquisition, and multiples have since declined.

16. Berkshire Hathaway 1997 annual shareholders' meeting, May 5, 1997.

17. Shawn Tully, "Stock May Be Surging Toward an Earnings Chasm," *Fortune,* February 1, 1999.

18. At the companies' June 19, 1998, press conference, as quoted in "Is There a Bear on Mr. Buffett's Farm?" *New York Times,* August 9, 1998.

19. Buffett's comments in Anthony Bianco's July 5, 1999, *BusinessWeek* cover story, "The Warren Buffett You Don't Know": "'Charlie and I don't talk a lot anymore,' acknowledges Buffett, who says he did not even bother to consult his vice-chairman before making the epochal Gen Re acquisition."

20. BRK dropped 4.2% on news of the deal. Over a month later, it was down 15% versus a flat market. Setting an exchange ratio implicitly required a view on equities and interest rates, as well as the underlying businesses' prospects. What investors could not know was the relative weighting of these factors.

21. James P. Miller, in "Buffett Again Declines to Flinch at Market's High-Wire Act," *Wall Street Journal,* May 5, 1998, got it. He attended the shareholder meeting at which Buffett reiterated his views and commented that maintaining return on equity was a particularly vexing issue. On the other hand, Justin Martin and Amy Kover, in "How Scary is this Market, Really?"(*Fortune,* April 27, 1998), wrote that "no less an authority than Warren Buffett" had endorsed the market bulls through his "not overvalued" statement.

22. On August 22, 1997, Wells Fargo stock nosedived after Berkshire Hathaway reclassified it from the publicly filed form 13-F to the confidential disclosure to the SEC, creating the appearance that Buffett had sold his position in Wells Fargo. The SEC announced that it would consider tightening the confidentiality rules. In June 1998, the SEC announced it was tightening its "13F" rule that had allowed Buffett to file confidentially for a year while building large stock positions. Although the SEC did not absolutely rule out confidential filings, Buffett heard the footsteps. Berkshire Hathaway fought an aggressive battle with the SEC over this issue as its confidential filings were denied, and lost. In 1999, Berkshire filed confidentiality requests each quarter along with its regular 13-F forms containing positions that were not confidential. The SEC made a single announcement relating to these three filings that certain of the positions they contained must be publicly disclosed. Buffett's right to make a profit presumably was not part of the SEC's deliberations. The SEC's interest is to protect investors. While the SEC staff had long held that it is desirable to prevent extraordinary fluctuations in stock prices unrelated to fundamental factors so that investors do not profit or suffer as a result, investors' right to know the identity of a company's largest shareholders outweighed that.

23. Interview with Herbert Allen.

24. Nikhil Deogun, James R. Hagerty, Steve Secklow, and Laura Johannes, "Coke Stains, Anatomy of a Recall: How Coke's Controls Fizzled Out in Europe," *Wall Street Journal,* June 29, 1999.

25. Interview with Herbert Allen.

26. Ibid.

27. Through Project Infinity, partly cloaked in Y2K spending, Coca-Cola turned the soft-drink business into a technology-fed numbers game. In 1999, the company hired 150 experts for worldwide implementation of SAP's programs. SAP, an acronym for Systems, Applications, and Products in Data Processing, provided business software solutions for process redesign in supply-chain management, customer-relationship management, and resource planning.

28. Ivester did not respond to repeated requests for interviews.

29. Betsy Morris and Patricia Sellers, "What Really Happened at Coke," *Fortune,* January 10, 2000.

30. Interview with Sharon Osberg.

31. Betsy Morris, "Doug Is It," *Fortune,* May 25, 1998, and Patricia Sellers, "Crunch Time for Coke," *Fortune,* July 19, 1999.

32. This is Herbert Allen's version of the conversation. Buffett doesn't recall the exact details.

33. "They never sat down, never even removed their overcoats. In tones frostier than the air outside, they told him they had lost confidence in him." Constance L. Hays, *The Real Thing: Truth and Power at the Coca-Cola Company.* New York: Random House, 2004. Buffett and Allen dispute this version and say they sat down and removed their coats. But, they say, it was indeed a very short meeting, with no chitchat.

34. Had the board supported him, it would have left Ivester a weakened CEO. He would also have been gambling that Allen and Buffett would not resign from the board, an instantly fatal blow. Allen and Buffett were also gambling that if Ivester threw himself on the board's mercy and survived, it would not be for long.

35. Interview with James Robinson, former CEO of American Express and Coca-Cola board member.

36. KO stock dropped 14% in two days.

37. Betsy Morris and Patricia Sellers, "What Really Happened at Coke."

38. Martin Sosnoff, "Buffett: What Went Wrong?" *Forbes,* December 31, 1999.

39. Andrew Barry, "What's Wrong, Warren?" *Barron's,* December 27, 1999.

40. Andy Serwer, "The Oracle of Everything," *Fortune,* November 11, 2002.

41. Interview with Kathleen Cole.

42. Interview with Susie Buffett Jr.

43. Interview with Peter Buffett.

44. Interview with Howie Buffett.

45. Interviews with Howie Buffett, Peter Buffett, Susie Buffett Jr.

Chapter 54

1. Joe Lauria, "Buffett Bombs as High-Tech Funds Boom," *Sunday Times* (London), January 2, 2000.

2. The expected profit on the deal was 90%; i.e., the premium covered odds that the lottery would hit 1 out of 10 times whereas in fact it was expected to hit less than 1 out of 100 times.

3. Every 10% change in KO was equivalent to 2.5% of BRK (a percentage that is representative over time), but the stocks often traded almost in tandem—especially when there was bad news at Coca-Cola—as if BRK and KO were one and the same.

4. Beth Kwon, "Buffett Health Scrape Illustrates Power—or Myth—of Message Boards," TheStreet.com, February 11, 2000. The story made the *Financial Times* say, "Warren Buffett may not be sick, but his share price is," in the "Lex" column, February 12, 2000. *Financial Times* described the rap on Buffett not buying tech stocks as a "serious charge."

5. Berkshire Hathaway press release; also see "Berkshire Hathaway Denies Buffett Is Seriously Ill," *New York Times,* February 11, 2000. The way that Buffett uses probabilities to describe things is one of his intriguing qualities; what if he had said that the rumors were 90% false?

6. Ed Anderson, "Thesis vs. Antithesis: Hegel, Bagels, and Market Theories," *Computer Reseller News,* March 13, 2000.

7. Warren Buffett and Charlie Munger, "We Don't Get Paid for *Activity,* Just for Being *Right*. As to How *Long* We'll Wait, We'll Wait *Indefinitely,*" *Outstanding Investor Digest,* Vol. XIII, Nos. 3 & 4, September 24, 1998, and "We Should All Have Lower Expectations—In Fact, Make That *Dramatically* Lower….," *Outstanding Investor Digest,* Vol. XIV, Nos. 2 & 3, December 10, 1999.

8. "Focus: Warren Buffett," *Guardian,* March 15, 2000 (emphasis added).

9. Some commentators understood that the bubble was bursting but since the averages continued to move higher, the general perception was slower to change. Federal Reserve Chairman Alan Greenspan's comments were seized on as reason for concern or relief, depending on the listener's perspective. See Matt Kranz and James Kim, "Bear Stages Sneak Attack on Net Stocks," *USA Today,* February 16, 2000; Greg Ip, "Stalking a Bear Market," *Wall Street Journal,* February 28, 2000; "Technology Stocks Continue to Dominate," *USA Today,* March 2, 2000.

10. E. S. Browning and Aaron Lucchetti, "The New Chips: Conservative Investors Finally Are Saying: Maybe Tech Isn't a Fad," *Wall Street Journal,* March 10, 2000. The *Journal* cited another investor as saying, "It's like when the railroads started up and were changing the whole face of the nation." Yes, it was much like that. Speculation in railroad stocks led directly to the financial panics of 1869, 1873, and 1901. The Erie railroad and Northern Pacific stock corners were only two episodes in the long history of colorful financial chicanery surrounding railroad stocks.

11. Gretchen Morgenson, "If You Think Last Week Was Wild," *New York Times,* March 19, 2000. Another sign that the game was up: On March 20, *Fortune* ran a cover story by Jeremy Garcia and Feliciano Kahn, "Presto Chango: Sales Are HUGE!" accusing many dotcoms of using accounting legerdemain to inflate sales—counting marketing expenses as sales, treating barter revenues as sales, and booking revenues before contracts were signed.

12. Interview with Sue James Stewart.

13. Buffett, who usually dealt with uncomfortable issues by joking about them, ended the 1999 Berkshire annual report (written winter 2000) by saying that he loved running Berkshire, and *"if enjoying life promotes longevity, Methuselah's record is in jeopardy."*

14. This is sort of an inside joke at Berkshire Hathaway.

15. David Henry, "Buffett Still Wary of Tech Stocks—Berkshire Hathaway Chief Happy to Skip 'Manias,'" *USA Today,* May 1, 2000.

16. Buffett owned 14 million barrels of oil at the end of 1997, bought 111 million ounces of silver, and owned $4.6 billion of zero-coupon bonds as well as U.S. Treasuries. The silver represented 20% of the world's annual mine output and 30% of the above-ground vault inventory (Andrew Kilpatrick, *Of Permanent Value: The Story of Warren Buffett: More in '04, California Edition.* Alabama: AKPE, 2004), purchased on terms to avoid disrupting world supply.

17. Interview with Sharon Osberg. The silver was at JP Morgan in London.

18. Buffett measures his performance not by the company's stock price, which he didn't control, but by increase in net worth per share, which he did. There is a link between these two measures over long periods of time. In 1999, book value per share had grown only $^{1}/_{2}$ of 1%. But for the acquisition of General Re, book value per share would have shrunk. Meanwhile, the stock market as a whole was up 21%. Buffett called it a fluke that book value had increased at all, pointing out that in some years it will inevitably decrease. Yet only 4 times in 35 years under Buffett, and not once since 1980, had Berkshire done worse than the market by this measure.

19. James P. Miller, "Buffett Scoffs at Tech Sector's High Valuation," *Wall Street Journal,* May 1, 2000.

20. David Henry, "Buffett Still Wary of Tech Stocks."

21. The Knight-Bagehot Fellows.

22. Interviews with Joseph Brandon, Tad Montross.

23. Interviews with Bill Gates, Sharon Osberg.

24. Amy Kover, "Warren Buffett: Revivalist," *Fortune,* May 29, 2000.

25. Interview with Bill Gates.

26. Berkshire Hathaway press release, June 21, 2000.

Chapter 55

1. Philip J. Kaplan, *F'd Companies: Spectacular Dot-com Flameouts.* New York: Simon & Schuster, 2002.

2. Purchase price not disclosed for these two acquisitions—but both were paid half in cash, half in BRK stock.

3. For $570 million.

4. For $2 billion; it became Berkshire's largest business outside the insurance operations (2000 BRK annual report).

5. For $1 billion.

6. For $1.8 billion cash and $300 million in assumed debt.

7. For $378 million.

8. At the end of 2000, Berkshire had spent more than $8 billion buying companies and still had $5.2 billion in cash and cash equivalents, along with $33 billion in fixed maturity securities and $38 billion in stocks.

9. Berkshire Hathaway letter to shareholders, 2000.

10. Kilts joined Gillette after successfully turning around Nabisco, as only the second outsider in 100 years to run the company.

11. Interview with Susie Buffett Jr.

12. Interviews with Barry Diller, Don Graham, Susie Buffett Jr.

13. "Disney Scrambling to Play Spoiler Role," *New York Post,* July 14, 2001.

14. Marcia Vickers, Geoffrey Smith, Peter Coy, Mara Der Hovanseian, "When Wealth Is Blown Away," *BusinessWeek,* March 26, 2001; Allan Sloan, "The Downside of Momentum," *Newsweek,* March 19, 2001.

15. As of June 2001. From the *Industry Standard*'s Layoff Tracker, along with the Dot-Com Flop Tracker and the Ex-Exec Tracker.

16. Buffett was not the only one concerned about the implication of this relationship. John Bogle, retired chairman of Vanguard, wrote of it in April 2001. However, he concluded that "some version of reality" had returned to the stock market. What made Buffett's speech noteworthy was not use of this particular metric but rather his pessimistic projection of what it meant.

17. One of Buffett's main points was that companies—many of which had been taking gains from surpluses out of their pension plans—were irresponsibly using unrealistic rates of return assumptions and would have to adjust these to reality, which would show the plans to be less well funded or even underfunded.

18. Herbert Stein was an American Enterprise Institute fellow and former chairman of the Council of

Economic Advisors under Richard Nixon, a member of the board of contributors of the *Wall Street Journal,* and an economics professor at University of Virginia. He is known for the quote "If something cannot go on forever, it will stop," and was father to financial writer and actor Ben Stein.

19. As quoted in "Buffett Warns Sun Valley Against Internet Stocks," *Bloomberg,* July 13, 2001.

20. Vicente Fox worked for Coca-Cola for fifteen years, starting as a route supervisor in 1964, then being promoted ten years later to president of its Mexican, and ultimately its Latin American, operations.

21. Interview with Midge Patzer.

22. Interview with Don Graham.

23. Dr. Griffith R. Harsh, IV, Director, Surgical Neuro-Oncology Program at Stanford University Medical School.

24. Interview with Kathleen Cole.

25. Interviews with Bill Gates, Peter Buffett, Howie Buffett.

26. Interview with Susie Buffett Jr.

27. Interviews with Susie Buffett Jr., Don Graham.

28. Karlyn Barker, "Capacity Crowd Expected at Funeral; Schlesinger, Bradlee, Kissinger, Relatives Among Eulogists," *Washington Post,* July 22, 2001.

29. Paul Farhi, "Close Enough to See: TV Coverage Captures Small, Telling Moments," *Washington Post,* July 24, 2001; Steve Twomey, "A Celebrated Life: Thousands Honor Katharine Graham at the Cathedral," *Washington Post,* July 24, 2001; Mary Leonard, "Thousands Pay Tribute to *Washington Post*'s Katharine Graham," *Boston Globe,* July 24, 2001.

30. Karlyn Barker, "Capacity Crowd Expected at Funeral; Schlesinger, Bradlee, Kissinger, Relatives Among Eulogists."

31. Libby Copeland, "Kay Graham's Last Party: At Her Georgetown Home, A Diverse Group Gathers," *Washington Post,* July 24, 2001.

32. The family sold the house shortly after Graham's death.

Chapter 56

1. Interview with Herbert Allen.

2. "The Hut-Sut Song" by Horace Heidt. Words and music by Leo V. Killion, Ted McMichael, and Jack Owens.

3. The event benefited the Boys & Girls Clubs of Omaha, Omaha Children's Museum, Girls Inc., and the Omaha Theater Company for Young People. Over ten years it raised approximately $10 million.

4. Hamlisch was the first person to win three Academy Awards at once, in all three music categories, for the song "The Way We Were"(with co-writers Alan Bergman and Marilyn Bergman), the score to the movie *The Way We Were* (1973), and the adaptation of Scott Joplin's ragtime music for *The Sting* (1973).

5. Interview with Devon Spurgeon.

6. Buffett does not recall the specifics of this call but thinks it probably occurred. The source is Joe Brandon at General Re.

7. Grace Shim, "Warren Buffett, Others Speak About Terrorism at Omaha, Neb., Event," *Omaha World-Herald,* September 12, 2001.

8. Buffett recalled this, and said, *"I think somebody even may have bought a car just because they ran out of rental cars."*

9. According to "Killtown's: Where Was Warren Buffett on 9/11?" (www.killtown.911review.org/buffett.html), referencing rushlimbaugh.com from July 5, 2005.

10. Interview with Bob Nardelli.

11. Interview with Tony Pesavento.

12. Buffett told the author this in 2001, shortly after the terrorist attack.

13. The term "unforeseeable" as an explanation for large losses was virtually universal after 9/11 in the insurance industry.

14. Grace Shim, "Warren Buffett, Others Speak About Terrorism at Omaha, Neb., Event."

15. Interview with Susie Buffett Jr.

16. This initial estimate was revised to $2.4 billion in the December 31 annual report.

17. Charles R. Morris, *The Trillion Dollar Meltdown.* New York: Public Affairs, 2008.

18. Leading to reforms such as not allowing analysts to be compensated based on investment-banking work, and setting up "firewalls" between analysts and investment bankers.

19. For $835 million.

20. For just under $1 billion. Kern moved 850 million cubic feet of gas a day from the Rocky Mountains to Las Vegas and California.

21. This pipeline moved 4.3 billion cubic feet of gas per day. Berkshire bought it for $928 million, after Dynegy had gotten it for $1.5 billion when Enron went bankrupt and NNG was being held as collateral (both had assumed $950 million of NNG's debt). After MidAmerican's two pipeline deals in 2002, it transported 8% of the gas in the U.S.

22. Berkshire joined with Lehman and Citigroup to lend $2 billion to Williams at a 20% interest rate.

23. Pre-9/11, Munich Re and AXA struck a derivatives deal valued at $50 million with Berkshire Hathaway Group to reinsure against an earthquake canceling 2002's FIFA World Cup in South Korea and Japan. BRK would pay regardless of the actual cost of the loss, if the tournament was postponed or canceled because of an earthquake of a certain magnitude. Separately, after 9/11, AXA pulled out of insuring the tournament, and on October 30 National Indemnity stepped in to insure it, allowing the World Cup to proceed.

24. Berkshire Hathaway letter to shareholders, 2007.

25. Interview with Frank Rooney.

26. Gifts of more than $12,000 are subject to this tax.

27. Source: IRS, Statistics of Income Division, March 2007; Joint Committee on Taxation, *Description and Analysis of Present Law and Proposals Relating to Federal Estate and Gift Taxation,* Public Hearing Before the Subcommittee on Taxation and IRS Oversight of the Senate Committee on Finance, March 15, 2001.

28. In 2007, over 8% of the federal budget, or $244 billion, was interest on federal debt. That is almost exactly ten times the amount collected through the estate tax.

29. "I Didn't Do It Alone," a report by Responsible Wealth, describes the role of public investment, family, colleagues, luck, and grace in creating wealth. Organizations like United for a Fair Economy publish research on tax fairness, as do organizations such as the libertarian Cato Institute.

30. "Defending the Estate Tax," *New York Times,* February 16, 2001. In this article, Mr. Bush's own director of Faith-Based and Community Initiatives, John DiIulio, told the *Times* that charitable contributions would likely decrease if the estate tax were repealed. "I don't want to be the skunk at the picnic," he said. "But no, I don't think the estate tax should be eliminated—modified, maybe, but not eliminated."

31. See, for example, Melik Kaylan, "In Warren Buffett's America…" *Wall Street Journal,* March 6, 2001; John Conlin, "Only Individual Freedom Can Transform the World," *Wall Street Journal,* July 26, 2001; Steve Hornig, "The Super-Wealthy Typically Do Not Pay Estate Taxes," *Financial Times,* June 15, 2006; Holman W. Jenkins Jr., "Let's Have More Heirs and Heiresses," *Wall Street Journal,* February 21, 2001.

32. Warren Buffett letter to Senator Ken Salazar, June 8, 2001.

33. William S. Broeksmit, "Begging to Differ with the Billionaire," *Washington Post,* May 24, 2003.

34. Daft had options to buy 650,000 shares, initially estimated as worth $38.1 million to $112.3 million in 2015, depending on how much the stock appreciated. He also got $87.3 million in restricted stock awards, totaling 1.5 million shares. Henry Unger, "If Coca-Cola Chief Daft Fizzles, He'll Lose Millions," *Atlanta Journal-Constitution,* March 3, 2001.

35. The CEO–worker pay gap of 411-to-1 in 2001 was nearly ten times as high as the 1982 ratio of 42-to-1. "If the average annual pay for production workers had grown at the same rate since 1990 as it has for CEOs, their 2001 average annual earnings would have been $101,156 instead of $25,467. If the minimum wage, which stood at $3.80 an hour in 1990, had grown at the same rate as CEO pay, it would have been $21.41 an hour in 2001, rather than the current $5.15 an hour." Scott Klinger, Chris Hartman, Sarah Anderson, and John Cavanagh, "Executive Excess 2002, CEOs Cook the Books, Skewer the Rest of Us, Ninth Annual CEO Compensation Survey." Institute for Policy Studies, United for a Fair Economy, August 26, 2002.

36. Geoffrey Colvin, "The Great CEO Pay Heist," *Fortune,* June 25, 2001. A 2001 option grant later became the subject of controversy in the 2007 stock-option backdating scandal.

37. Warren Buffett, "Stock Options and Common Sense," *Washington Post,* April 9, 2002.

38. Two other companies, Winn-Dixie and Boeing, had earlier started treating stock options as an expense. But they had nothing like Coca-Cola's clout.

39. Warren Buffett, "Who Really Cooks the Books?" *New York Times,* July 24, 2002.

40. Warren Buffett, Securities and Exchange Commission's Roundtable on Financial Disclosure and Auditor Oversight, New York, March 4, 2002.

41. Berkshire Hathaway letter to shareholders, 2002.

42. David Perry, "Buffett Rests Easy With Latest Investment," *Furniture Today,* May 6, 2002.

43. He didn't really want her to come back either, although he looked tempted a few times.

Chapter 57

1. This portrait of Susie in the late 1990s and early millennial era is based on comments from more than two dozen sources who knew her well but cannot be identified by name.

2. Interview with Susan Thompson Buffett.

3. Interview with Howie Buffett.

4. Interest rates, which had been falling since 9/11, hit a low of 1% in June 2003 and remained there until June 2004.

5. This is a shorthand description for investors' limited risk aversion during this period.

6. In "Mortgage Market Needs $1 Trillion, FBR Estimates," Alistair Barr (*MarketWatch,* March 7, 2008) recaps a Friedman, Billings Ramsey research report that estimates that of the total $11 trillion U.S. mortgage market, only $587 billion was backed with equity—meaning that the average U.S. home had scarcely more than 5% equity. Before long, half of all CDOs would be backed by subprime mortgages (David Evans, "Subprime Infects $300 Billion of Money Market Funds," Bloomberg, August 20, 2007).

7. In *The Trillion Dollar Meltdown* (New York: Public Affairs, 2008), Charles Morris explains that because the typical credit hedge fund was leveraged 5:1, the 5% equity was reduced to 1%—a 100:1 leverage ratio, or $1 of capital supporting $100 of debt.

8. He used derivatives himself, but as a borrower, not a lender. Therefore, if things went wrong, he did not have to collect from anyone else.

9. Part of Berkshire Re's reported profits since 2002 are derived from General Re.

10. Alan Greenspan gave a speech on May 8 at the 2003 Conference on Bank Structure and Competition where he voiced his opinion on derivatives. Ari Weinberg, "The Great Derivatives Smackdown," *Forbes,* May 9, 2003.

11. For example, he was called "The Alarmist of Omaha" by Rana Foroohar in *Newsweek* on May 12, 2003.

12. Buffett lent $215 million to Oakwood in debtor-in-possession financing. Through Berkadia (see note 13), he bid $960 million for Conseco Finance. Berkadia representatives left before the auction was over, and were outbid by a consortium that offered $1.01 billion. Berkadia objected to these proceedings and raised its offer to $1.15 billion after it was over, but this effort was rejected by the bankruptcy court judge. The credit bubble for manufactured housing and subprime lenders like Conseco deflated by 2004, more than a year before the broader housing bubble peaked.

13. This deal resembled in some ways another deal he had done two years earlier, partnering with Leucadia National to form Berkadia LLC, which provided a $6 billion secured five-year loan to the bankrupt FINOVA so it could pay down its debt.

14. In *First a Dream,* Jim Clayton recounts that Michael Daniels, an intern who had "tolerated" him through the six-month final edit of the book, got him to autograph a copy to give to Buffett. When he graduated and went to work for UBS, Daniels handed the book over to the next intern, Richard Wright, for delivery. "The Ballad of Clayton Homes" (*Fast Company,* January 2004) claims that the Claytons used Wright to send a message to Buffett.

15. In his memoir, Jim Clayton says people find it hard to believe that he did not return Buffett's call himself. He says it never occurred to him to do so, and he and Buffett have never called each other about business. During the months that the deal was in negotiation and litigation, the author observed that Buffett dealt only

with Kevin Clayton.

16. Interview with Kevin Clayton.

17. Jim Clayton, Bill Retherford, *First a Dream.* (Tennessee: FSB Press, 2002.) The 2004 revised edition gives an account of Berkshire Hathaway's fight for Clayton Homes.

18. Buffett had spent only $50 million in April to purchase PetroChina stock, but that brought Berkshire's ownership to $488 million and over the limit that required disclosure to the Hong Kong Stock Exchange.

19. Buffett said he would buy foreign stocks under the right circumstances; e.g., in the United Kingdom or a newspaper in Hong Kong. However, he did not spend time seriously studying foreign stocks until opportunities in the U.S. began to thin.

20. Warren Buffett, "Why I'm Down on the Dollar," *Fortune,* November 10, 2003.

21. From unpublished coverage of the 2003 Berkshire Hathaway annual meeting, courtesy of *Outstanding Investor Digest*.

22. A major advantage of the deal was Berkshire's access to and low cost of funds. With its AAA credit rating, it could borrow at a far lower rate than any other manufactured-home maker and thus not only survive credit droughts but make money under conditions where Clayton's competitors could not survive.

23. Speaking at the New York Public Library, June 25, 2006.

24. Andrew Ross Sorkin, "Buffett May Face a Competing Bid for Clayton Homes," *New York Times,* July 11, 2003.

25. "Suit Over Sale of Clayton Homes to Buffett," *New York Times,* June 10, 2003. Gray alleged that previous shareholder meetings electing directors had taken place without proper notice. In June the Delaware Chancery Court ruled that Clayton had technically not met the notice requirement, but since the meeting was so well attended by shareholders, the mistake was only technical and results of the meeting would not be overturned.

26. Jennifer Reingold, "The Ballad of Clayton Homes."

27. At its peak before the death of Susan T. Buffett, the foundation spent $15–$30 million per year in total, mostly on reproductive rights.

28. If Buffett had paid dividends and used them for the donations, the whole point would have been moot.

29. Douglas R. Scott Jr., president, Life Decisions International, letter to Warren Buffett, September 26, 2002.

30. The number came from Cindy Coughlon, a Pampered Chef consultant who organized the boycott. Nicholas Varchaver, "Berkshire Gives Up On Giving: How a Pro-Life Housewife Took On Warren Buffett," *Fortune,* August 11, 2003.

31. Compiled from various interviews.

32. Pro-life activists, according to the U.S. National Abortion Federation, have committed 7 murders, attempted 17 other murders, made 388 death threats, kidnapped 4 people, committed 41 bombings, 174 instances of arson, and 128 burglaries, attempted 94 bombings or arsons, made 623 bomb threats, committed 1,306 instances of vandalism, made 656 bioterror threats, and committed 162 instances of assault and battery. These numbers exclude stalking, hoax device/ suspect packages, hate mail, harassing phone calls, trespassing, invasion, Internet harassment, and other less serious incidents. The pro-life movement's activities

have resulted in 37,715 arrests as of 2007. Most mainstream pro-life organizations reject the terrorist wing of the movement, some vocally.

33. Berkshire Hathaway press release, July 15, 2003.

34. Under Delaware law, only shareholders in attendance were eligible to vote on a recess.

35. Jim Clayton, Bill Retherford, *First a Dream.*

36. Interviews with Kevin Clayton and John Kalec, executive vice president and CFO of Clayton Homes.

37. The suit, filed on July 25 by Milberg Weiss Bershad Hynes & Lerach, LLP, initially claimed that Kevin Clayton had asked Janus Capital to continue to support the deal even though it had sold the stock. In court, no evidence of this was found and the case was dismissed.

38. Jennifer Reingold, "The Ballad of Clayton Homes."

39. Jim Clayton cites these figures in *First a Dream,* indicating he could not confirm them.

40. Cerberus memorandum, "For Discussion Purposes," reprinted in Jim Clayton, *First a Dream.*

41. In a few instances, such as NetJets, private-company owners sold to him at lower prices than they could have obtained elsewhere because they wanted Berkshire as an owner.

42. Jim Clayton, Bill Retherford, *First a Dream.*

43. Interview with Kevin Clayton.

44. By 2006, manufactured-home shipments had fallen to 117,510 units and were still declining at an average rate of 32% in 2007 despite a temporary bump in 2005 from Hurricane Katrina. (Source: Manufactured Housing Institute.)

Chapter 58

1. Interview with the Reverend Cecil Williams. Buffett participated in two live auctions for Glide before the first eBay auction.

2. Interview with Kathleen Cole.

3. Interviews with Kathleen Cole, Susie Buffett Jr.

4. Interview with Howie Buffett.

5. Interviews with Howie Buffett, Susie Buffett Jr.

11. Interviews with Marshall Weinberg, Walter and Ruth Scott, Lou Simpson, George Gillespie.

12. Interview with Susie Buffett Jr.

13. Adapted from John Dunn, "Georgia Tech Students Quiz Warren Buffett," *Georgia Tech,* Winter 2003.

14. Bob Woodward, "Hands Off, Mind On," *Washington Post,* July 23, 2001.

Chapter 59

1. Interview with Susie Buffett Jr.

2. Interview with Stan Lipsey; Jonathan D. Epstein, "GEICO Begins Hiring in Buffalo," *Buffalo News,* February 11, 2004.

3. Interviews with Peter Buffett, Howie Buffett, Susie Buffett Jr.

4. Peter and Susie also gave substantial amounts to the Buffett Foundation in their first two years.

5. Generally speaking, federal law governing foundations requires that foundations distribute or use a minimum amount of their assets regularly for their charitable purposes (approximately 5% of the fair market value of the private foundation's investment assets).

6. At the time, Susie had about 35,000 shares in her own name, worth about $2.8 billion, apart from what she might receive as part of Warren's estate should he predecease her.

7. Charles T. Munger, edited by Peter Kaufmann, *Poor Charlie's Almanack: The Wit and Wisdom of Charles T. Munger*. New York: Donning Company Publishers, 2005.

Chapter 60

1. Interview with Kathleen Cole.

2. Interviews with Jamie Dimon, Jeffrey Immelt.

3. Berkshire Hathaway 2004 chairman's letter, annual report.

4. Berkshire Hathaway letter to shareholders, 2006. Buffett had stated these criteria in private earlier.

5. Betsy Morris, "The Real Story," *Fortune,* May 31, 2004.

6. Investors felt that Coke should move aggressively into noncarbonated drinks, but the company insisted that international growth in carbonated beverages—the highest-margin product—was the only way to go. At $50, the stock was also still expensive at 24x earnings and 8.6x book value.

7. Coca-Cola Enterprises took a $103 million charge for the European recall during Ivester's reign. In 1999, Daft had to report the first loss in a decade and take a total of $1.6 billion of charges. Then, in 1Q2000, Daft reported Coke's second quarterly loss in a row—charges for massive restructuring/layoffs and a write-down of excess bottling capacity in India. In 2000, Coke took more charges and cut its projection for annual worldwide unit case volume growth to 5% to 6%, from 7% to 8%. Coke revised its targets again after 9/11.

8. Suppose Berkshire demanded a special deal. On $120 million of purchases, this might be worth, say, a dime a share, estimating liberally. Berkshire earned $5,309 per A equivalent share in 2003. (The company doesn't present cents per share in its financial statements.) To a B shareholder, it would be $^{3}/_{10}$ of a penny per share. It's very hard to make a case that an amount so small would incent Buffett to do something so contrary to Coca-Cola's interests as to force it to turn down a big contract with Burger King in order to keep selling Coca-Cola at Dairy Queen. That would be so even if Berkshire owned zero Coca-Cola stock. The

problem with the ISS approach was its absolutist checklist approach that applies no reasoning and proportionality.

9. CalPERS also opposed the election of Herbert Allen, former U.S. Senator Sam Nunn, and Don Keough because of their business relationships with the company.

10. Herbert Allen, "Conflict-Cola," *Wall Street Journal,* April 15, 2004.

11. Excerpts from a survey of corporate board members conducted by PricewaterhouseCoopers, as reported in *Corporate Board Member,* November/December 2004. PWC identified no comments or sentiment against Buffett.

12. Deborah Brewster, Simon London, "CalPERS Chief Relaxes in the Eye of the Storm," *Financial Times,* June 2, 2004.

13. Interview with Don Graham.

14. "Coke Shareholders Urged to Withhold Votes for Buffett," *Atlanta Business Chronicle,* April 9, 2004.

15. In "The Rise of Independent Directors in the U.S., 1950–2005: Of Shareholder Value and Stock Market Prices" (*Stanford Law Review,* April 2007), Jeffrey N. Gordon concludes, "One of the apparent puzzles in the empirical corporate governance literature is the lack of correlation between the presence of independent directors and the firm's economic performance. Various studies have searched in vain for an economically significant effect on the overall performance of the firm."

16. This issue was resolved through a consent decree on April 18, 2005, in which the company did not pay a fine or admit wrongdoing but promised to clean up its internal audit, compliance, and disclosure systems.

17. The GMP International Union, which also spoke at the meeting.

18. Transcript, Coca-Cola shareholder meeting 2004, courtesy of the Coca-Cola Company; Adam Levy and Steve Matthews, "Coke's World of Woes," *Bloomberg Markets,* July 2004; interviews with several directors and company employees.

19. Transcript, Coca-Cola shareholder meeting 2004, courtesy of the Coca-Cola Company.

20. Adam Levy and Steve Matthews, "Coke's World of Woes." The *New York Times* blasted Coke over severance payments to Heyer and other executives in "Another Coke Classic," June 16, 2004. The criticism was not universal; the *Economist* said Isdell was "welcomed by investors and analysts as a safe pair of hands" ("From Old Bottles," May 8, 2004).

21. For example, Constance L. Hays, in *The Real Thing: Truth and Power at the Coca-Cola Company* (New York: Random House, 2004), makes this inference.

Chapter 61

1. Interview with Tom Newman.

2. Interview with Kathleen Cole.

3. Ibid.

4. The author, too, has for some years sat in the managers' section, although she is not a shareholder.

5. This dinner, which was hosted by Morgan Stanley at the time, subsequently became a private event hosted by the author.

6. Courtesy Paul Wachter, producer, Oak Productions.

7. Tom Strobhar, "Report on B-H Shareholder Meeting," *Human Life International,* May 2004; "Special Report, HLI Embarrasses Warren Buffett in Front of 14,000 Stockholders," July 2004. Mr. Strobhar has a curious history. After serving as a leader in the boycott against Berkshire that resulted in canceling the shareholder-contributions program, he wrote an editorial in the *Wall Street Journal,* "Giving Until It Hurts" (August 1, 2003), criticizing the shareholder-contributions program for being a clandestine way of "paying" Buffett (Notwithstanding that Berkshire made no corporate charitable contributions nor paid a dividend). Strobhar identified himself only as the president of an investment firm in Dayton, Ohio, omitting his role in the boycott and the fact that he was chairman of Life Decisions International. Strobhar went on in 2005 to found Citizen Action Now, an organization designed to fight "the homosexual agenda" and for "an America free from the manipulation of homosexual groups." On the website of his investment firm, he borrows Buffett's reputation by advertising himself (as of November 2007) as "trained in the tradition of Ben Graham, the 'father of security analysis,' whose students include Warren Buffet [sic], 'the world's greatest investor.'…Like Graham and Buffett, Thomas Strobhar's focus is on 'value investing.'"

8. Excerpts from 2004 Berkshire Hathaway annual meeting are from notes of the author.

9. The Omaha Housing Authority bought the house for $89,900.

10. Interview with Susie Buffett Jr.

11. Ibid.

12. Ibid.

13. Ibid.

14. Howard Buffett Jr. (Howie B.), speaking at Susie's funeral.

15. Interview with T. D. Kelsey.

16. Ibid.

17. Interviews with Al Oehrle, Barbara Oehrle.

18. Interview with T. D. Kelsey.

19. Interviews with Herbert Allen, Barbara Oehrle, T. D. Kelsey.

20. Interview with Susie Buffett Jr.

21. Interviews with Herbert Allen, T. D. Kelsey. According to the Oehrles, Herbert Allen, and Barry Diller, the rest of the guests remained in Cody for the weekend and turned the weekend, as best they could, into a sort of tribute to Susie.

22. Interview with Susie Buffett Jr.

23. Interview with Howie Buffett.

24. Interviews with T. D. Kelsey, Herbert Allen.

25. Interviews with Susie Buffett Jr., Peter Buffett.

26. Interviews with Susie Buffett Jr. and Peter Buffett, who both said they found it comforting to have their

mother with them in the plane.

27. Interview with Howie Buffett.

28. Interview with Sharon Osberg.

29. Interview with Susie Buffett Jr.

30. Interview with Devon Spurgeon, whom Susie Jr. called on her honeymoon in Italy. The author was also supposed to make this trip; Buffett's wish for emotional support from women was probably at an all-time high during this period.

Chapter 62

1. She left significant amounts of money to Kathleen Cole and Ron Parks, her longtime trusted caretakers and friends. She left her grandchildren and other people modest amounts, from $10,000 to $100,000.

2. Interview with Tom Newman.

3. Interview with Howie Buffett.

4. Interview with Peter Buffett.

5. A. D. Amorosi, "In 'Spirit,' Tradition Is Besieged by Modern Life," *Philadelphia Inquirer,* May 23, 2005.

6. Interview with Susie Buffett Jr.

7. Interview with Peter Buffett.

11. Charles R. Morris, *The Trillion Dollar Meltdown.* New York: Public Affairs, 2008.

12. Carol Loomis, "Warren Buffett Gives It Away," *Fortune,* July 10, 2006.

13. Ibid.

14. Buffett could not resist: The note that accompanied Bertie's letter containing this comment said, *"She's still smarting about that a little bit."*

15. Interview with Doris Buffett.

16. In installments beginning in 2006, as long as either Bill or Melinda Gates is active in the foundation.

17. The first installment of 602,500 shares declined 5% a year in terms of shares thereafter. Buffett expected, as was reasonable, that the price of Berkshire's stock would increase by at least 5% a year (through modest growth and inflation). Thus, the dollar value of the gifts was likely to remain level or even increase from year to year. During the year between the first gift and the second, Berkshire's stock price went up 17%. The first 602,500-B-share distribution was worth $1.8 billion, compared to the second 572,375-B-share distribution worth $2 billion. In June 2006, BRK was trading at $91,500 (B shares at $3,043).

18. As quoted in "The Life Well Spent: An Evening with Warren Buffett," November 2007.

19. Bill Gates used the term "convenors." This approach differs, for example, from annually funding a vaccine program, which requires a continuing investment without a permanent cure.

20. "The New Powers of Giving," *Economist,* July 6, 2006; Karen DeYoung, "Gates, Rockefeller Charities Join to Fight African Hunger," *Washington Post,* September 13, 2006; Han Wilhelm, "Big Changes at the Rockefeller Foundation," *Chronicle of Philanthropy,* September 8, 2006; Andrew Jack, "Manna from Omaha: A Year of 'Giving While Living' Transforms Philanthropy," *Financial Times,* December 27, 2006.

21. Interview with Doris Buffett. See Sally Beaty, "The Wealth Report: The Other Buffett," *Wall Street Journal,* August 3, 2007.

22. Former President Jimmy Carter letter to Warren Buffett, October 18, 2006.

23. The guinea worm enters the body through the drinking of tainted water, then grows up to three feet long and the width of a paper clip. The worm burns its way out through the skin by emitting an excruciatingly painful acid, emerging a few inches a day as sufferers wind it around a twig. They often seek relief by plunging into water, where the erupting worm releases a cloud of larvae to begin the cycle anew. The Carter Center and other nongovernmental organizations are tantalizingly close to wiping out the guinea worm.

24. Interview with Astrid Buffett.

25. After Susie's death, both of her apartments in San Francisco's Pacific Heights were sold, as was the Buffetts' second house, "the dormitory," in Emerald Bay. Buffett kept the original house in Emerald Bay, which continues to be used by his children and grandchildren. He never goes there.

26. On December 12, 2007, major central banks began to provide funding at terms longer than overnight, and began to auction funding against a broader range of collateral and with a broader set of counterparties. The Federal Reserve activated swap lines to help the other central banks provide liquidity in dollars to their markets.

27. Using the return on capital figure he achieved for shareholders through 2007 as a proxy, the author estimates that Buffett (not including Susie's shares) would have been worth between $71 and $111 billion by the end of 2007 had he continued to charge his "partners" fees. Susie's stake would have been worth another $3.7–$5 billion. The difference between the high and low range is the fee structure (Buffett's former 25% plus 6% interest on capital to all partners—the high number—vs. the 2%/20% structure of most hedge funds today—the low number). The calculation assumes that Buffett took out the equivalent of his 6% a year for living expenses, as he typically did while running the partnership. That amounts to $1 million per year by 2007. His and Susie's (really Susie's) living expenses exceeded this by a wide margin; however, Buffett's personal investments—not part of Berkshire—also compounded at an astonishing rate and could (and did) fund Susie's lifestyle without further withdrawals from Berkshire.

28. Interview with Charlie Munger.

Afterword

1. Michael Santoli, "They've Got Class," *Barron's,* September 10, 2007.

2. E. S. Browning, "Stocks Tarnished by 'Lost Decade,'" *Wall Street Journal,* March 26, 2008.

3. Warren Buffett letter to Nicole Buffett, August 10, 2006.

4. Richard Johnson with Paula Froelich, Chris Wilson, and Bill Hoffmann, "Buffett to Kin: You're Fired!," *New York Post,* September 7, 2006.

5. This excludes approximately $180 million of imputed investment income on the $5.5 billion of General

Re's cash that Buffett had transferred to National Indemnity and Columbia Insurance through intercompany reinsurance agreements. General Re estimated the effect on its return on equity at 150 basis points in each of 2005, 2006, and 2007.

6. The combination of underwriting profits and higher float produced a 20% return on average equity in 2006 compared to losses in earlier years. Gen Re grew its book value at an average of 12.8% since 2001, bringing its capital to more than $11 billion, compared to $8.6 billion when it was acquired. General Re made a $526 million profit from underwriting on premiums of about $6 billion—compared to earlier losses of between $1 and $3 billion (depending on the year) on premiums of just under $9 billion. Float had risen from about $15 billion to $23 billion on a 32% decline in premiums.

7. Joseph P. Brandon letter to Warren Buffett, January 25, 2008.

8. Berkshire Hathway 2007 letter to shareholders.

O'Brien, "Investigation of Insurance Puts Buffett in Spotlight," *New York Times,* March 28, 2005; Timothy L. O'Brien and Joseph B. Treaster, "The Insurance Scandal Shakes Main Street," *New York Times,* April 17, 2005; Marisa Taylor, "U.S. Dropped Enron-Like Fraud Probe," *McClatchy Newspapers,* July 23, 2007; Scott Horton, "Corporate Corruption and the Bush Justice Department," *Harper's Magazine,* July 24, 2007.

A Personal Note About Research

To write *The Snowball,* I spent more than five years interviewing Warren Buffett, both in person and on the phone. For weeks on end I sat in his office or traveled with him observing him work. Some of my most valuable insights came from my own experiences with him. I also interviewed his family, friends, former classmates, business associates, and others—250 people in all. Some of these interviews continued for days and I interviewed many people several times.

Warren gave me virtually unlimited time, and let me roam with surprising freedom among the files and correspondence in his exhaustive collection; it was especially fortunate that he and many of his friends and family members were letter-writers. Berkshire Hathaway's files contained material that helped establish a timeline and flesh out details. I also relied on my own growing understanding of Warren, and at times on my direct knowledge of events. Certain disagreements among sources are aired in the endnotes.

Quotes appear throughout the book to illuminate the narrative. Most quotes are from recorded interviews, and have been edited only for clarity and length. Sources were cited unless the interviewee asked not to be named.

During their interviews, many people recalled remarks from past conversations. Sometimes the events they were describing had taken place decades earlier. It would be naive to assume that all of these quotes are verbatim recollections of every word spoken. Nevertheless, I found them very helpful in conveying the substance of an incident or conversation. Their sources can be found in the endnotes.

In the end, my own extensive experience with Warren and the thousands of jigsaw puzzle pieces given me by so many sources came together in this portrait of a fascinating and deeply complex man.

Acknowledgments

Without the help of many people this book would never have come into being. If I've succeeded, it's mainly thanks to the generosity of others. First among them, of course, is Warren Buffett. The generosity he showed by giving me so much access to his time, his family, his friends, and his files, and the courage he showed by refraining from meddling with the book for more than five years—right up until the day it went to the printer—are remarkable. His conviction that a smart person can do anything and his gentle but persistent Carnegizing lifted my aspirations as a writer and as a person, and changed my life. His influence on me cannot be described in a paragraph or a couple of pages—but for everything, Warren, I am grateful.

My literary agent, the peerless David Black, gave impeccable guidance. I trust him implicitly—above all to tell me important things that I don't want to hear—the most valuable quality you can have in a friend. He also stunned Warren into a moment of silence at his negotiating skill, not a small achievement.

My great good fortune was that the book was sold to the perceptive Irwyn Applebaum, the president and publisher of Bantam Dell, whose support and wisdom have inspired me throughout. Helping me was Ann Harris, my editor, who elevated *The Snowball* through her encouragement to write the story of a man's life seen in whole, and her editing with a meticulous eye for tone, context, and nuance. Later in the process, Beth Rashbaum unsheathed her red pencil, relentlessly pruning material this first-time author couldn't bear to cut herself, to the immeasurable improvement of the book. *The Snowball* owes much to them and I am grateful to have worked with two such talented editors. Any flaws, of course, are mine alone.

At Bantam I also thank Loren Noveck, who as the book's title administrator oversaw the multiple processes involved in producing a complex book; Virginia Norey, its designer; Ann's assistant Angela Polidoro; and the several others who collaborated in making *The Snowball* happen: deputy publisher Nita Taublib; publishing director Gina Wachtel; attorney Matthew Martin; production experts Tom Leddy, Maggie Hart, and Margaret Benton; creative marketing director Betsy Hulsebosch and her team; sales marketing director Cynthia Lasky; and publicity director Barb Burg.

I wrote this book while associated with Morgan Stanley as an advisory director, and appreciate my friends' and colleagues' and the firm's support. Throughout, Lisa Edwards, my friend and assistant, organized the material, scheduled interviews, planned my annual Berkshire Hathaway dinner, handled innumerable other matters, and generally kept my life together. Lauren Esposito, my researcher, who also came from Morgan Stanley, brought with her a set of financial skills that added immensely to the book, and became adept at locating critical research material. To watch an artist like Marion Ettlinger at work inspired me near the end of the writing, and I thank her for the result.

Doris Buffett, Roberta Buffett Bialek, and Warren Buffett's children Susan, Howard, and Peter, Charlie Munger, Bill Gates, and Don Graham were especially generous with their time and insight, and I am grateful to them for their important contributions.

People trusted by both me and Warren—Sharon Osberg, Vinay Saqi, and Devon Spurgeon—provided various

types of assistance throughout, from financial commentary to calming frayed nerves. The love and support of my sister, Elizabeth Davey, and my father, Ken Davey, helped bring the book into being. David Moyer came into my life just in time to learn what it means to live with a writer who is finishing a book on deadline, and kiddingly referred to himself as my "fiancé in exile" while providing a shoulder to lean on, advice, laughter, love, and romance. He, along with Sharon Osberg and Justin Bennett, served as early readers, and *The Snowball* would be far poorer without their comments and advice.

I am indebted to many other people and organizations who helped with research and granted permission to use photographs and copyrighted material, as well as those who gave special help with the project directly or indirectly in various ways. My thanks go to Carol Allen, Herbert Allen, Ed Anderson and Joan Parsons, Jan and Brian Babiak, the Blumkin family, Hal Borthwick, Debbie Bosanek, Betsy Bowen, Joe Brandon, Phil Brooks, Kelly Broz, Jan and John Cleary, Carlon Colker, Robert Conte, Gerald Corrigan, Michael Daly, Leigh Ann Elisio, Stuart Erickson, Paul Fishman, Cynthia George, George Gillespie, Rick Guerin, Marc Hamburg, Carol Hayes, Liz Hylton, Mark Jankowski, Mr. and Mrs. Howard Jessen, Gladys Kaiser, Don Keough, Tom and Virginia Knapp, Margaret Landon, Arthur K. Langlie, David Larabell, Stanford Lipsey, Jack Mayfield, John Macfarlane, Michael McGivney, Verne McKenzie, Charles T. Munger Jr., Molly Munger, Wendy Munger, Tony Nicely, Dorothe Obert, Ron Olson, Chuck Peterson, Susan Raihofer, Rod Rathbun, Deb Ray, Eric Rosenfeld, Neil Rosini, Fred Reinhardt, Mick Rood, Gary Rosenberg, Edith Rubinstein, Michael Ruddell, Richard Santulli, Walter Schloss, Lou Simpson, Carol Sklenicka, Judge Stanley Sporkin, Mary Stanton Plowden-Wardlaw, Chris Stavrou, Bob Sullivan, Jeffrey Vitale, Marshall Weinberg, Sheila Weitzel, Bruce Whitman, Jackie Wilson, Al Zanner, and those who asked not to be named.

I would also like to express appreciation to the following organizations: the Douglas County Historical Society, GEICO, General Re, Greenwich Emergency Medical Service, Greif Inc., Harvard Business School, Harvard Law School, the Merrick Library, the Martin Luther King Jr. Public Library Washingtoniana Collection, Morgan Stanley, the National Archives, National Indemnity Corporation, the Nebraska Furniture Mart, the New Bedford Free Public Library, the New Bedford Whaling Museum, the New York Public Library, NetJets Inc., the Omaha Press Club, the *Omaha World-Herald, Outstanding Investor Digest,* the Rolls-Royce Foundation, Rosehill School, Ruane Cunniff & Goldfarb Co., The Securities and Exchange Commission, and The Westchester apartments.

WARREN BUFFETT

AND THE

INTERPRETATION OF FINANCIAL STATEMENTS

Introduction

For twelve years, from 1981 to 1993, I was the daughter-in-law of Warren Buffett, the world's most successful investor and now its greatest philanthropist.

Shortly after I married Warren's son Peter, and long before most of the world outside Wall Street had ever heard of Warren, I visited their family home in Omaha. While there, I met a small group of devoted students of the master investor's wisdom who referred to themselves as Buffettologists. One of the most successful Buffettologists, David Clark, kept notebooks filled with Warren's wisdom on investing, which were meticulous and endlessly fascinating to read. His notebooks were the foundation upon which he and I later shaped the internationally best-selling investment books: *The Tao of Warren Buffett, Buffettology, The Buffettology Workbook,* and *The New Buffettology,* which are now published in seventeen languages, including Hebrew, Arabic, Chinese, and Russian.

After the tremendous success of *The Tao of Warren Buffett,* I met up with David in Omaha during the 2007 Berkshire Hathaway annual meeting, and over lunch we fell into a dis-

cussion on the history of investment analysis. David pointed out that investment analysis during the late nineteenth century and the early part of the twentieth century was focused primarily on determining a company's solvency and earning power for the purposes of bond analysis. And that Benjamin Graham, the dean of Wall Street and Warren's mentor, had adapted early bond analysis techniques to common stocks analysis.

But Graham never made the distinction between a company that held a long-term competitive advantage over its competitors and one that didn't. He was only interested in whether or not the company had sufficient earning power to get it out of the economic trouble that had sent its stock price spiraling downward. He wasn't interested in owning a position in a company for ten or twenty years. If it didn't move after two years, he was out of it. It's not like Graham missed the boat; he just didn't get on the one that would have made him, like Warren, the richest man in the world.

Warren, on the other hand, after starting his career with Graham, discovered the tremendous wealth-creating economics of a company that possessed a long-term competitive advantage over its competitors. Warren realized that the longer you held one of these fantastic businesses, the richer it made you. While Graham would have argued that these super businesses were all overpriced, Warren realized that he didn't have to wait for the stock market to serve up a bargain price,

that even if he paid a fair price, he could still get superrich off of those businesses.

In the process of discovering the advantages of owning a business with a long-term competitive advantage, Warren developed a unique set of analytical tools to help identify these special kinds of businesses. Though rooted in the old school Grahamian language, his new way of looking at things enabled him to determine whether the company could survive its current problems. Warren's way also told him whether or not the company in question possessed a long-term competitive advantage that would make him superrich over the long run.

At the end of the lunch, I asked David if he thought it would be possible to create a small, easy-to-use guide to reading a company's financial statement, using the unique set of tools Warren had developed for uncovering these wonderfully profitable businesses.

I envisioned a straightforward and easy-to-understand book that would teach investors how to read a company's financial statement, to look for the same kinds of companies that Warren does. A book that not only would explain what a balance sheet and income statement are, but would point out what investors should look for if, like Warren, they are searching for a company that possesses a long-term competitive advantage.

David loved the idea, and within a month we were trading back and forth chapters of the book you now hold in your

hands, *Warren Buffett and the Interpretation of Financial Statements*.

We hope this book will help you make the quantum leap that Warren made by enabling you to go beyond the old-school Grahamian valuation models and discover, as Warren did, the phenomenal long-term wealth-creating power of a company that possesses a durable competitive advantage over its competitors. In the process you'll free yourself from the costly manipulations of Wall Street and gain the opportunity to join the growing ranks of intelligent investors the world over who are becoming tremendously wealthy following in the footsteps of this legendary and masterful investor.

MARY BUFFETT
JULY 2008

"You have to understand accounting and you have to understand the nuances of accounting. It's the language of business and it's an imperfect language, but unless you are willing to put in the effort to learn accounting—how to read and interpret financial statements—you really shouldn't select stocks yourself."

—Warren Buffett

CHAPTER 1

Two Great Revelations That Made Warren the Richest Person in the World

In the mid-sixties Warren began to reexamine Benjamin Graham's investment strategies. In doing so he had two stunning revelations about what kinds of companies would make the best investments and the most money over the long run. As a direct result of these revelations he altered the Graham-based value investment strategy he had used up until that time and in the process created the greatest wealth-investment strategy the world has ever seen.

It is the purpose of this book to explore Warren's two revelations—

1. How do you identify an exceptional company with a durable competitive advantage?
2. How do you value a company with a durable competitive advantage?

—to explain how his unique strategy works, and how he uses financial statements to put his strategy into practice. A practice that has made him the richest man in the world.

CHAPTER 2

The Kind of Business That Will Make Warren Superrich

To understand Warren's first great revelation we need to understand the nature of Wall Street and its major players. Though Wall Street provides many services to businesses, for the last 200 years it has also served as a large casino where gamblers, in the guise of speculators, place massive bets on the direction of stock prices.

In the early days some of these gamblers achieved great wealth and prominence. They became the colorful characters people loved reading about in the financial press. Big "Diamond" Jim Brady and Bernard Baruch are just a few who were drawn into the public eye as master investors of their era.

In modern times institutional investors—mutual funds, hedge funds, and investment trusts—have replaced the big-time speculators of old. Institutional investors "sell" them-

selves to the masses as highly skilled stock pickers, parading their yearly results as advertising bait for a shortsighted public eager to get rich quickly.

As a rule, stock speculators tend to be a skittish lot, buying on good news, then jumping out on bad news. If the stock doesn't make its move within a couple of months, they sell it and go looking for something else.

The best of this new generation of gamblers have developed complex computer programs that measure the velocity of how fast a stock price is either rising or falling. If a company's shares are rising fast enough, the computer buys in; if the stock price is falling fast enough, the computer sells out. Which creates a lot of jumping in and out of thousands of different stocks.

It is not uncommon for these computer investors to jump into a stock one day, then jump out the next. Hedge fund managers use this system and can make lots and lots of money for their clients. But there is a catch: They can also lose lots and lots of money for their clients. And when they lose money, those clients (if they have any money left) get up and leave, to go find a new stock picker to pick stocks for them.

Wall Street is littered with the stories of the rise and fall of hot and not-so-hot stock pickers.

This speculative buying and selling frenzy has been going on for a long, long time. One of the great buying frenzies of all times, in the 1920s, sent stock prices into the stratosphere.

But in 1929 came the Crash, sending stock prices spinning downward.

In the early 1930s an enterprising young analyst on Wall Street by the name of Benjamin Graham noticed that the vast majority of hotshot stock pickers on Wall Street didn't care at all about the long-term economics of the businesses that they were busy buying and selling. All they cared about was whether the stock prices, over the short run, were going up or down.

Graham also noticed that these hot stock pickers, while caught up in their speculative frenzy, would sometimes drive up the stock prices to ridiculous levels in relation to the long-term economic realities of the underlying businesses. He also realized that these same hotshots would sometimes send stock prices spiraling to insane lows that similarly ignored the businesses' long-term prospects. It was in these insane lows that Graham saw a fantastic opportunity to make money.

Graham reasoned that if he bought these "oversold businesses" at prices below their long-term intrinsic value, eventually the market would acknowledge its mistake and revalue them upward. Once they were revalued upward, he could sell them at a profit. This is the basis for what we know today as value investing. Graham was the father of it.

What we have to realize, however, is that Graham really didn't care about what kind of business he was buying. In his world every business had a price at which it was a bargain.

When he started practicing value investing back in the 1930s, he was focused on finding companies trading at less than half of what they held in cash. He called it "buying a dollar for 50 cents." He had other standards as well, such as never paying more than ten times a company's earnings and selling the stock if it was up 50%. If it didn't go up within two years, he would sell it anyway. Yes, his perspective was a bit longer than that of the Wall Street speculators, but in truth he had zero interest in where the company would be in ten years.

Warren learned value investing under Graham at Columbia University in the 1950s and then, right before Graham retired, he went to work for him as an analyst in Graham's Wall Street firm. While there Warren worked alongside famed value investor Walter Schloss, who helped school young Warren in the art of spotting undervalued situations by having him read the financial statements of thousands of companies.

After Graham retired, Warren returned to his native Omaha, where he had time to ponder Graham's methodology far from the madding crowd of Wall Street. During this period, he noticed a few things about his mentor's teachings that he found troubling.

The first thing was that not all of Graham's undervalued businesses were revalued upward; some actually went into bankruptcy. With every batch of winners also came quite a few losers, which greatly dampened overall performance. Graham tried to protect against this scenario by running a

broadly diversified portfolio, sometimes containing a hundred or more companies. Graham also adopted a strategy of getting rid of any stock that didn't move up after two years. But at the end of the day, many of his "undervalued stocks" stayed undervalued.

Warren discovered that a handful of the companies he and Graham had purchased, then sold under Graham's 50% rule, continued to prosper year after year; in the process he saw these companies' stock prices soar far above where they had been when Graham unloaded them. It was as if they bought seats on a train ride to Easy Street but got off well before the train arrived at the station, because he had no insight as to where it was headed.

Warren decided that he could improve on the performance of his mentor by learning more about the business economics of these "superstars." So he started studying the financial statements of these companies from the perspective of what made them such fantastic long-term investments.

What Warren learned was that these "superstars" all benefited from some kind of competitive advantage that created monopoly-like economics, allowing them either to charge more or to sell more of their products. In the process, they made a ton more money than their competitors.

Warren also realized that if a company's competitive advantage could be maintained for a long period of time—if it was "durable"—then the underlying value of the business

would continue to increase year after year. Given a continuing increase in the underlying value of the business, it made more sense for Warren to keep the investment as long as he could, giving him a greater opportunity to profit from the company's competitive advantage.

Warren also noticed that Wall Street—via the value investors or speculators, or a combination of both—would at some point in the future acknowledge the increase in the underlying value of the company and push its stock price upward. It was as if the company's durable competitive advantage made these business investments a self-fulfilling prophecy.

There was something else that Warren found even more financially magical. Because these businesses had such incredible business economics working in their favor, there was zero chance of them ever going into bankruptcy. This meant that the lower Wall Street speculators drove the price of the shares, the less risk Warren had of losing his money when he bought in. The lower stock price also meant a greater upside potential for gain. And the longer he held on to these positions, the more time he had to profit from these businesses' great underlying economics. This fact would make him tremendously wealthy once the stock market eventually acknowledged these companies' ongoing good fortune.

All of this was a complete upset of the Wall Street dictum that to maximize your gain you had to increase your underlying risk. Warren had found the Holy Grail of investments; he

had found an investment where, as his risk diminished, his potential for gain increased.

To make things even easier, Warren realized that he no longer had to wait for Wall Street to serve up a bargain price. He could pay a fair price for one of these super businesses and still come out ahead, provided he held the investment long enough. And, adding icing to an already delicious cake, he realized that if he held the investment long-term, and he never sold it, he could effectively defer the capital gains tax out into the far distant future, allowing his investment to compound tax-free year after year as long as he held it.

Let's look at an example: In 1973 Warren invested $11 million in The Washington Post Company, a newspaper with durable competitive advantage, and he has remained married to this investment to this day. Over the thirty-five years he has held this investment, its worth has grown to an astronomical $1.4 billion. Invest $11 million and make $1.4 billion! Not too shabby, and the best part is that because Warren has never sold a single share, he still has yet to pay a dime of tax on any of his profits.

Graham, on the other hand, under his 50% rule, would have sold Warren's Washington Post investment back in 1976 for around $16 million and would have paid a capital gains tax of 39% on his profits. Worse yet, the hotshot stock pickers of Wall Street have probably owned this stock a thousand times in the last thirty-five years for gains of 10 or 20% here

and there, and have paid taxes each time they sold it. But Warren milked it for a cool 12,460% return and still to this day hasn't paid a red cent in taxes on his $1.4 billion gain.

Warren has learned that time will make him superrich when he invests in a company that has a durable competitive advantage working in its favor.

CHAPTER 3

Where Warren Starts His Search for the Exceptional Company

Before we start looking for the company that will make us rich, which is a company with a durable competitive advantage, it helps if we know where to look. Warren has figured out that these super companies come in three basic business models: They sell either a unique product or a unique service, or they are the low-cost buyer and seller of a product or service that the public consistently needs.

Let's take a good look at each of them.

Selling a unique product: This is the world of Coca-Cola, Pepsi, Wrigley, Hershey, Budweiser, Coors, Kraft, *The Washington Post,* Procter & Gamble, and Philip Morris. Through the process of customer need and experience, and advertising promotion, the producers of these products have placed the stories of their products in our minds and in

doing so have induced us to think of their products when we go to satisfy a need. Want to chew some gum? You think of Wrigley. Feel like having a cold beer after a hot day on the job? You think of Budweiser. And things do go better with Coke.

Warren likes to think of these companies as owning a piece of the consumer's mind, and when a company owns a piece of the consumer's mind, it never has to change its products, which, as you will find out, is a good thing. The company also gets to charge higher prices and sell more of its products, creating all kinds of wonderful economic events that show up on the company's financial statements.

Selling a unique service: This is the world of Moody's Corp., H&R Block Inc., American Express Co., The ServiceMaster Co., and Wells Fargo & Co. Like lawyers or doctors, these companies sell services that people need and are willing to pay for—but unlike lawyers and doctors, these companies are institutional specific as opposed to people specific. When you think of getting your taxes done you think of H&R Block, you don't think of Jack the guy at H&R Block who does your taxes. When Warren bought into Salomon Brothers, an investment bank (now part of Citigroup), which he later sold, he thought he was buying an institution. But when top talent started to leave the firm with the firm's biggest clients, he realized it was people specific. In people-specific firms workers can demand and get a large part of the firm's

profits, which leaves a much smaller pot for the firm's owners/shareholders. And getting the smaller pot is not how investors get rich.

The economics of selling a unique service can be phenomenal. A company doesn't have to spend a lot of money on redesigning its products, nor does it have to spend a fortune building a production plant and warehousing its wares. Firms selling unique services that own a piece of the consumer's mind can produce better margins than firms selling products.

Being the low-cost buyer and seller of a product or service that the public has an ongoing need for: This is the world of Wal-Mart, Costco, Nebraska Furniture Mart, Borsheim's Jewelers, and the Burlington Northern Santa Fe Railway. Here, big margins are traded for volume, with the increase in volume more than making up for the decrease in margins. The key is to be both the low-cost buyer and the low-cost seller, which allows you to get your margins higher than your competitor's and still be the low-cost seller of a product or service. The story of being the best price in town becomes part of the consumer's story of where to shop. In Omaha, if you need a new stove for your home, you go the Nebraska Furniture Mart for the best selection and the best price. Want to ship your goods cross-country? The Burlington Northern Santa Fe Railway can give you the best deal for your money. Live in a small town and want the best selection with the best prices? You go to Wal-Mart.

It's that simple: Sell a unique product or service or be the low-cost buyer and seller of a product or service, and you get to cash in, year after year, just as though you broke the bank at Monte Carlo.

CHAPTER 4

Durability Is Warren's Ticket to Riches

Warren has learned that it is the "durability" of the competitive advantage that creates all the wealth. Coca-Cola has been selling the same product for the last 122 years, and chances are good that it will be selling the same product for the next 122 years.

It is this consistency in the product that creates consistency in the company's profits. If the company doesn't have to keep changing its product, it won't have to spend millions on research and development, nor will it have to spend billions retooling its plant to manufacture next year's model. So the money piles up in the company's coffers, which means that it doesn't have to carry a lot of debt, which means that it doesn't have to pay a lot in interest, which means that it ends up with lots of money to either expand its operations or buy back its stock, which will drive up earnings and the price of the company's stock—which makes shareholders richer.

So when Warren is looking at a company's financial statement, he is looking for consistency. Does it consistently have high gross margins? Does it consistently carry little or no debt? Does it consistently *not* have to spend large sums on research and development? Does it show consistent earnings? Does it show a consistent growth in earnings? It is this "consistency" that shows up on the financial statement that gives Warren notice of the "durability" of the company's competitive advantage.

The place that Warren goes to discover whether or not the company has a "durable" competitive advantage is its financial statements.

CHAPTER 5

Financial Statement Overview: Where the Gold Is Hidden

Financial statements are where Warren mines for companies with the golden durable competitive advantage. It is the company's financial statements that tell him if he is looking at a mediocre business forever moored to poor results or a company that has a durable competitive advantage that is going to make him superrich.

Financial statements come in three distinct flavors:

First, there is the *Income Statement*: The income statement tells us how much money the company earned during a set period of time. The company's accountants traditionally generate income statements for shareholders to see for each three-month period during the fiscal year and for the whole fiscal year. Using the company's income statement, Warren can determine such things as the company's margins, its return equity, and, most important, the consistency and direction of its earnings. All of these factors are necessary in determining whether the company is benefiting from a durable competitive advantage.

The second flavor is the *Balance Sheet*: The balance sheet tells us how much money the company has in the bank and how much money it owes. Subtract the money owed from the money in the bank and we get the net worth of the company. A company can create a balance sheet for any given day of the year, which will show what it owns, what it owes, and its net worth for that particular day.

Traditionally, companies generate a balance sheet for shareholders to see at the end of each three-month period of time (called quarter) and at the end of the accounting or fiscal year. Warren has learned to use some of the entries on the balance sheet—such as the amount of cash the company has or the amount of long-term debt it carries—as indicators of the presence of a durable competitive advantage.

Third, there is the *Cash Flow Statement*: The cash flow statement tracks the cash that flows in and out of the business. The cash flow statement is good for seeing how much money the company is spending on capital improvements. It also tracks bond and stock sales and repurchases. A company will usually issue a cash flow statement along with its other financial statements.

In the chapters ahead we shall explore in detail the income statement, balance sheet, and cash flow statement entries and indicators that Warren uses to discover whether or not the company in question has a durable competitive advantage that will make him rich over the long run.

CHAPTER 6

Where Warren Goes to Find Financial Information

In the modern age of the Internet there are dozens of places where one can easily find a company's financial statements. The easiest access is through either MSN.com (http://moneycentral.msn.com/investor/home.asp) or Yahoo's Finance web page (www.finance.yahoo.com).

We use both, but Microsoft Network's MSN.com has more detailed financial statements. To begin, find where you type in the symbol for the stock quotes on both sites, then type in the name of the company. Click it when it pops up, and both MSN and Yahoo! will take you to that company's stock quote page. On the left you'll find a heading called "Finance," under which are three hyperlinks that take you to the company's balance sheet, income statement, and cash flow. Above that, under the heading "SEC," is a hyperlink to documents filed with the U.S. Securities and Exchange Commission (SEC). All publicly traded companies must file quarterly finan-

cial statements with the SEC; these are known as 8Qs. Also filed with the SEC is a document called the 10K, which is the company's annual report. It contains the financial statements for the company's accounting or fiscal year. Warren has read thousands of 10Ks over the years, as they do the best job of reporting the numbers without all the fluff that can get stuffed into a shareholders' annual report.

For the hard-core investor Bloomberg.com offers the same services and a lot more, for a fee. But honestly, unless we are buying and selling bonds or currencies, we can get all the financial information we need to build a stock portfolio for free from MSN and Yahoo! And "free" financial information always makes us smile!

THE INCOME STATEMENT

"You have to read a zillion corporate annual reports and their financial statements."

—Warren Buffett

"Some men read Playboy. *I read annual reports."*

—Warren Buffett

CHAPTER 7

Where Warren Starts: The Income Statement

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
Gross Profit	7,000
Operating Expenses	
Selling, General & Admin.	2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
Interest Expense	200
Gain (Loss) Sale Assets	1,275
Other	225
Income Before Tax	1,500
Income Taxes Paid	525
Net Earnings	$975

In his search for the magic company with a durable competitive advantage, Warren always starts with the firm's income statement. Income statements tell the investor the results of the company's operations for a set period of time. Traditionally, they are reported for each three-month period and at the end of the year. Income statements are always labeled for the time period they cover—such as January 1, 2007, to December 31, 2007.

An income statement has three basic components: First, there is the revenue of the business. Then there is the firm's expenses, which are subtracted from the firm's revenue and tell us whether the company earned a profit or had a loss. Sounds simple, doesn't it? It is.

In the early days of stock analysis the leading analysts of the time, such as Warren's mentor Benjamin Graham, focused purely on whether or not the firm produced a profit, and gave little or no attention to the long-term viability of the source of the company's earnings. As we discussed earlier, Graham didn't care if the company was an exceptional business with great economics working in its favor or if it was one of the thousands of mediocre businesses struggling to get by. Graham would buy into a lousy business in a heartbeat if he thought he could get it cheaply enough.

Part of Warren's insight was to divide the world of busi-

nesses into two different groups: First, there were the companies that had a long-term durable competitive advantage over their competitors. These were the businesses which, if he could buy them at a fair or better price, would make him superrich if he held them long enough. The other group was all the mediocre businesses that struggled year after year in a competitive market, which made them poor long-term investments.

In Warren's search for one of these amazing businesses, he realized that the individual components of a company's income statement could tell him whether or not the company possessed the superwealth-creating, long-term durable competitive advantage that he so coveted. Not just whether or not the company made money. But what kind of margins it had, whether it needed to spend a lot on research and development to keep its competitive advantage alive, and whether it needed to use a lot of leverage to make money. These factors comprise the kind of information he mines from the income statement to learn the nature of a company's economic engine. To Warren, the source of the earnings is always more important than the earnings themselves.

For the next fifty chapters we are going to focus on the individual components of a company's financial statement and what Warren is searching for that will tell him if this is the kind of business that will send him into poverty, or the golden business with a long-term durable competitive advantage that will continue to make him one of the richest people in the world.

CHAPTER 8

Revenue: Where the Money Comes In

Income Statement	
($ in millions)	
→ Revenue	$10,000
Cost of Goods Sold	3,000
Gross Profit	$7,000

The first line on the income statement is always total, or gross, revenue. This is the amount of money that came in the door during the period of time in question, which is reported either quarterly or yearly. If we are manufacturing shoes and we sell $120 million worth of shoes in a year, we will report $120 million of total revenue for the year on our yearly income statement.

Now the fact that a company has a lot of revenue doesn't mean that it is earning a profit. To determine if a company is earning a profit, you need to deduct the expenses of the business from its total revenues. Total revenue minus expenses equals net earnings. But the total revenue number by itself tells us nothing until we subtract the expenses and find out what the net earnings are.

After Warren has taken a peek at the total revenues of a business, he starts a long and careful dig through the expenses. Because Warren knows that one of the great secrets to making more money is spending less money.

CHAPTER 9

Cost of Goods Sold: For Warren the Lower the Better

Income Statement	
($ in millions)	
Revenue	$10,000
→ Cost of Goods Sold	3,000
Gross Profit	$7,000

On the income statement, right under the line for Total Revenue comes the Cost of Goods Sold, also known as the Cost of Revenue. The cost of goods sold is either the cost of purchasing the goods the company is reselling or the cost of the materials and labor used in manufacturing the products it is selling. "Cost of revenue" is usually used in place of "cost of goods sold" if the company is in the business of providing

services rather than products. Essentially they are the same thing—but one is a little more encompassing than the other. We should always investigate exactly what the company is including in its calculation of its cost of sales or cost of revenue. This gives us a good idea of how management is thinking about the business.

A simple example of how a furniture company might calculate its cost of goods number would be: Start with the cost of the company's furniture inventory at the beginning of the year; add in the cost of adding to the furniture inventory during the year; and then subtract the cash value of the furniture inventory left at the end of the year. Therefore, if a company starts the year with $10 million in inventory, makes $2 million in purchases to add to the inventory, and ends the period with an inventory whose cost value is $7 million, the company's cost of goods for the period would be $5 million.

Although the cost of goods sold, as a lone number, doesn't tell us much about whether the company has a durable competitive advantage or not, it is essential in determining the Gross Profit of the business, which is a key number that helps Warren determine whether or not the company has a long-term competitive advantage. We discuss this further in the next chapter.

CHAPTER 10

Gross Profit/Gross Profit Margin: Key Numbers for Warren in His Search for Long-Term Gold

Income Statement	
($ in millions)	
→ Revenue	$10,000
Cost of Goods Sold	3,000
→ Gross Profit	$7,000

Gross Profit $7,000 ÷ Revenue $10,000 = Gross Profit Margin 70%

Now if we subtract from the company's total revenue the amount reported as its Cost of Goods Sold, we get the company's reported Gross Profit. An example: total revenue of $10 million less cost of goods sold of $7 million equals a gross profit of $3 million.

Gross profit is how much money the company made off of total revenue after subtracting the costs of the raw goods and the labor used to make the goods. It doesn't include such categories as sales and administrative costs, depreciation, and the interest costs of running the business.

By itself, gross profit tells us very little, but we can use this number to calculate the company's gross profit margin, which can tell us a lot about the economic nature of the company.

The equation for determining gross profit margin is:

Gross Profit ÷ Total Revenues = Gross Profit Margin

Warren's perspective is to look for companies that have some kind of durable competitive advantage—businesses that he can profit from over the long run. What he has found is that companies that have excellent long-term economics working in their favor tend to have **consistently** higher gross profit margins than those that don't. Let me show you:

The gross profit margins of companies that Warren has already identified as having a durable competitive advantage include: Coca-Cola, which shows a consistent gross profit margin of 60% or better; the bond rating company Moody's, 73%; the Burlington Northern Santa Fe Railway, 61%; and the very chewable Wrigley Co., 51%.

Contrast these excellent businesses with several companies we know that have poor long-term economics, such as the

in-and-out-of-bankruptcy United Airlines, which shows a gross profit margin of 14%; troubled auto maker General Motors, which comes in at a weak 21%; the once troubled, but now profitable U.S. Steel, at a not-so-strong 17%; and Goodyear Tire—which runs in any weather, but in a bad economy is stuck at a not-very-impressive 20%.

In the tech world—a field Warren stays away from because he doesn't understand it—Microsoft shows a consistent gross profit margin of 79%, while Apple Inc. comes in at 33%. These percentages indicate that Microsoft produces better economics selling operating systems and software than Apple does selling hardware and services.

What creates a high gross profit margin is the company's durable competitive advantage, which allows it the freedom to price the products and services it sells well in excess of its cost of goods sold. Without a competitive advantage, companies have to compete by lowering the price of the product or service they are selling. That drop, of course, lowers their profit margins and therefore their profitability.

As a very general rule (and there are exceptions): Companies with gross profit margins of 40% or better tend to be companies with some sort of durable competitive advantage. Companies with gross profit margins below 40% tend to be companies in highly competitive industries, where competition is hurting overall profit margins (there are exceptions here, too). Any gross profit margin of 20% and below is usually a

good indicator of a fiercely competitive industry, where no one company can create a sustainable competitive advantage over the competition. And a company in a fiercely competitive industry, without some kind of competitive advantage working in its favor, is never going to make us rich over the long run.

While the gross profit margin test is not fail-safe, it is one of the early indicators that the company in question has some kind of consistent durable competitive advantage. Warren strongly emphasizes the word "durable," and to be on the safe side we should track the annual gross profit margins for the last ten years to ensure that the "consistency" is there. Warren knows that when we look for companies with a durable competitive advantage, "consistency" is the name of the game.

Now there are a number of ways that a company with a high gross profit margin can go astray and be stripped of its long-term competitive advantage. One of these is high research costs, another is high selling and administrative costs, and a third is high interest costs on debt. Any one of these three costs can destroy the long-term economics of the business. These are called operating expenses, and they are the thorn in the side of every business.

CHAPTER 11

Operating Expenses: Where Warren Keeps a Careful Eye

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
Gross Profit	7,000
→ Operating Expenses	
Selling, General & Admin.	2,100
Research & Development	1,000
Depreciation	700
Operating Profit	$3,200

Right beneath the line on the income statement for gross profit comes a group of expenses called operating expenses.

These are all the company's hard costs associated with research and development of new products, selling and administrative costs of getting the product to market, depreciation and amortization, restructuring and impairment charges, and the catch-all "other" that includes all non-operating, non-recurring expenses.

When these entries are added, they make up the company's total operating expenses, which are then subtracted from the gross profit to give us the firm's operating profit or loss. Since these entries all have an impact on the long-term economic nature of the business, it is best if we spend the next couple of chapters going through them one by one in true Warren fashion.

CHAPTER 12

Selling, General, and Administrative Expenses

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
Gross Profit	7,000
Operating Expenses	
→ Selling, General & Admin.	2,100
Research & Development	1,000
Interest	700
Operating Profit	$3,200

On the income statement under the heading of Selling, General & Administrative (SGA) Expenses is where the com-

pany reports its costs for direct and indirect selling expenses and all general and administrative expenses incurred during the accounting period. These include management salaries, advertising, travel costs, legal fees, commissions, all payroll costs, and the like.

With a company like Coca-Cola, these expenses run into the billions and have a tremendous impact on the company's bottom line. As a percentage of gross profit, they vary greatly from business to business. They even vary with companies like Coca-Cola that have a durable competitive advantage. Coca-Cola consistently spends on average 59% of its gross profit on SGA expenses. A company like Moody's consistently spends on average 25%, and Procter & Gamble consistently spends right around 61%. "Consistently" is the key word.

Companies that don't have a durable competitive advantage suffer from intense competition and show wild variation in SGA costs as a percentage of gross profit. GM, over the last five years, has gone from spending 28% to 83% of its gross profits on SGA costs. Ford, over the last five years, has been spending 89% to 780% of its gross profits on SGA expenses, which means that they are losing money like crazy. What happens is that sales start to fall, which means revenues fall, but SGA costs remain. If the company can't cut SGA costs fast enough, they start eating into more and more of the company's gross profits.

In the search for a company with a durable competitive

advantage the lower the company's SGA expenses, the better. If they can stay consistently low, all the better. In the world of business anything under 30% is considered fantastic. However, there are a number of companies with a durable competitive advantage that have SGA expenses in the 30% to 80% range. But if we see a company that is repetitively showing SGA expenses close to, or in excess of, 100%, we are probably dealing with a company in a highly competitive industry where no one entity has a sustainable competitive advantage.

There are also companies with low to medium SGA expenses that destroy great long-term business economics with high research and development costs, capital expenditures, and/or interest expense on their debt load.

Intel is a perfect example of a company that has a low ratio of SGA expenses to gross profit, but that because of high research and development costs has seen its long-term economics reduced to just average. Yet if Intel stopped doing research and development, its current batch of products would be obsolete within ten years and it would have to go out of business.

Goodyear Tire has a 72% ratio of SGA expenses to gross profit, but its high capital expenditures and interest expense—from the debt used to finance its capital expenditures—are dragging the tire maker into the red every time there is a recession. But if Goodyear didn't add the debt to make all those capital expenditures/improvements, it wouldn't stay competitive for very long.

Warren has learned to steer clear of companies cursed with consistently high SGA expenses. He also knows that the economics of companies with low SGA expenses can be destroyed by expensive research and development costs, high capital expenditures, and/or lots of debt. He avoids these kinds of businesses regardless of the price, because he knows that their inherent long-term economics are so poor that even a low asking price for the stock will not save investors from a lifetime of mediocre results.

CHAPTER 13

Research and Development: Why Warren Stays Away from It

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
→ Gross Profit	7,000
Operating Expenses	
Selling, General & Admin.	2,100
→ Research & Development	1,000
Depreciation	700
Operating Profit	$3,200

This is a big one in the game of identifying companies with a durable competitive advantage. What seems like a long-term

competitive advantage is often an advantage bestowed upon the company by a patent or some technological advancement. If the competitive advantage is created by a patent, as with the pharmaceutical companies, at some point in time that patent will expire and the company's competitive advantage will disappear.

If the competitive advantage is the result of some technological advancement, there is always the threat that newer technology will replace it. This is why Microsoft is so afraid of the technological advancements of Google. Today's competitive advantage may end up becoming tomorrow's obsolescence.

Not only must these companies spend huge sums of money on R&D, but because they are constantly having to invent new products they must also redesign and update their sales programs, which means that they also have to spend heavily on selling and administrative costs. Consider this: Merck must spend 29% of its gross profit on R&D and 49% of its gross profit on selling, general, and administrative costs (SGA), which, when combined, eat up a total 78% of its gross profit. What's more, if Merck & Co. fails to invent the next new multibillion-dollar-selling drug, it loses its competitive advantage when its existing patents expire.

Intel, while the leader in its fast-paced field, must consistently spend approximately 30% of its gross profit on R&D expenses; if it doesn't, it will lose its competitive advantage within just a few years.

Moody's, the bond rating company, is a long-time Warren favorite, with good reason. Moody's has no R&D expense, and on average spends only 25% of its gross profit on SGA expenses. Coca-Cola, which also has no R&D costs, but has to advertise like crazy, still, on average, spends only 59% of its gross profit on SGA costs. With Moody's and Coca-Cola, Warren doesn't have to lie awake at night worrying that some drug patent is going to expire or that his company won't win the race to the next technological breakthrough.

Here then is Warren's rule: Companies that have to spend heavily on R&D have an inherent flaw in their competitive advantage that will always put their long-term economics at risk, which means they are not a sure thing.

And if it is not a sure thing, Warren is not interested.

CHAPTER 14

Depreciation: A Cost Warren Can't Ignore

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
→ Gross Profit	7,000
Operating Expenses	
Selling, General & Admin.	2,100
Research & Development	1,000
→ Depreciation	700
Operating Profit	$3,200

All machinery and buildings eventually wear out over time; this wearing out is recognized on the income statement as depreciation. Basically, the amount that something depreci-

ates in a given year is a cost that is allocated against income for that year. This makes sense: The amount by which the asset depreciated can arguably be said to have been used in the company's business activity of the year that generated the income.

An example: Imagine that a million-dollar printing press is bought by XYZ Printing Corporation. This printing press has a life span of ten years. Because it has a life span of ten years, the Internal Revenue Service will not let the company expense the entire $1 million cost in the year that it was purchased. Instead, the press must be expensed over the ten years that it is in service. A ten-year life span and an original cost of $1 million will mean that XYZ will depreciate the printing press at a rate of $100,000 a year. Depreciation is a real cost of doing business, because at some time in the future, the printing press will have to be replaced.

The buying of the printing press will—on the balance sheet—cause $1 million to come out of cash and $1 million to be added to plant and equipment. Then, for the next ten years, the depreciated cost of $100,000 a year will show up on the income statement as an expense. On the balance sheet each year, $100,000 will be subtracted from the plant and equipment asset account and $100,000 added to the accumulated depreciation liability account. The actual $1 million cash outlay for the printing press will show up on the cash flow statement under capital expenditures. We would like to emphasize that the million-dollar expense for the printing press is not

taken in the year that it is bought; rather it is allocated as a depreciation expense to the income statement, in $100,000 increments, over a ten-year period.

A neat trick that Wall Street financial types have figured out is that once the printing press is bought and paid for, the $100,000 yearly depreciation expense doesn't take any more additional cash outlays, but it does decrease earnings that are reported to the IRS every year for the next ten years. This means that, from a short-term perspective, XYZ has a yearly cost that in reality isn't costing it any additional outlays of cash. Thus, the Wall Street financial types can add that $100,000 cost back into earnings, which means that the cash flow of the business can now support more debt for such fun money-making ventures as leveraged buyouts. Wall Street has an acronym for this earnings recalculation: They call it EBITDA—meaning Earnings Before Income Tax, Depreciation, and Amortization.

Warren says that by using EBITDA our clever Wall Street types are ignoring that eventually the printing press will wear out and the company will have to come up with another $1 million to buy a new one. But now the company is saddled with a ton of debt left over from the leveraged buyout and might not have the ability to finance the $1 million purchase of a new printing press.

Warren believes that depreciation is a very real expense and should always be included in any calculation of earnings.

To do otherwise would be to delude ourselves over the short-term into believing that business is earning more than it actually is. And one does not get rich off delusions.

What Warren has discovered is that companies that have a durable competitive advantage tend to have lower depreciation costs as a percentage of gross profit than companies that have to suffer the woes of intense competition. As an example, Coca-Cola's depreciation expense consistently runs about 6% of its gross profits, and Wrigley's, another durable competitive advantage holder, also runs around 7%. And Procter & Gamble, another long-time Warren favorite, comes in at approximately 8%. Contrast the case of GM, which is in a highly competitive capital-intensive business. Its depreciation expense runs anywhere from 22% to 57% of its gross profits.

As with any expense that eats into a company's gross profits, Warren has found that less always means more—when it comes to increasing the bottom line.

CHAPTER 15

Interest Expense: What Warren Doesn't Want

Income Statement	
($ in millions)	
Revenue	$10,000
Cost of Goods Sold	3,000
→ Gross Profit	7,000
Operating Expenses	
Selling, General & Admin.	2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
→ Interest Expense	$200

Interest Expense is the entry for the interest paid out, during the quarter or year, on the debt the company carries on its bal-

ance sheet as a liability. While it is possible for a company to be earning more in interest than it is paying out, as with a bank, the vast majority of manufacturing and retail businesses pay out far more in interest than they earn.

This is called a financial cost, not an operating cost, and it is isolated out on its own, because it is not tied to any production or sales process. Instead, interest is reflective of the total debt that the company is carrying on its books. The more debt the company has, the more interest it has to pay.

Companies with high interest payments relative to operating income tend to be one of two types: a company that is in a fiercely competitive industry, where large capital expenditures are required for it to stay competitive, or a company with excellent business economics that acquired the debt when the company was bought in a leveraged buyout.

What Warren has figured out is that companies with a durable competitive advantage often carry little or no interest expense. Long-term competitive advantage holder Procter & Gamble has to pay a mere 8% of its operating income out in interest costs; the Wrigley Co. has to pay an average 7%; contrast those two companies with Goodyear, which is in the highly competitive and capital-intensive tire business. Goodyear has to pay, on average, 49% of its operating income out in interest payments.

Even in highly competitive businesses like the airline industry, the amount of the operating income paid out in inter-

est can be used to identify companies with a competitive advantage. The consistently profitable Southwest Airlines pays just 9% of operating income in interest payments, while its in-and-out-of-bankruptcy competitor United Airlines pays 61% of its operating income out in interest payments. Southwest's other troubled competitor, American Airlines, pays a whopping 92% of its operating income out in interest payments.

As a rule, Warren's favorite durable competitive advantage holders in the consumer products category all have interest payouts of less than 15% of operating income. But be aware that the percentage of interest payments to operating income varies greatly from industry to industry. As an example: Wells Fargo, a bank in which Warren owns a 14% stake, pays out approximately 30% of its operating income in interest payments, which seems high compared with Coke's, but actually makes the bank, out of America's top five, the one with the lowest and most attractive ratio. Wells Fargo is also the only one with a AAA rating from Standard & Poor's.

The ratio of interest payments to operating income can also be very informative as to the level of economic danger that a company is in. Take the investment banking business, which on average makes interest payments in the neighborhood of 70% of its operating income. A careful eye would have picked up the fact that in 2006 Bear Stearns reported that it was paying out 70% of its operating income in interest payments, but that by the quarter that ended in November 2007,

its percentage of interest payments to operating income had jumped to 230%. This means that it had to dip into its shareholders' equity to make up the difference. In a highly leveraged operation like Bear Stearns, that spelled disaster. By March of 2008 the once mighty Bear Stearns, whose shares had traded as high as $170 the year before, was being forced to merge with JP Morgan Chase & Co. for a mere $10 a share.

The rule here is real simple: In any given industry the company with the lowest ratio of interest payments to operating income is usually the company most likely to have the competitive advantage. In Warren's world, investing in the company with a durable competitive advantage is the only way to ensure that we are going to get rich over the long-term.

CHAPTER 16

Gain (or Loss) on Sale of Assets and Other

Income Statement	
($ in millions)	
Operating Expenses	
Selling, General & Admin.	$2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
Interest Expense	200
→ Gain (Loss) Sale Assets	1,275
→ Other	225

When a company sells an asset (other than inventory), the profit or loss for the sale is recorded under Gain (or Loss) on

Sale of Assets. The profit is the difference between the proceeds from the sale and the carrying amount shown on the company's books. If the company had a building that it paid $1 million for, and after depreciating it down to $500,000, sold it for $800,000, the company would record a gain of $300,000 on the sale of the asset. Likewise, if the building sold for $400,000, the company would record a loss of $100,000.

The same thing applies to the entry "Other." This is where non-operating, unusual, and infrequent income and expense events are netted out and entered onto the income statement. Such events would include the sale of fixed assets, such as property, plant, and equipment. Also included under "Other" would be licensing agreements and the sale of patents, if they were categorized as outside the normal course of business.

Sometimes these nonrecurring events can significantly add to a company's bottom line. Since these *are* nonrecurring events, Warren believes that they should be removed from any calculation of the company's net earnings in determining whether or not the company has a durable competitive advantage.

CHAPTER 17

Income Before Tax: The Number That Warren Uses

Income Statement	
($ in millions)	
Operating Expenses	
Selling, General & Admin.	$2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
Interest Expense	200
Gain (Loss) Sale Assets	1,275
Other	225
→ Income Before Tax	$1,500

"Income before tax" is a company's income after all expenses have been deducted, but before income tax has been sub-

tracted. It is also the number that Warren uses when he is calculating the return that he is getting when he buys a whole business, or when he buys a partial interest in a company through the open-market purchase of its shares.

With the exception of tax-free investments, all investment returns are marketed on a pre-tax basis. And since all investments compete with each other, it is easier to think about them if they are thought about in equal terms.

When Warren bought $139 million worth of tax-free bonds in Washington Public Power Supply System (WPPSS), which paid him $22.7 million a year in tax-free interest, he reasoned that an after-tax $22 million was the same as earning a pre-tax $45 million. To buy a business that would earn him a pre-tax $45 million would cost him $250 million to $300 million. Thus, he viewed the WPPSS bonds as a business that he was buying at a 50% discount, relative to the value of what other businesses with similar economics were selling for.

Warren has always discussed the earnings of a company in pre-tax terms. This enables him to think about a business or investment in terms relative to other investments. It is also one of the cornerstones of his revelation that a company with a durable competitive advantage is actually a kind of "equity bond," with an expanding coupon or interest rate. We shall explore his "equity bond" theory in much greater detail toward the end of the book.

CHAPTER 18

Income Taxes Paid: How Warren Knows Who Is Telling the Truth

Income Statement	
($ in millions)	
Operating Expenses	
Selling, General & Admin.	$2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
Interest Expense	200
Gain (Loss) Sale Assets	1,275
Other	225
Income Before Tax	1,500
→ Income Taxes Paid	$525

Just like every other taxpayer, American corporations have to pay taxes on their income. Today, in America, that amount

is approximately 35% of their income. When taxes are paid, they are recorded on the income statement under the heading Income Taxes Paid.

Now what is interesting about Income Taxes Paid is that the line item reflects the company's true pre-tax earnings. Sometimes, companies like to tell the world that they are making more money than they actually are. (Shocking, isn't it?) One of the ways to see if they are telling the truth is to look at the documents they file with the SEC and see what they are paying in income taxes. Take the number they list as pre-tax operating income and deduct 35% from it. If the remainder doesn't equal the amount the company reported as income taxes paid, we had better start asking some questions.

Warren has learned over the years that companies that are busy misleading the IRS are usually hard at work misleading their shareholders as well. The beauty of a company with a long-term competitive advantage is that it makes so much money it doesn't have to mislead anyone to look good.

CHAPTER 19

Net Earnings: What Warren Is Looking For

Income Statement	
($ in millions)	
Operating Expenses	
Selling, General & Admin.	$2,100
Research & Development	1,000
Depreciation	700
Operating Profit	3,200
Interest Expense	200
Gain (Loss) Sale Assets	1, 275
Other	225
Income Before Tax	1,500
Income Taxes Paid	525
→ Net Earnings	$975

After all the expenses and taxes have been deducted from a company's revenue, we get the company's net earnings. This

is where we find out how much money the company made after it paid income taxes. There are a couple of concepts that Warren uses when he looks at this number that help him determine whether the company has a durable competitive advantage, so why don't we start there.

First on Warren's list is whether or not the net earnings are showing a historical upward trend. A single year's entry for net earnings is worthless to Warren; he is interested in whether or not there is consistency in the earnings picture and whether the long-term trend is upward—both of which can be equated to "durability" of the competitive advantage. For Warren the ride doesn't have to be smooth, but he is after a historical upward trend.

But note: Because of share repurchase programs it is possible that a company's historical net earnings trend may be different from its historical per-share earnings trend. Share repurchase programs will increase per-share earnings by decreasing the number of shares outstanding. If a company reduces the number of shares outstanding, it will decrease the number of shares being used to divide the company's net earnings, which in turn increases per-share earnings even though actual net earnings haven't increased. In extreme examples the company's share repurchase program can even cause an increase in per-share earnings, while the company is experiencing an actual decrease in net earnings.

Though most financial analysis focuses on a company's

per-share earnings, Warren looks at the business's net earnings to see what is actually going on.

What he has learned is that companies with a durable competitive advantage will report a higher percentage of net earnings to total revenues than their competitors will. Warren has said that given the choice between owning a company that is earning $2 billion on $10 billion in total revenue, or a company earning $5 billion on $100 billion in total revenue, he would choose the company earning the $2 billion. This is because the company with $2 billion in net earnings is earning 20% on total revenues, while the company earning $5 billion is earning only 5% on total revenues.

So, while the total revenue number alone tells us very little about the economics of the business, its ratio to net earnings can tell us a lot about the economics of the business compared with other businesses.

A fantastic business like Coca-Cola earns 21% on total revenues, and the amazing Moody's earns 31%, which reflects these companies' superior underlying business economics. But a company like Southwest Airlines earns a meager 7%, which reflects the highly competitive nature of the airline business, in which no one airline holds a long-term competitive advantage over its peers. In contrast, General Motors, in even a great year—when it isn't losing money—earns only 3% on total revenue. This is indicative of the lousy economics inherent in the supercompetitive auto industry.

A simple rule (and there are exceptions) is that if a company is showing a net earnings history of more than 20% on total revenues, there is a real good chance that it is benefiting from some kind of long-term competitive advantage. Likewise, if a company is consistently showing net earnings under 10% on total revenues it is—more likely than not—in a highly competitive business in which no one company holds a durable competitive advantage. This of course leaves an enormous gray area of companies that earn between 10% and 20% on total revenue, which is just packed with businesses ripe for mining long-term investment gold that no one has yet discovered.

One of the exceptions to this rule is banks and financial companies, where an abnormally high ratio of net earnings to total revenues usually means a slacking-off in the risk management department. While the numbers look enticing, they actually indicate an acceptance of greater risk for easier money, which in the game of lending money is usually a recipe for making quick money at the cost of long-term disaster. And having financial disasters is not how one gets rich.

CHAPTER 20

Per-Share Earnings: How Warren Tells the Winners from the Losers

Per-share earnings are the net earnings of the company on a per-share basis for the time period in question. This is a big number in the world of investing because, as a rule, the more a company earns per share the higher its stock price is. To determine the company's per-share earnings we take the amount of net income the company earned and divide it by the number of shares it has outstanding. As an example: If a company had net earnings of $10 million for the year, and it has one million shares outstanding, it would have per-share earnings for the year of $10 a share.

While no one yearly per-share figure can be used to identify a company with a durable competitive advantage, a per-share earnings figure for a ten-year period can give us a very clear picture of whether the company has a long-term competitive advantage working in its favor. What Warren looks for is

a per-share earning picture over a ten-year period that shows consistency and an upward trend.

Something that looks like this:

08	$2.95
07	$2.68
06	$2.37
05	$2.17
04	$2.06
03	$1.95
02	$1.65
01	$1.60
00	$1.48
99	$1.30
98	$1.42

This shows Warren that the company has consistent earnings with a long-term upward trend—an excellent sign that the company in question has some kind of long-term competitive advantage working in its favor. Consistent earnings are usually a sign that the company is selling a product or mix of products that don't need to go through the expensive process of change. The upward trend in earnings means that the company's economics are strong enough to allow it either to make the expenditures to increase market share through advertising or expansion, or to use financial engineering like stock buybacks.

• • •

The companies that Warren stays away from have an erratic earnings picture that looks like this:

08	$2.50
07	$(0.45) loss
06	$3.89
05	$(6.05) loss
04	$6.39
03	$5.03
02	$3.35
01	$1.77
00	$6.68
99	$8.53
98	$5.24

This shows a downward trend, punctuated by losses, which tells Warren that this company is in a fiercely competitive industry prone to booms and busts. The booms show up when demand is greater than supply, but when demand is great, the company increases production to meet demand, which increases costs and eventually leads to an excess of supply in the industry. Excess leads to falling prices, which means that the company loses money until the next boom comes along. There are thousands of companies like this, and the wild price swings in shares, caused by each company's erratic earnings, create the illusion of buying opportunities for traditional value investors. But what they are really buying is a long, slow boat ride to investor nowhere.

BALANCE SHEET

"One of the things you will find—which is interesting and people don't think of it enough—with most businesses and with most individuals, is life tends to snap you at your weakest link. The two biggest weak links in my experience: I've seen more people fail because of liquor and leverage—leverage being borrowed money."

—Warren Buffett

CHAPTER 21

Balance Sheet in General

One of the first things Warren does when he is trying to figure out if a company has a durable competitive advantage or not is to go and see how much the company has in assets—think cash and property—and how much money it owes to vendors, the banks, and the bondholders. To do this, he looks at the company's balance sheet.

Balance sheets, unlike income statements, are only for a set date. There is no such thing as a balance sheet for the year or quarter. We can create a balance sheet for any day of the year, but it will only be for that specific date. A company's accounting department will generate a balance sheet at the end of each fiscal quarter. Think of it as a snapshot of the company's financial condition on the particular date that the balance sheet is generated.

Now a balance sheet is broken into two parts: The first part is all the assets, and there are many different kinds of assets. They include cash, receivables, inventory, property, plant, and equipment.

The second part of the balance sheet is liabilities and shareholder equity.

Under liabilities we find two different categories of liabilities: Current Liabilities and Long-Term Liabilities. "Current liabilities" means the money that is owed within the year, which includes Cash and Short-Term Investments, Total Inventory, Total Receivables, and Prepaid Expenses.

Long-term liabilities are those that come due in one year or more, and include the money owed to the vendors that sold us goods, unpaid taxes, bank loans, and bond loans.

Warren, in his search for companies with a durable competitive advantage, is looking for certain things in each category of assets and liabilities, which we will get to a little later on in the book.

Now if we take all the assets and subtract all the liabilities, we will get the net worth of the business, which is the same as shareholders' equity. As an example: If the business had assets worth $100K and liabilities of $25K, then the business would have a net worth or shareholders' equity of $75K. But if the business had assets worth $100K and liabilities of $175K, the business would have negative net worth, or negative shareholders' equity, of $75K.

Assets minus Liabilities = Net Worth or Shareholders' Equity

Okay, that is the end of the balance sheet primer, so let's jump in and see how Warren uses the balance sheet and all of

its subcategories to identify a company that has a durable competitive advantage over its competitors.

Balance Sheet

($ in millions)

Assets	
Cash & Short-Term Investments	$4,208
Total Inventory	2,220
Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
Other Assets	0
Total Assets	$43,059

Liabilities	
Accounts Payable	$1,380
Accrued Expenses	5,535
Short-Term Debt	5,919
Long-Term Debt Due	133
Other Current Liabilities	258
Total Current Liabilities	13,225
Long-Term Debt	3,277
Deferred Income Tax	1,890
Minority Interest	0
Other Liabilities	3,133
Total Liabilities	21,525
Shareholders' Equity	
Preferred Stock	0
Common Stock	880
Additional Paid in Capital	7,378
Retained Earnings	36,235
Treasury Stock—Common	−23,375
Other Equity	626
Total Shareholders' Equity	21,744
Total Liabilities & Shareholders' Equity	$43,269

CHAPTER 22

ASSETS

Balance Sheet/Assets	
($ in millions)	
Cash & Short-Term Investments	$4,208
Total Inventory	2,220
Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
Other Assets	0
Total Assets	$43,059

This is where all the goodies are kept: the cash, the plant and equipment, the patents, and all the stuff that riches are made of. They are found on the company's balance sheet under the heading Assets.

On the balance sheet, accounting types long ago divided Corporate Assets into two distinct groups: Current Assets, and All Other Assets.

Current Assets is made up of "cash and cash equivalents," "short-term investments," "net receivables," "inventory," and a general slush fund called "other assets." These are called current assets because they are cash, or they can be or will be converted into cash in a very short period of time (usually within a year). As a rule, they are listed on the balance sheet in order of their liquidity (which means how quickly they can be turned into cash). Historically, current assets have also been called quick, liquid, or floating assets. What is important about them is their availability to be turned into cash and spent should the business economics of the enterprise start to erode and other sources of day-to-day operating capital start to evaporate. (If you can't imagine sources of operating capital evaporating overnight, just think Bear Stearns.)

All other assets are those that aren't current, which means that they will not or cannot be converted into cash in the year ahead; they are listed in a separate category immediately under

Current Assets. In this category go Long-Term Investments, Property Plant and Equipment, Goodwill, Intangible Assets, Accumulated Amortization, Other Assets, and Deferred Long-Term Asset Charges.

Collectively these two groups of assets make up the company's total assets. Individually and collectively, via their quality and quantity, they tell Warren a great many things about the economic character of a business and whether or not it possesses the coveted durable competitive advantage that will make him superrich.

This is why we are going to spend the next couple of chapters discussing the individual asset classes and how Warren uses them to identify a company with the durable competitive advantage.

So let's take a look at the categories and see how we can use them individually and collectively to help us identify the exceptional business with a long-term competitive advantage working in its favor.

CHAPTER 23

Current Asset Cycle: How the Money Is Made

Balance Sheet/Assets	
($ in millions)	
→ Cash & Short-Term Investments	$4,208
→ Total Inventory	2,220
→ Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	$12,005

Current assets are also referred to as the "working assets" of the business because they are in the cycle of cash going to buy inventory; Inventory is then sold to vendors and becomes Accounts Receivable. Accounts Receivable, when collected

from the vendors, then turns back into Cash. Cash → Inventory → Accounts Receivable → Cash. This cycle repeats itself over and over again, and it is how a business makes money.

The different elements of the current asset cycle can tell Warren a great deal about the economic nature of the business and whether or not it has a durable competitive advantage in the marketplace.

CHAPTER 24

Cash and Cash Equivalents: Warren's Pile of Loot

Balance Sheet/Assets	
($ in millions)	
→ Cash & Short-Term Investments	$4,208
→ Total Inventory	2,220
→ Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	$12,005

One of the first things Warren does is to look at the assets to see how much cash and cash equivalents a company has. This asset is exactly what it says it is—cash—or it is the equivalent of cash, such as a short-term CD at the bank, three-

month Treasuries, or other highly liquid assets. A high number for cash or cash equivalents tells Warren one of two things—that a company has a competitive advantage that is generating tons of cash, which is a good thing, or that it has just sold a business or a ton of bonds, which may not be a good thing. A low amount or the lack of a stockpile of cash usually means that the company has poor or mediocre economics. To figure out which is which, let's look a little deeper at the asset of cash.

Companies traditionally keep a hoard of cash to support business operations. Think of it as a very large checkbook. But if we are earning more than we are spending, the cash starts to pile up and that creates the investment problem of what to do with all the excess cash. Which is a lovely problem to have.

Since cash earns a low rate of return in a bank account or CD, it is better to employ the cash assets in business operations or investments that produce a higher rate of return. What do you want to own? A short-term CD that is earning 4% on your invested money, or an apartment house that will earn you 20% on your investment? You take the apartment house. The same thing goes on in a business. The money comes in the door, and if it comes in faster than operating costs can spend it, it starts to pile up; as it piles up, the company has to decide what to do with it. Traditionally, companies have used excess cash to expand operations, buy entirely new businesses, invest in partially owned businesses via the stock mar-

ket, buy back their shares, or pay out a cash dividend to shareholders. But quite often they simply sock it away for a rainy day. One can never be too financially prepared in our constantly changing and challenging world.

A company basically has three ways of creating a large stockpile of cash. It can sell new bonds or equity to the public, which creates a stockpile of cash before it is put to use. It can also sell an existing business or other assets that the company owns, which can also create a stockpile of cash before the company finds other uses for it. Or it has an ongoing business that generates more cash than the business burns. It is this scenario of a large stockpile of cash created by an ongoing business that really grabs Warren's attention. Because a company that has a surplus of cash as the result of ongoing business is often a company that has some kind of durable competitive advantage working in its favor.

When Warren is looking at a company that is suffering a short-term business problem, and causing shortsighted Wall Street to bear down on the company's shares, Warren will look at the cash or marketable securities that the company has hoarded away to give him an idea whether it has the financial strength to weather the troubles it has gotten itself into.

So here is the rule: If we see a lot of cash and marketable securities and little or no debt, chances are very good that the business will sail on through the troubled times. But if the company is hurting for cash and is sitting on a mountain of

debt, it probably is a sinking ship that not even the most skilled manager can save.

A simple test to see exactly what is creating all the cash is to look at the past seven years of balance sheets. This will reveal whether the cash hoard was created by a one-time event, such as the sale of new bonds or shares, or the sale of an asset or an existing business, or whether it was created by ongoing business operations. If we see lots of debt, we probably aren't dealing with an exceptional business. But if we see a ton of cash piling up and little or no debt, and no sales of new shares or assets, and we also note a history of consistent earnings, we're probably seeing an excellent business with the durable competitive advantage that Warren is searching for—the kind of company that will make us rich over the long-term.

Lest we forget, cash is king when troubled times hit, so if we have it when our competitors don't, we get to rule.

And getting to rule is all that it is cracked up to be.

CHAPTER 25

Inventory: What the Company Needs to Buy and What the Company Needs to Sell

Balance Sheet/Assets	
($ in millions)	
Cash & Short-Term Investments	$4,208
→ Total Inventory	2,220
Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	$12,005

Inventory is the company's products that it has warehoused to sell to its vendors. Since a balance sheet is always for a specific day, the amount found on the balance sheet for inventory is the value of the company's inventory for that date.

With a lot of businesses, there is a risk of inventory becoming obsolete. But as we have discussed earlier, manufacturing companies with a durable competitive advantage have an advantage, in that the products they sell never change and therefore never become obsolete. This is an advantage Warren wants to see.

When trying to identify a manufacturing company with a durable competitive advantage, look for an inventory and net earnings that are on a corresponding rise. This indicates that the company is finding profitable ways to increase sales, and that increase in sales has called for an increase in inventory, so the company can fulfill orders on time.

Manufacturing companies with inventories that rapidly ramp up for a few years and then, just as rapidly, ramp down, are more likely than not companies caught in highly competitive industries subject to booms and busts. And no one ever got rich going bust.

CHAPTER 26

Net Receivables: Money Owed to the Company

Balance Sheet/Assets	
($ in millions)	
Cash & Short-Term Investments	$4,208
Total Inventory	2,220
→ Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
Total Current Assets	$12,005

When a company sells its products to a purchaser, it does so on the basis of either cash up front or payment due thirty days after the purchaser receives the goods. In some businesses the cash isn't due for even longer periods. Sales in this state of limbo, where the cash is due, are called receivables. This is

money that is owed the company. Since a certain percentage of purchasers that were sold goods will not pay, an estimated amount for bad debts is deducted from the Receivables, which gives us Net Receivables.

Receivables less Bad Debts equals Net Receivables.

Net Receivables as a stand-alone number tells us very little about the company's long-term competitive advantage. However, it does tell us a great deal about different companies within the same industry. In very competitive industries, some companies will attempt to gain an advantage by offering better payment terms—instead of 30 days, they may give vendors 120 days. This will cause an increase in sales and an increase in receivables.

If a company is consistently showing a lower percentage of Net Receivables to Gross Sales than its competitors, it usually has some kind of competitive advantage working in its favor that the others don't have.

CHAPTER 27

Prepaid Expenses/Other Current Assets

Balance Sheet/Assets	
($ in millions)	
Cash & Short-Term Investments	$4,208
Total Inventory	2,220
Total Receivables, Net	3,317
→ Prepaid Expenses	2,260
→ Other Current Assets, Total	0
Total Current Assets	$12,005

Businesses sometimes pay for goods and services that they will receive in the near future, although they have not yet taken possession of the goods or received the benefits of the service. Even though the goods or services have not been

received, they are paid for, so they are assets of the business. They are noted as current assets in the account for prepaid expenses. Insurance premiums for the year ahead, which are paid in advance, would be one such prepaid expense. Prepaid expenses offer us little information about the nature of the business, or about whether it is benefiting from having a durable competitive advantage.

Other current assets are non-cash assets that are due within the year but are not as yet in the company's hands. These include such things as deferred income tax recoveries, which are due within the year, but aren't cash in hand just yet.

CHAPTER 28

Total Current Assets and the Current Ratio

Balance Sheet/Assets	
($ in millions)	
Cash & Short-Term Investments	$4,208
Total Inventory	2,220
Total Receivables, Net	3,317
Prepaid Expenses	2,260
Other Current Assets, Total	0
→ Total Current Assets	$12,005

Total Current Assets is a number that has long played an important role in financial analysis. Analysts have traditionally argued that subtracting a company's current liabilities from its current assets gives them an idea whether the com-

pany can meet its short-term debt obligations. They developed the current ratio, which is derived by dividing current assets by current liabilities; the higher the ratio is, the more liquid the company. A current ratio of over one is considered good, and anything below one bad. If it is below one, it is believed that the company may have a hard time meeting its short-term obligations to its creditors.

The funny thing about a lot of companies with a durable competitive advantage is that quite often their current ratio is below the magical one. Moody's comes in at .64, Coca-Cola at .95, Procter & Gamble at .82, and Anheuser-Busch at .88. Which, from an old-school perspective, means that these companies might have difficulties paying current liabilities. What is really happening is that their earning power is so strong they can easily cover their current liabilities. Also, as a result of their tremendous earning power, these companies have no problem tapping into the cheap, short-term commercial paper market if they need any additional short-term cash.

Because of their great earning power, they can also pay out generous dividends and make stock repurchases, both of which diminish cash reserves and help pull their current ratios below one. But it is the consistency of their earning power, which comes with having a durable competitive advantage, that ensures they can cover their current liabilities and not fall prey to the vicissitudes of business cycles and recessions.

In short, there are many companies with a durable competitive advantage that have current ratios less than one. Such companies create an anomaly that renders the current ratio almost useless in helping us identify whether or not a company has a durable competitive advantage.

CHAPTER 29

Property, Plant, and Equipment: For Warren Not Having Them Can Be a Good Thing

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
→ Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
Other Assets	0
Total Assets	$43,059

A company's property, its manufacturing plant and equipment, and their collective value are carried on the balance

sheet as an asset. They are carried at their original cost, less accumulated depreciation. Depreciation is what occurs as the plant and equipment wear out little by little; every year, a charge is taken against the plant and equipment.

Companies that don't have a long-term competitive advantage are faced with constant competition, which means they constantly have to update their manufacturing facilities to try to stay competitive, often before such equipment is worn out. This, of course, creates an ongoing expense that is often quite substantial, and keeps adding to the amount of plant and equipment the company lists on its balance sheet.

A company that has a durable competitive advantage doesn't need to constantly upgrade its plant and equipment to stay competitive. Take the brand name gum manufacturer Wrigley. It builds a plant that makes chewing gum, and it doesn't have to update the plant and equipment until they wear out.

So the company that has a durable competitive advantage replaces its plant and equipment as they wear out, while the company that doesn't have a durable competitive advantage has to replace its plant and equipment to keep pace with the competition.

A company with a durable competitive advantage will be able to finance any new plants and equipment internally. But a company that doesn't have a competitive advantage will be forced to turn to debt to finance its constant need to retool its plants to keep up with the competition.

We see this when we take a company with a long-term competitive advantage like Wrigley, which has plant and equipment worth $1.4 billion, carries $1 billion in debt, and earns in the neighborhood of $500 million per year. Compare Wrigley with a company without a durable competitive advantage, like GM, which has plant and equipment valued at $56 billion, carries $40 billion in debt, and has lost money for the last two years.

Chewing gum is not a product that changes much, and Wrigley's brand name ensures a competitive advantage over its rivals. But GM must compete head-on with every car manufacturer on the planet, and its product mix constantly has to be upgraded and redesigned to stay ahead of the competition. This means that GM's plants have to regularly be retooled to produce the new products.

Making chewing gum is a much better and a far more profitable business for shareholders than making cars. Consider this: $100,000 invested in Wrigley back in 1990 would be worth approximately $547,000 in 2008. But $100,000 invested in GM back in 1990 would be worth approximately $97,000 in 2008. This equates to a difference of $460,000 in Wrigley's shareholders' favor. They have happily chewed their way to riches, while GM's shareholders have watched their fortunes drive off a cliff.

As Warren says, producing a consistent product that doesn't have to change equates to consistent profits. The con-

sistent product means there is no need to spend tons of money upgrading the plant and equipment just to stay competitive, which frees up tons of money for other money-making ventures. To get rich, we first have to make money, and it helps if we make lots of money. One of the ways to make lots of money is not having to spend a ton of money keeping up with the Joneses.

CHAPTER 30

GOODWILL

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
Property/Plant/Equipment	8,493
→ Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
Total Assets	$43,059

When Exxon buys XYZ oil company and Exxon pays a price in excess of XYZ's book value, the excess is recorded on Exxon's balance sheet under the heading of Goodwill. Buy a lot of companies for a price in excess of their book

value, and we end up with a lot of goodwill on our balance sheet.

Goodwill used to be written off against the earnings of the business through a process of amortization, which caused a yearly charge against earnings on the income statement under the title of amortization of goodwill. In the modern age, the FASB (Financial Accounting Standards Board) decided that goodwill wouldn't have to be amortized unless the company that the goodwill was attached to was actually depreciating in value.

Whenever we see an increase in goodwill of a company over a number of years, we can assume that it is because the company is out buying other businesses. This can be a good thing if the company is buying businesses that also have a durable competitive advantage. If the goodwill account stays the same year after year, that is because either the company is paying under book value for a business or the company isn't making any acquisitions.

Businesses that benefit from some kind of durable competitive advantage almost never sell for below their book value. We say almost never, but occasionally it does happen, and when it does, it can be the buying opportunity of a lifetime.

CHAPTER 31

Intangible Assets: Measuring the Unmeasurable

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
→ Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
Total Assets	$43,059

Intangible assets are assets we can't physically touch; these include patents, copyrights, trademarks, franchises, brand names, and the like. A long time ago, a company could slap on

to its intangibles any old valuation it thought it could get away with. Which made for some very interesting valuations and many abuses. In the current era, companies are not allowed to carry internally developed intangible assets on their balance sheets. That's put an end to watering the balance sheet with fantasy valuations for intangible assets.

However, intangible assets that are acquired from a third party are carried on the balance sheet at their fair value. If an asset has a finite life—as a patent does—it is amortized over the course of its useful life with a yearly charge made to the income statement and the balance sheet.

An odd thing occurs with companies that benefit from a durable competitive advantage. Take the Coca-Cola Company for an example. Coke's brand name is worth in excess of $100 billion, yet because it is an internally developed brand name, its real value as an intangible asset is not reflected on Coca-Cola's balance sheet. The same thing applies to Wrigley, Pepsi Co., McDonald's, and even Wal-Mart. Each of these companies benefits from having durable competitive advantage tied directly to its name; yet the value of their greatest asset, their name, isn't recognized on their balance sheets.

This is one of the reasons that the durable competitive advantage's power to increase shareholders' wealth has remained hidden from investors for so long. Short of comparing ten years' worth of income statements, investors have had no way of knowing it was there, or knowing of its potential

for making them superrich. This is how Warren was able to take large positions in such visible companies, like Coca-Cola, with the whole world watching. Yet the whole world had no clue why he was doing it. Coke was too pricey to make any sense to the value investors that followed Graham, and its price wasn't volatile enough to be interesting to Wall Street traders. What Warren could see, that no one else could, was Coke's durable competitive advantage and the long-term earning power that came with it. Earning power that, over time, would help make him the richest man in the world.

CHAPTER 32

Long-Term Investments: One of the Secrets to Warren's Success

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
→ Long-Term Investments	7,777
Other Long-Term Assets	2,675
Total Assets	$43,059

This is an asset account on a company's balance sheet, where the value of long-term investments (longer than a year),

such as stocks, bonds, and real estate is recorded. This account includes investments in the company's affiliates and subsidiaries. What is interesting about the long-term investment account is that this asset class is carried on the books at their cost or market price, whichever is lower. But it cannot be marked to a price above cost even if the investments have appreciated in value. This means that a company can have a very valuable asset that it is carrying on its books at a valuation considerably below its market price.

A company's long-term investments can tell us a lot about the investment mind-set of top management. Do they invest in other businesses that have durable competitive advantages, or do they invest in businesses that are in highly competitive markets? Sometimes we see the management of a wonderful business making huge investments in mediocre businesses for no other reason than they think big is better. Sometimes we see some enlightened manager of a mediocre business making investments in companies that have a durable competitive advantage. This is how Warren built his holding company Berkshire Hathaway into the empire that it is today. Berkshire was once-upon-a-time a mediocre business in the highly competitive textile industry. Warren bought a controlling interest, stopped paying the dividend so cash would accumulate, and then took the company's working capital and went and bought an insurance company. Then he took the assets of the

insurance company and went on a forty-year shopping spree for companies with a durable competitive advantage.

Kiss even a frog of a business enough times with a durable competitive advantage and it will turn into a prince of a business.

Or, as in Warren's case, $60 billion, which is what his stock in Berkshire is now worth.

CHAPTER 33

Other Long-Term Assets

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
→ Other Long-Term Assets	2,675
Total Assets	$43,059

Think of "other long-term assets" as a giant pool of long-term assets—assets that have useful lives of greater than a year—that didn't make it into the categories of Property and Equipment, Goodwill, Intangibles, and Long-Term Invest-

ments. An example of Other Long-Term Assets would be prepaid expenses and tax recoveries that are due to be received in the coming years.

There is little that Other Long-Term Assets can tell us about whether or not the company in question has a durable competitive advantage. So let's move on.

CHAPTER 34

Total Assets and the Return on Total Assets

Balance Sheet/Assets	
($ in millions)	
Total Current Assets	$12,005
Property/Plant/Equipment	8,493
Goodwill, Net	4,246
Intangibles, Net	7,863
Long-Term Investments	7,777
Other Long-Term Assets	2,675
→ Total Assets	$43,059

Add current assets to long-term assets, and we get the company's total assets. Its total assets will match its total liabilities, plus shareholders' equity. They balance with each other, which is why it is called a balance sheet.

Total assets are important in determining just how efficient the company is in putting its assets to use. To measure the company's efficiency, analysts have come up with the return on asset ratio, which is found by dividing net earnings by total assets.

Capital, however, always presents a barrier to entry into any industry, and one of the things that helps make a company's competitive advantage durable is the cost of the assets one needs to get into the game. Coca-Cola has $43 billion in assets and a return on assets of 12%; Procter & Gamble has $143 billion in assets and a return on assets of 7%; and Altria Group, Inc., has $52 billion in assets and a return on assets of 24%. But a company like Moody's, which has $1.7 billion in assets, shows a 43% return on assets.

While many analysts argue that the higher the return on assets the better, Warren has discovered that really high returns on assets may indicate vulnerability in the durability of the company's competitive advantage. Raising $43 billion to take on Coca-Cola is an impossible task—it's not going to happen. But raising $1.7 billion to take on Moody's is within the realm of possibility. While Moody's underlying economics is far superior to Coca-Cola's, the durability of Moody's competitive advantage is far weaker because of the lower cost of entry into its business.

The lesson here is that sometimes more can actually mean less over the long-term.

CHAPTER 35

Current Liabilities

Balance Sheet/Liabilities	
($ in millions)	
Accounts Payable	$1,380
Accrued Expenses	5,535
Short-Term Debt	5,919
Long-Term Debt Due	133
Other Current Liabilities	258
Total Current Liabilities	$13,225

Current liabilities are the debts and obligations that the company owes that are coming due within the fiscal year. They are found on the balance sheet under the headings of Accounts Payable, Accrued Expenses, Short-Term Debt, Long-Term Debt Coming Due, and Other Current Liabilities. Let's take a look at them and see what they can tell us about whether or not a company has a durable competitive advantage over its competitors.

CHAPTER 36

Accounts Payable, Accrued Expenses, and Other Current Liabilities

Balance Sheet/Liabilities	
($ in millions)	
→ Accounts Payable	$1,380
→ Accrued Expenses	5,535
Short-Term Debt	5,919
Long-Term Debt Due	133
→ Other Current Liabilities	258
Total Current Liabilities	$13,225

Accounts payable is money owed to suppliers that have provided goods and services to the company on credit. We order 1,000 pounds of coffee, and they send it to us along with a bill/invoice. The bill/invoice for the 1,000 pounds of coffee is an account payable.

Accrued expenses are liabilities that the company has

incurred, but has yet to be invoiced for. These expenses include sales tax payable, wages payable, and accrued rent payable. We hire someone and tell him that we will pay him at the end of the month; each day that he works 'til the end of the month is booked as an accrued expense.

Other debts is a slush fund for all short-term debts that didn't qualify to be included in any of the above categories.

Accounts Payable, Accrued Expenses, and Other Debts can tell us a lot about the current situation of a business, but as stand-alone entries they tell us little about the long-term economic nature of the business and whether or not it has a durable competitive advantage. However, the amount of short- and long-term debt that a company carries can tell a great deal about the long-term economics of a business and whether or not it has a durable competitive advantage.

CHAPTER 37

Short-Term Debt: How It Can Kill a Financial Institution

Balance Sheet/Liabilities	
($ in millions)	
Accounts Payable	$1,380
Accrued Expenses	5,535
→ Short-Term Debt	5,919
Long-Term Debt Due	133
Other Current Liabilities	258
Total Current Liabilities	$13,225

Short-term debt is money that is owed by the corporation and due within the year. This includes commercial paper and short-term bank loans. Short-term money historically has been cheaper than long-term money. This means that it is possible

to make money borrowing short-term and lending it long-term. We borrow short-term money at 5% and lend it long-term for 7%—sounds easy enough. But the problem with this strategy is that the money we borrowed is short-term money. That means that we have to pay it back within the year, which is easy enough to do—we just borrow more money short-term to pay back the short-term debt that is coming due. In the financial world, this is called "rolling over the debt." And it all works well until short-term rates jump above what we lent the money long at, which was 7%. Sure, it seemed like a great idea when short-term rates were 5%, but now that they have jumped to 8%, we have to refinance our short-term debt at a rate in excess of what we loaned it out at. And that does not make us happy.

Another part of the short-term borrowing disaster equation is what happens if we lend all this money long-term, but our creditors decide not to loan us any more money short-term. Suddenly we have to pay back all that money we borrowed short-term and lent long-term. But we don't have it, because we lent it long-term, which means that we won't get paid back for many, many years.

This is what happened to Bear Stearns: They borrowed short-term and bought mortgage-backed securities, using the mortgage-backed securities as collateral for the short-term loans. But one day their creditors woke up and said, "We don't think the collateral is worth what you guys told us it was

worth, so we don't want to lend you any more money and we want to collect the money we did loan you." Not a good position for Bear Stearns to be in.

The smartest and safest way to make money in banking is to borrow it long-term and lend it long-term. That's why banks are always trying to lock us into those five- and ten-year CDs. It is not the fast and easy money of borrowing short-term and lending it long, but it is a saner and far more conservative way to make money. Which is what we want in a bank and a banker—sanity.

When it comes to investing in financial institutions Warren has always shied away from companies that are bigger borrowers of short-term money than of long-term money. Warren's favorite, Wells Fargo, has 57 cents of short-term debt for every dollar of long-term debt. But an aggressive bank, like Bank of America N.A., has $2.09 of short-term debt for every dollar of long-term debt. And while being aggressive can mean making lots of money over the short-term, it has often led to financial disasters over the long-term. And one never gets rich being on the downside of a financial disaster.

In troubled financial times it is the stable conservative banks like Wells Fargo that have the competitive advantage over the go-go aggressive banks that have gotten themselves into trouble. The "durability" equates with the stability that comes with being conservative. It has money when the others have losses, which creates opportunity. Aggressive borrowers

of short-term money are often at the mercy of sudden shifts in the credit markets, which puts their entire operation at risk and equates with a loss of any kind of durability in their business model. And in the business world durability of a competitive advantage is a lot like virginity—easier to protect than it is to get back.

CHAPTER 38

Long-Term Debt Coming Due and the Troubles It Can Cause

Balance Sheet/Liabilities	
($ in millions)	
Accounts Payable	$1,380
Accrued Expenses	5,535
Short-Term Debt	5,919
→ Long-Term Debt Due	133
Other Current Liabilities	258
Total Current Liabilities	$13,225

This chapter concerns long-term debt that is coming due and has to be paid off in the current year. Long-term debt is not a yearly current liability for most businesses. However, a few very large corporations do have some portion of their long-term debt coming due on a yearly basis. Where it can cre-

ate problems is when some companies lump it in with short-term debt on the balance sheet, which creates the illusion that the company has more short-term debt than it really does.

As a rule, companies with a durable competitive advantage require little or no long-term debt to maintain their business operations, and therefore have little or no long-term debt ever coming due. So if we are dealing with a company that has a lot of long-term debt coming due, we probably aren't dealing with a company that has a long-term competitive advantage.

Any time we are buying into a company that has a durable competitive advantage but has been going through troubled times due to a one-time solvable event—like a subsidiary in a different business bleeding cash—it is best to check the horizon and see how much of the company's long-term debt is due in the years ahead. Too much debt coming due in a single year can spook investors, which will give us a lower price to buy in at.

With a mediocre company that is experiencing serious problems, too much debt coming due in a current year can lead to cash flow problems and certain bankruptcy, which is also certain death to our investment.

And having dying investments is not how we get rich.

CHAPTER 39

Total Current Liabilities and the Current Ratio

Balance Sheet/Liabilities	
($ in millions)	
Accounts Payable	$1,380
Accrued Expenses	5,535
Short-Term Debt	5,919
Long-Term Debt Due	133
Other Current Liabilities	258
→ Total Current Liabilities	$13,225

By dividing Total Current Assets by Total Current Liabilities, one can determine the liquidity of the company—the higher the current ratio, the more liquid the company is, and the greater its ability to pay current liabilities when they come due. A current ratio of over one is considered good, and anything below one, bad. If it is below one, it is thought that the

company might have a hard time meeting its short-term obligations to its creditors. But, as we discussed in Chapter 28, companies with a durable competitive advantage often have current ratios under one. What causes this anomaly is the immense earning power the durable competitive advantage creates. In short, you have a current economic picture that doesn't require the "liquidity cushion" that a company with poorer economics needs. (For a more in-depth discussion, please refer back to Chapter 28.) While the current ratio is of great importance in determining the liquidity of a marginal-to-average business, it is of little use in telling us whether or not a company has a durable competitive advantage.

company might have a hard time meeting its short-term obligations to its creditors. But, as we discussed in Chapter 28, companies with a durable competitive advantage often have current ratios under one. What causes this anomaly is the immense earning power the durable competitive advantage creates. In short, you have a current economic picture that doesn't require the "liquidity cushion" that a company with poorer economics needs. (For a more in-depth discussion, please refer back to Chapter 28.) While the current ratio is of great importance in determining the liquidity of a marginal-to-average business, it is of little use in telling us whether or not a company has a durable competitive advantage.

CHAPTER 40

Long-Term Debt: Something That Great Companies Don't Have a Lot Of

Balance Sheet/Liabilities	
($ in millions)	
Total Current Liabilities	$13,225
→ Long-Term Debt	3,277
Deferred Income Tax	1,890
Minority Interest	0
Other Liabilities	3,133
Total Liabilities	$21,525

Long-term debt means debt that matures any time out past a year. On the balance sheet it comes under the heading of long-term liabilities. If the debt comes due within the year, it is short-term debt and is placed with the company's current

liabilities. In Warren's search for the excellent business with a long-term competitive advantage, the amount of long-term debt a company carries on its books tells him a lot about the economic nature of the business.

Warren has learned that companies that have a durable competitive advantage often carry little or no long-term debt on their balance sheets. This is because these companies are so profitable that they are self-financing when they need to expand the business or make acquisitions, so there is never a need to borrow large sums of money.

One of the ways to help us identify the exceptional business, then, is to check how much long-term debt it is carrying on its balance sheet. We are not just interested in the current year; we want to look at the long-term debt load that the company has been carrying for the last ten years. If there have been ten years of operations with little or no long-term debt on the company's balance sheet it is a good bet that the company has some kind of strong competitive advantage working in its favor.

Warren's historic purchases indicate that on any given year the company should have sufficient yearly net earnings to pay off all of its long-term debt within a three- or four-year earnings period. Long-term competitive advantage holders Coca-Cola and Moody's could pay off all their long-term debt in a single year; and Wrigley and The Washington Post companies can do it in two.

But companies like GM or Ford, both in the highly com-

petitive auto industry, could spend every dime of net profit they have earned in the last ten years and still not pay off the massive amount of long-term debt they carry on their balance sheets.

The bottom line here is that companies that have enough earning power to pay off their long-term debt in under three or four years are good candidates in our search for the excellent business with a long-term competitive advantage.

But please note: Because these companies are so profitable and carrying little or no debt, they are often the targets of leveraged buyouts. This is where the buyer borrows huge amounts of money against the cash flow of the company to finance the purchase. After the leveraged buyout the business is then saddled with large amounts of debt. This was the case with the RJR/Nabisco buyout in the late 1980s.

If all else indicates that the business in question is a company with a durable competitive advantage, but it has a ton of debt on its balance sheet, a leveraged buyout may have created the debt. In cases like these the company's bonds are often the better bet, in that the company's earning power will be focused on paying off the debt and not growing the company.

The rule here is simple: Little or No Long-Term Debt Often Means a Good Long-Term Bet.

CHAPTER 41

Deferred Income Tax, Minority Interest, and Other Liabilities

Balance Sheet/Liabilities	
($ in millions)	
Total Current Liabilities	$13, 225
Long-Term Debt	3,277
→ Deferred Income Tax	1,890
→ Minority Interest	0
→ Other Liabilities	3,133
Total Liabilities	$21,525

Deferred Income Tax is tax that is due but hasn't been paid. This figure tells us little about whether or not the company has a durable competitive advantage.

The Minority Interest entry on a balance sheet is far more interesting. When the company acquires the stock of another,

it books the price it paid for the stock as an asset under "long-term investments." But when it acquires more than 80% of the stock of a company, it can shift the acquired company's entire balance sheet onto its balance sheet. The same with the income statement. An example: Berkshire's acquisition of 90% of the Nebraska Furniture Mart. Because it acquired more than 80% of the NFM, Berkshire could book 100% of NFM's income onto Berkshire's income statement, and it could add 100% of NFM's assets and liabilities to its balance sheet. What the Minority Interest entry represents is the value of the 10% of NFM that Berkshire does not own. This shows up as a liability to balance the equation, since Berkshire booked 100% of NFM's assets and liabilities, even though it owns only 90% of NFM. So what does this have to do with identifying a company with a durable competitive advantage? Not much, but it is interesting to know what matters and what doesn't in our search for the company with a durable competitive advantage.

"Other Liabilities" is a catchall category into which businesses pool their miscellaneous debt. It includes such liabilities as judgments against the company, non-current benefits, interest on tax liabilities, unpaid fines, and derivative instruments. None of these helps us in our search for the durable competitive advantage.

CHAPTER 42

Total Liabilities and the Debt to Shareholders' Equity Ratio

Balance Sheet/ Debt to Shareholders' Equity Ratio	
($ in millions)	
Total Current Liabilities	$13, 225
Long-Term Debt	3,277
Deferred Income Tax	1,890
Minority Interest	0
Other Liabilities	3,133
→ Total Liabilities	$21,525

Total liabilities is the sum of all the liabilities of the company. It is an important number that can be used to give us the debt to shareholders' equity ratio, which, with slight modification, can be used to help us identify whether or not a business has a durable competitive advantage.

The debt to shareholders' equity ratio has historically been used to help us identify whether or not a company is using debt to finance its operations or equity (which includes retained earnings). The company with a durable competitive advantage will be using its earning power to finance its operations and therefore, in theory, should show a higher level of shareholders' equity and a lower level of total liabilities. The company without a competitive advantage will be using debt to finance its operations and, therefore, should show just the opposite, a lower level of shareholders' equity and a higher level of total liabilities.

The equation is: Debt to Shareholders' Equity Ratio = Total Liabilities ÷ Shareholders' Equity.

The problem with using the debt to equity ratio as an identifier is that the economics of companies with a durable competitive advantage are so great that they don't need a large amount of equity/retained earnings on their balance sheets to get the job done; in some cases they don't need any. Because of their great earning power they will often spend their built-up equity/retained earnings on buying back their stock, which decreases their equity/retained earnings base. That in turn increases their debt to equity ratio, often to the point that their debt to equity ratio looks like that of a mediocre business—one without a durable competitive advantage.

Moody's, a Warren favorite, is an excellent example of this phenomenon. It has such great economics working in its favor

that it doesn't need to maintain any shareholders' equity. It actually spent all of its shareholders' equity on buying back its shares. It literally has negative shareholders' equity. This means that its debt to shareholders' equity ratio looks more like that of GM—a company without a durable competitive advantage and a negative net worth—than, say, that of Coca-Cola, a company with a durable competitive advantage.

However, if we add back into Moody's shareholders' equity the value of all the treasury stock that Moody has acquired through stock buybacks, then Moody's debt to equity ratio drops down to .63, in line with Coke's treasury share-adjusted ratio of .51. GM still has a negative net worth, even with the addition of the value of its treasury shares, which are nonexistent because GM doesn't have the money to buy back its shares.

It is easy to see the contrast between companies with a durable competitive advantage and those without it when we look at the treasury share-adjusted debt to shareholders' equity ratio. Durable competitive advantage holder Procter & Gamble has an adjusted ratio of .71; Wrigley, meanwhile, has a ratio of .68—which means that for every dollar of shareholders' equity Wrigley has, it also has 68 cents in debt. Contrast P&G and Wrigley with Goodyear Tire, which has an adjusted ratio of 4.35, or Ford, which has an adjusted ratio of 38.0. This means that for every dollar of shareholders' equity that Ford has, it also has $38 in debt—which

equates to $7.2 billion in shareholders' equity and $275 billion in debt.

With financial institutions like banks, the ratios, on average, tend to be much higher than those of their manufacturing cousins. Banks borrow tremendous amounts of money and then loan it all back out, making money on the spread between what they paid for the money and what they can loan it out for. This leads to an enormous amount of liabilities, which are offset by a tremendous amount of assets. On average, the big American money center banks have $10 in liabilities for every dollar of shareholders' equity they keep on their books. This is what Warren means when he says that banks are highly leveraged operations. There are exceptions though and one of them is M&T Bank, a longtime Warren favorite. M&T has a ratio of 7.7, which is reflective of its management's more conservative lending practices.

The simple rule here is that, unless we are looking at a financial institution, any time we see an adjusted debt to shareholders' equity ratio below .80 (the lower the better), there is a good chance that the company in question has the coveted durable competitive advantage we are looking for.

And finding what one is looking for is always a good thing, especially if one is looking to get rich.

CHAPTER 43

Shareholders' Equity/Book Value

Balance Sheet/Shareholders' Equity	
($ in millions)	
Total Liabilities	$21,525
Preferred Stock	0
Common Stock	880
Additional Paid in Capital	7,378
Retained Earnings	36,235
Treasury Stock—Common	−23,375
Other Equity	626
→ Total Shareholders' Equity	21,744
Total Liabilities & Shareholders' Equity	$43,269

When you subtract all your liabilities from all your assets you get your net worth. If you take a company's total assets

and subtract its total liabilities you get the net worth of the company, which is also known as the shareholders' equity or book value of the business. This is the amount of money that the company's owners/shareholders have initially put in and have left in the business to keep it running. Shareholders' Equity is accounted for under the headings of Capital Stock, which includes Preferred and Common Stock; Paid in Capital, and Retained Earnings. Add together Total Liabilities and Total Shareholders' Equity and you get a sum that should equal Total Assets, which is why it is called a balance sheet—both sides balance.

Why Shareholders' Equity is an important number to us is that it allows us to calculate the return on shareholders' equity, which is one of the ways we determine whether or not the company in question has a long-term competitive advantage working in its favor.

Let's check it out.

CHAPTER 44

Preferred and Common Stock: Additional Paid in Capital

Shareholders' Equity	
($ in millions)	
→ Preferred Stock	$0
→ Common Stock	880
→ Additional Paid in Capital	7,378
Retained Earnings	36,235
Treasury Stock—Common	−23,375
Other Equity	626
Total Shareholders' Equity	$21,744

A company can raise new capital by selling bonds or stock (equity) to the public. The money raised by selling bonds has to be paid back at some point in the future. It is borrowed

money. But when the company raises money selling preferred or common stock (which is called "equity") to the public, it never has to be paid back. This money is the company's forever, to do with as it pleases.

Common stock represents ownership in the company. Common stock owners are the owners of the company and have the right to elect a board of directors, which, in turn, will hire a CEO to run the company. Common stockholders receive dividends if the board of directors votes to pay them. And if the entire company is sold, it is the common stockholders who get all the loot.

There is a second class of equity, called preferred stock. Preferred shareholders don't have voting rights, but they do have a right to a fixed or adjustable dividend that must be paid before the common stock owners receive a dividend. Preferred shareholders also have priority over common shareholders in the event that the company falls into bankruptcy.

From a balance sheet perspective preferred and common stocks are carried on the books at their par value, and any money in excess of par that was paid in when the company sold the stock will be carried on the books as "paid in capital." So if the company's preferred stock has a par value of $100/share, and it sold it to the public at $120 a share, a $100-a-share will be carried on the books under preferred stock, and $20 a share will be carried under paid in capital.

The same thing applies to common stock, with, say, a par

value of $1 a share. If it is sold to the public at $10 a share, it will be booked on the balance sheet as $1 a share under common stock and $9 a share under paid in capital.

The odd thing about preferred stock is that companies that have a durable competitive advantage tend not to have any. This is in part because they tend not to have any debt. They make so much money that they are self-financing. And while preferred stock is technically equity, in that the original money received by the company never has to be paid back, it functions like debt in that dividends have to be paid out. But unlike the interest paid on debt, which is deductible from pretax income, the dividends paid on preferred stock are not deductible, which tends to make issuing preferred shares very expensive money. Because it is expensive money, companies like to stay away from it if they can. So one of the markers we look for in our search for a company with a durable competitive advantage is the absence of preferred stock in its capital structure.

CHAPTER 45

Retained Earnings: Warren's Secret for Getting Superrich

Balance Sheet/Shareholders' Equity	
($ in millions)	
Preferred Stock	$0
Common Stock	880
Additional Paid in Capital	7,378
→ Retained Earnings	36,235
Treasury Stock—Common	−23,375
Other Equity	626
Total Shareholders' Equity	$21,744

At the end of the day, a company's net earnings can either be paid out as dividends or used to buy back the company's shares, or they can be retained to keep the business growing. When they are retained in the business, they are added to an

account on the balance sheet, under shareholders' equity, called retained earnings.

If the earnings are retained and profitably put to use, they can greatly improve the long-term economic picture of the business. It was Warren's policy of retaining 100% of Berkshire's net earnings that helped drive its shareholders' equity from $19 a share in 1965 to $78,000 a share in 2007.

To find the yearly net earnings that are going to be added to the company's retained earnings pool, we take the company's after-tax net earnings and deduct the amount that the company paid out in dividends and the expenditures in buying back stock that it had during the year. In 2007 Coca-Cola had after-tax net earnings of $5.9 billion and paid out in dividends and stock buybacks $3.1 billion. This gave the company approximately $2.8 billion in earnings, which were added to the retained earnings pool.

Retained Earnings is an accumulated number, which means that each year's new retained earnings are added to the total of accumulated retained earnings from all prior years. Likewise, if the company loses money, the loss is subtracted from what the company has accumulated in the past. If the company loses more money than it has accumulated, the retained earnings number will show up as negative.

Out of all the numbers on a balance sheet that can help us determine whether the company has a durable competitive advantage, this is one of the most important. It is important

in that if a company is not making additions to its retained earnings, it is not growing its net worth. If it not growing its net worth, it is unlikely to make any of us superrich over the long run.

Simply put, the rate of growth of a company's retained earnings is a good indicator whether or not it is benefiting from having a durable competitive advantage. Let's check out a few of Warren's favorite companies with a durable competitive advantage: Coca-Cola has been growing its retained earnings pool for the last five years at an annual rate of 7.9%, Wrigley at a very chewy 10.9%, Burlington Northern Santa Fe Railway at a smoking 15.6%, Anheuser-Busch at a foamy 6.4%, Wells Fargo at a very bankable 14.2%, and Warren's very own Berkshire Hathaway at an outstanding 23%.

Not all growth in retained earnings is due to an incremental increase in sales of existing products; some of it is due to the acquisitions of other businesses. When two companies merge, their retained earnings pools are joined, which creates an even larger pool. As an example, Procter & Gamble, in 2005, saw its retained earnings jump from $13 billion to $31 billion when it merged with The Gillette Co.

Even more interesting is the fact that both General Motors and Microsoft show negative retained earnings. General Motors shows a negative number because of the poor economics of the auto business, which causes the company to lose billions. Microsoft shows a negative number because it decided

that its economic engine is so powerful that it doesn't need to retain the massive amount of capital it has collected over the years and has instead chosen to spend its accumulated retained earnings and more on stock buybacks and dividend payments to its shareholders.

One of the great secrets of Warren's success with Berkshire Hathaway is that he stopped its dividend payments the day that he took control of the company. This allowed 100% of the company's yearly net earnings to be added into the retained earnings pool. As opportunities showed up, he invested the company's retained earnings in businesses that earned even more money, and that money was all added back into the retained earnings pool and eventually invested in even more money-making operations. As time went on, Berkshire's growing pool of retained earnings increased its ability to make more and more money. From 1965 to 2007, Berkshire's expanding pool of retained earnings helped grow its pretax earnings from $4 a share in 1965 to $13,023 a share in 2007, which equates to an average annual growth rate of approximately 21%.

The theory is simple: the more earnings that a company retains, the faster it grows its retained earnings pool, which, in turn will increase the growth rate for future earnings. The catch is, of course, that it has to keep buying companies that have a durable competitive advantage. Which is exactly what Warren has done with Berkshire Hathaway. Berkshire is like a goose that not only keeps laying golden eggs, but each one of

those golden eggs hatches another goose with the golden touch, and those golden geese lay even more golden eggs. Warren has discovered that if you keep this process going on long enough, eventually you get to start counting your net worth in terms of billions, instead of just millions.

CHAPTER 46

Treasury Stock:* Warren Likes to See This on the Balance Sheet

Balance Sheet/Shareholders' Equity	
($ in millions)	
Preferred Stock	$0
Common Stock	880
Additional Paid in Capital	7,378
Retained Earnings	36,235
→ Treasury Stock—Common	−23,375
Other Equity	626
Total Shareholders' Equity	$21,744

*What is known as treasury stock in the United States is referred to as treasury shares in the United Kingdom.

When a company buys back its own shares, it can do two things with them. It can cancel them or it can retain them with the possibility of reissuing them later on. If it cancels them the shares cease to exist. But if it keeps them, with the possibility of reissuing them later on, they are carried on the balance sheet under shareholders' equity as treasury stock. Shares held as treasury stock have no voting rights, nor do they receive dividends and, though arguably an asset, they are carried on the balance sheet at a negative value because they represent a reduction in the shareholders' equity.

Companies with a durable competitive advantage, because of their great economics, tend to have lots of free cash that they can spend on buying back their shares. Thus one of the hallmarks of a company with a durable competitive advantage is the presence of treasury shares on the balance sheet.

There are a several other financial dynamics to be aware of regarding treasury shares. One is that when a company buys its own shares, and holds them as treasury stock, it is effectively decreasing the company's equity, which increases the company's return on shareholders' equity. Since a high return on shareholders' equity is one sign of a durable competitive advantage, it is good to know if the high returns on equity are being generated by financial engineering or exceptional business economics or because of a combination of the two.

To see which is which, convert the negative value of the treasury shares into a positive number and add it to the shareholders' equity instead of subtracting it. Then divide the company's net earnings by the new total shareholders' equity. This will give us the company's return on equity minus the effects of financial engineering.

Also, in the United States, in determining whether or not the personal holding company tax applies, treasury shares are not part of the pool of the outstanding shares, when it comes to determining control of the company. Unscrupulous types will represent to the IRS that they only own 49% of all outstanding shares. But if they subtract the treasury shares, as the law says they should, they really control in excess of 50%, which gives them control of the business and potentially makes them liable to the personal holding company tax.

Let us leave this chapter with a simple rule: The presence of treasury shares on the balance sheet, and a history of buying back shares, are good indicators that the company in question has a durable competitive advantage working in its favor.

CHAPTER 47

Return on Shareholders' Equity: Part One

Balance Sheet/Shareholders' Equity	
($ in millions)	
Preferred Stock	$0
Common Stock	880
Additional Paid in Capital	7,378
Retained Earnings	36,235
Treasury Stock—Common	−23,375
Other Equity	626
Total Shareholders' Equity	$21,744

Shareholders' equity is equal to the company's total assets minus its total liabilities. That happens to equal the total sums of preferred and common stock, plus paid in capital, plus retained earnings, less treasury stock.

Shareholders' equity has three sources. One is the capital that was originally raised selling preferred and common stock to the public. The second is any later sales of preferred and common stock to the public after the company is up and running. The third, and most important to us, is the accumulation of retained earnings.

Since all equity belongs to the company, and since the company belongs to the common shareholders, the equity really belongs to the common shareholders, which is why it is called shareholders' equity.

Now if we are shareholders in a company, we would be very interested in how good a job management does at allocating our money, so we can earn even more. If they are bad at it we won't be very happy and might even sell our shares and put our money elsewhere. But if they are really good at it we might even buy more of the company, along with everyone else who is impressed with management's ability to profitably put shareholders' equity to good use. To this end, financial analysts developed the return on shareholders' equity equation to test management's efficiency in allocating the shareholders' money. This is an equation that Warren puts great stock in, in his search for the company with a durable competitive advantage, and it is the topic of our next chapter.

CHAPTER 48

Return on Shareholders' Equity: Part Two

Calculation: Net Earnings divided by Shareholders' Equity equals Return on Shareholders' Equity.

What Warren discovered is that companies that benefit from a durable or long-term competitive advantage show higher-than-average returns on shareholders' equity. Warren's favorite, Coca-Cola, shows a return on shareholders' equity of 30%; Wrigley comes in at 24%; Hershey's earns a delicious 33%; and Pepsi measures in at 34%.

Shift over to a highly competitive business like the airlines, where no one company has a sustainable competitive advantage, and return on equity sinks dramatically. United Airlines, in a year that it makes money, comes in at 15%, and American Airlines earns 4%. Delta Air Lines and Northwest don't earn anything because they don't earn any money.

High returns on equity mean that the company is making good use of the earnings that it is retaining. As time goes by,

these high returns on equity will add up and increase the underlying value of the business, which, over time, will eventually be recognized by the stock market through an increasing price for the company's stock.

Please note: Some companies are so profitable that they don't need to retain any earnings, so they pay them all out to the shareholders. In these cases we will sometimes see a negative number for shareholders' equity. The danger here is that insolvent companies will also show a negative number for shareholders' equity. If the company shows a long history of strong net earnings, but shows a negative shareholders' equity, it is probably a company with a durable competitive advantage. If the company shows both negative shareholders' equity and a history of negative net earnings, we are probably dealing with a mediocre business that is getting beaten up by the competition.

So here is the rule: High returns on shareholders' equity means "come play." Low returns on shareholders' equity mean "stay away."

Got it? Okay, let's move on.

CHAPTER 49

The Problem with Leverage and the Tricks It Can Play on You

Leverage is the use of debt to increase the earnings of the company. The company borrows $100 million at 7% and puts that money to work, where it earns 12%. This means that it is earning 5% in excess of its capital costs. The result is that $5 million is brought to the bottom line, which increases earnings and return on equity.

The problem with leverage is that it can make the company appear to have some kind of competitive advantage, when it in fact is just using large amounts of debt. Wall Street investment banks are notorious for the use of very large amounts of leverage to generate earnings. In their case they borrow $100 billion at, let us say, 6% and then loan it out at 7%, which means that they are earning 1% on the $100 billion, which equates to $1 billion. If that $1 billion shows up year after year, it creates the appearance of some kind of durable competitive advantage, even if there isn't one.

The problem is that while it appears that the investment bank has consistency in its income stream, the actual source that is sending it the interest payments may not be able to maintain the payments. This happened in the recent subprime-lending crisis that cost the banks hundreds of billions of dollars. They borrowed billions at, say, 6% and loaned it out at 8% to subprime homebuyers, which made them a ton of money. But when the economy started to slip, the subprime homebuyers started to default on their mortgages, which meant they stopped making interest payments. These subprime borrowers did not have a durable source of income, which ultimately meant that the investment banks didn't either.

In assessing the quality and durability of a company's competitive advantage, Warren has learned to avoid businesses that use a lot of leverage to help them generate earnings. In the short run they appear to be the goose that lays the golden eggs, but at the end of the day, they are not.

THE CASH FLOW STATEMENT

"There is a huge difference between the business that grows and requires lots of capital to do so and the business that grows and doesn't require capital."

—Warren Buffett

CHAPTER 50

The Cash Flow Statement: Where Warren Goes to Find the Cash

Most companies use what is called an Accrual Method of accounting, as opposed to a Cash Method. With the Accrual Method sales are booked when the goods go out the door, even if the buyer takes years to pay for them. With a Cash Method sales are only booked when the cash comes in. Because almost all businesses extend some kind of credit to their buyers, companies have found it more advantageous to use the Accrual Method, which allows them to book the sales on credit as income under accounts receivable on the income statement.

Since the Accrual Method of accounting allows credit sales to be booked as revenue it has become necessary for companies to keep separate track of the actual cash that flows in and out of the business. To this end, accountants created the cash flow statement.

A company can have a lot of cash coming in through the sale of shares or bonds and still not be profitable. (Similarly, a company can be profitable with a lot of sales on credit and not a lot of cash coming in.) The cash flow statement will tell us only if the company is bringing in more cash than it is spending ("positive cash flow") or if it is spending more cash than it is bringing in ("negative cash flow").

Cash flow statements are like income statements in that they always cover a set period of time. Company accountants generate one every three months and for the fiscal year.

The cash flow statement breaks down into three sections:

First, there is cash flow from operating activities: This area starts with net income and then adds back in depreciation and amortization. Though these are real expenses from an accounting point of view, they don't eat up any cash, because they represent cash that was eaten up years ago. What we end up with is Total Cash from Operating Activities.

($ in millions)	
Net Income	$5,981
Depreciation	1,163
Amortization	125
Total Cash from Operating Activities	$7,269

Next is cash flow from investing operations: This area includes an entry for all capital expenditures made for that accounting period. Capital expenditures is always a negative number because it's an expenditure, which causes a depletion of cash.

Also included in this category is Total Other Investing Cash Flow Items, which adds up all the cash that gets expended and brought in from the buying and selling of income-producing assets. If more cash is expended than is brought in, it is a negative number. If more cash is brought in than is expended, it is a positive number.

Both of these entries are added together to give us Total Cash from Investing Activities.

($ in millions)	
Capital Expenditures	($1,648)
Other Investing Cash Flow Items	(5,071)
Total Cash from Investing Activities	($6,719)

Finally, there is the section on cash flow from financing activities: This measures the cash that flows in and out of a company because of financing activities. This includes all outflows of cash for the payment of dividends. It also includes the selling and buying of the company's stock. When the company

sells shares to finance a new plant, cash flows in to the company. When the company buys back its shares, cash flows out of the company. The same thing happens with bonds: Sell a bond and cash flows in; buy back a bond and cash flows out. All three of these entries are then added together to provide Total Cash from Financing Activities.

($ in millions)	
Cash Dividends Paid	($3,149)
Issuance (Retirement) of Stock, Net	(219)
Issuance (Retirement) of Debt, Net	4,341
Total Cash from Financing Activities	$973

Now if we add the Total Cash from Operating Activities, with Cash for Investing Activities, together with the Total Cash from Financing Activities, we get the company's Net Change in Cash.

($ in millions)	
Total Cash from Operating Activities	$7,269
Total Cash from Investing Activities	(6,719)
Total Cash from Financing Activities	973
Net Change in Cash	$1,523

What Warren has discovered is that some of the information found on a company's cash flow statement can be very useful in helping us determine whether or not the company in question is benefiting from having a durable competitive advantage. So let's roll up our sleeves and dive into the cash flow statement to see what Warren is seeing, as he searches for the company that will make him his next billion.

CHAPTER 51

Capital Expenditures: Not Having Them Is One of the Secrets to Getting Rich

Cash Flow Statement	
($ in millions)	
→ Capital Expenditures	($1,648)
Other Investing Cash Flow Items	(5,071)
Total Cash from Investing Activities	($6,719)

Capital expenditures are outlays of cash or the equivalent in assets that are more permanent in nature—held longer than a year—such as property, plant, and equipment. They also include expenditures for such intangibles as patents. Basically they are assets that are expensed over a period of time greater

than a year through depreciation or amortization. Capital expenditures are recorded on the cash flow statement under investment operations.

Buying a new truck for your company is a capital expenditure, the value of the truck will be expensed through depreciation over its life—let's say six years. But the gasoline used in the truck is a current expense, with the full price deducted from income during the current year.

When it comes to making capital expenditures, not all companies are created equal. Many companies must make huge capital expenditures just to stay in business. If capital expenditures remain high over a number of years, they can start to have deep impact on earnings. Warren has said that this is the reason that he never invested in telephone companies—the tremendous capital outlays in building out communication networks greatly hamper their long-term economics.

As a rule, a company with a durable competitive advantage uses a smaller portion of its earnings for capital expenditures for continuing operations than do those without a competitive advantage. Let's look at a couple of examples.

Coca-Cola, a long-time Warren favorite, over the last ten years earned a total $20.21 per share while only using $4.01 per share, or 19% of its total earnings, for capital expenditures for the same time period. Moody's, a company Warren has identified as having a durable competitive advantage, earned $14.24 a share over the last ten years while using a

minuscule $0.84 a share, or 5% of its total earnings, for capital expenditures.

Compare Coke and Moody's with GM, which over the last ten years earned a total $31.64 a share after subtracting losses, while burning through a whopping $140.42 a share in capital expenditures. Or tiremaker Goodyear, which over the last ten years earned a total of $3.67 a share after subtracting losses and had total capital expenditures of $34.88 a share.

If GM used 444% more for capital expenditures than it earned, and Goodyear used 950%, where did all that extra money come from? It came from bank loans and from selling tons of new debt to the public. Such actions add more debt to these companies' balance sheets, which increases the amount of money they spend on interest payments, which is never a good thing.

Both Coke and Moody's, however, have enough excess income to have stock buyback programs that reduce the number of shares outstanding, while at the same time either reducing long-term debt or keeping it low. Both actions are big positives to Warren, and both helped him identify Coca-Cola and Moody's as businesses with a durable competitive advantage working in their favor.

When we look at capital expenditures in relation to net earnings we simply add up a company's total capital expenditures for a ten-year period and compare the figure with the company's total net earnings for the same ten-year period. The

reason we look at a ten-year period is that it gives us a really good long-term perspective as to what is going on with the business.

Historically, durable competitive advantage companies used a far smaller percentage of their net income for capital expenditures. For instance, Wrigley annually uses approximately 49% of its net earnings for capital expenditures. Altria uses approximately 20%; Procter & Gamble, 28%; Pepsico, 36%; American Express, 23%; Coca-Cola, 19%; and Moody's, 5%.

Warren has discovered that if a company is historically using 50% or less of its annual net earnings for capital expenditures, it is a good place to look for a durable competitive advantage. If it is consistently using less than 25% of its net earnings for capital expenditures, that scenario occurs more than likely because the company has a durable competitive advantage working in its favor.

And having a durable competitive advantage working in our favor is what it is all about.

CHAPTER 52

Stock Buybacks: Warren's Tax-Free Way to Increase Shareholder Wealth

Cash Flow Statement	
Financing Cash Flow Items	
($ in millions)	
Total Cash Dividends Paid	($3,149)
→ Issuance (Retirement) of Stock, Net	(219)
Issuance (Retirement) of Debt, Net	4,341
Cash from Financing Activities	$973

In the above cash flow statement the company being examined paid out dividends of $3.149 million, bought back $219 million of its shares, and sold $4.341 million of new debt. All

of this gave the company a net addition of $973 million in cash from financing activities.

Companies that have durable competitive advantage working in their favor make a ton of money, which creates the lovely problem of having to do something with it. If they don't just want to sit on it, or they can't reinvest it in the existing business or find a new business to invest in, they can either pay it out as dividends to their shareholders or use it to buy back shares. Since shareholders have to pay income tax on the dividends, Warren has never been too fond of using dividends to increase shareholders' wealth. This doesn't make anyone happy. A neater trick that Warren loves is to use some of the excess money that the company is throwing off to buy back the company's shares. This reduces the number of outstanding shares—which increases the remaining shareholders' interest in the company—and increases the per-share earnings of the company, which eventually makes the stock price go up.

Let's look at an example: If the company earned $10 million and has one million shares outstanding, it would have earnings of $10 a share. If we increase the number of shares outstanding to two million, the per-share earnings will drop to $5 a share. Likewise, if we decrease the number of shares outstanding to 500,000, we will increase the per-share earnings to $20 a share. More shares outstanding means lower per-share earnings, and lower shares outstanding means higher per-share earnings. Thus if the company buys back its own shares

it can increase its per-share earnings figure even though actual net earnings don't increase. The best part is that there is an increase in the shareholders' wealth that they don't have to pay taxes on until they sell their stock. Think of it as the gift that keeps on giving.

Warren is such a big fan of this bit of financial engineering that he pushes the board of directors of all the excellent companies he invests in to buy back shares instead of increasing the dividend. He used it with GEICO, and he still is using it with The Washington Post Company.

To find out if a company is buying back its shares, go to the cash flow statement and look under Cash from Investing Activities. There you will find a heading titled "Issuance (Retirement) of Stock, Net." This entry nets out the selling and buying back of the company's shares. If the company is buying back its shares year after year, it is a good bet that it is a durable competitive advantage that is generating all the extra cash that allows it to do so.

In other words, one of the indicators of the presence of a durable competitive advantage is a "history" of the company repurchasing or retiring its shares.

VALUING THE COMPANY WITH A DURABLE COMPETITIVE ADVANTAGE

"I look for businesses in which I think I can predict what they're going to look like in ten to fifteen years' time. Take Wrigley's chewing gum. I don't think the Internet is going to change how people chew gum."

—Warren Buffett

CHAPTER 53

Warren's Revolutionary Idea of the Equity Bond and How It Has Made Him Superrich

In the late 1980s, Warren gave a talk at Columbia University about how companies with a durable competitive advantage show such great strength and predictability in earnings growth that growth turns their shares into a kind of equity bond, with an ever-increasing coupon or interest payment. The "bond" is the company's shares/equity, and the "coupon/interest payment" is the company's pretax earnings. Not the dividends that the company pays out, but the actual pretax earnings of the business.

This is how Warren buys an entire business: He looks at its pretax earnings and asks if the purchase is a good deal relative to the economic strength of the company's underlying economics and the price being asked for the business. He uses the same reasoning when he is buying a partial interest in a company via the stock market.

What attracts Warren to the conceptual conversion of a company's shares into equity/bonds is that the durable competitive advantage of the business creates underlying economics that are so strong they cause a continuing increase in the company's earnings. With this increase in earnings comes an eventual increase in the price of the company's shares as the stock market acknowledges the increase in the underlying value of the company.

Thus, at the risk of being repetitive, to Warren the shares of a company with a durable competitive advantage are the equivalent of equity/bonds, and the company's pretax earnings are the equivalent of a normal bond's coupon or interest payment. But instead of the bond's coupon or interest rate being fixed, it keeps increasing year after year, which naturally increases the equity/bond's value year after year.

This is what happens when Warren buys into a company with a durable competitive advantage. The per-share earnings continue to rise over time—either through increased business, expansion of operations, the purchase of new businesses, or the repurchase of shares with money that accumulates in the company's coffers. With the rise in earnings comes a corresponding increase in the return that Warren is getting on his original investment in the equity bond.

Let's look at an example to see how his theory works.

In the late 1980s, Warren started buying shares in Coca-Cola for an average price of $6.50 a share against pretax earnings of $.70 a share, which equates to after-tax earnings of

$.46 a share. Historically, Coca-Cola's earnings had been growing at an annual rate of around 15%. Seeing this, Warren could argue that he just bought a Coca-Cola equity bond that is paying an initial pretax interest rate of 10.7% on his $6.50 investment. He could also argue that that yield would increase over time at a projected annual rate of 15%.

Understand that, unlike the Graham-based value investors, Warren is not saying that Coca-Cola is worth $60 and is trading at $40 a share; therefore it is "undervalued." What he is saying is that at $6.50 a share, he was being offered a relatively risk-free initial pretax rate of return of 10.7%, which he expected to increase over the next twenty years at an annual rate of approximately 15%. Then he asked himself if that was an attractive investment given the rate of risk and return on other investments.

To the Graham-based value investors, a pretax 10.7% rate of return growing at 15% a year would not be interesting since they are only interested in the stock's market price and, regardless of what happens to the business, have no intention of holding the investment for more than a couple of years. But to Warren, who plans on owning the equity bond for twenty or more years, it is his dream investment.

Why is it his dream investment? Because with each year that passes, his return on his initial investment actually increases, and in the later years the numbers really start to pyramid. Consider this: Warren's initial investment in The Washington Post Company cost him $6.36 a share. Thirty-four

years later, in 2007, the media company is earning a pretax $54 a share, which equates to an after-tax return of $34 a share. This gives Warren's Washington Post equity bonds a current pretax yield of 849%, which equates to an after-tax yield of 534%. (And you were wondering how Warren got so rich!)

So how did Warren do with his Coca-Cola equity bonds?

By 2007 Coca-Cola's pretax earnings had grown at an annual rate of approximately 9.35% to $3.96 a share, which equates to an after-tax $2.57 a share. This means that Warren can argue that his Coke equity bonds are now paying him a pretax return of $3.96 a share on his original investment of $6.50 a share, which equates to a current pretax yield of 60% and a current after-tax yield of 40%.

The stock market, seeing this return, over time, will eventually revalue Warren's equity bonds to reflect this increase in value.

Consider this: With long-term corporate interest rates at approximately 6.5% in 2007, Warren's Washington Post equity bonds/shares, with a pretax $54 earnings/interest payment, were worth approximately $830 per equity bond/share that year ($54 ÷ .065 = $830). During 2007, Warren's Washington Post equity bonds/shares traded in a range of between $726 and $885 a share, which is right about in line with the equity bond's capitalized value of $830 a share.

We can witness the same stock market revaluing phenomenon with Warren's Coca-Cola equity bonds. In 2007 they

earned a pretax $3.96 per equity bond/share, which equates to an after-tax $2.57 per equity bond/share. Capitalized at the corporate interest rate of 6.5%, Coke's pretax earnings of $3.96 are worth approximately $60 per equity bond/share ($3.96 ÷ .065 = $60). During 2007, the stock market valued Coca-Cola between $45 and $64 a share.

One of the reasons that the stock market eventually tracks the increase in these companies' underlying values is that their earnings are so consistent, they are an open invitation to a leveraged buyout. If a company carries little debt and has a strong earnings history, and its stock price falls low enough, another company will come in and buy it, financing the purchase with the acquired company's earnings. Thus when interest rates drop, the company's earnings are worth more, because they will support more debt, which makes the company's shares worth more. And when interest rates rise, the earnings are worth less, because they will support less debt. This makes the company's stock worth less.

What Warren has learned is that if he buys a company with a durable competitive advantage, the stock market, over time, will price the company's equity bonds/shares at a level that reflects the value of its earnings relative to the yield on long-term corporate bonds. Yes, some days the stock market is pessimistic and on others is full of wild optimism, but in the end it is long-term interest rates that determine the economic reality of what long-term investments are worth.

CHAPTER 54

The Ever-Increasing Yield Created by the Durable Competitive Advantage

To belabor the point, because it is definitely worth belaboring, let's look at a couple of Warren's other favorite durable competitive advantage companies to see if the yields on their equity bonds/shares have increased over time:

In 1998 Moody's' reported after-tax earnings of $.41 per share. By 2007 Moody's after-tax earnings had grown to $2.58 a share. Warren paid $10.38 a share for his Moody's equity bonds, and today they are earning an after-tax yield of 24%, which equates to a pretax yield of 38%.

In 1998 American Express had after-tax earnings of $1.54 a share. By 2008 its after-tax earnings had increased to $3.39 a share. Warren paid $8.48 a share for his American Express equity bonds, which means they are currently yielding an after-tax 40% rate of return, which equates to a 61% pretax rate of return.

Long-time Warren favorite Procter & Gamble earned an after-tax $1.28 a share in 1998. By 2007 it had after-tax earnings of $3.31 a share. Warren paid $10.15 a share for his Procter & Gamble equity bonds, which are now yielding an after-tax 32%, which equates to a pretax return of 49%.

With See's Candy Warren bought the whole company for $25 million back in 1972. In 2007 it had pretax earnings of $82 million, which means his See's equity bonds are now producing an annual pretax yield of 328% on his original investment.

With all these companies, their durable competitive advantage caused their earnings to increase year after year, which, in turn, increased the underlying value of the business. Yes, the stock market may take its own sweet time acknowledging this increase, but it will eventually happen, and Warren has banked on that "happening" many, many times.

CHAPTER 55

More Ways to Value a Company with a Durable Competitive Advantage

As stated earlier, in 1987 Warren started buying shares in Coca-Cola for an average price of $6.50 a share against pretax earnings of $.70 a share; this equates to after-tax earnings of $.46 a share. Historically, Coca-Cola's earnings had been growing at an annual rate of around 10%.

Seeing this, Warren could argue that he had just bought a Coca-Cola equity bond paying an initial pretax interest rate of 10.7% on his $6.50 investment. He could also argue that that pretax yield would increase over time at a projected annual rate of 10% (Coca-Cola's average annual rate of earnings growth for the ten years prior to 1987).

If, in 1987, he had projected out the earnings growth of 10% forward, he could have argued that by 2007 Coca-Cola would have pretax per-share earnings of $4.35 and after-tax earnings of $2.82 a share. This would mean that by 2007 his

pretax return on his Coca-Cola equity bonds would grow to 66%, which equates to an after-tax return of 43%.

So what was a pretax 66% return on a $6.50 equity bond in 2007 worth in 1987? It depends on the discount rate that we use. If we use 7%, which is right about what long-term rates were back then, we get a discounted back value of approximately 17%. Multiply 17% by the $6.50 a share he was paying for and we would get $1.10 a share. Multiply $1.10 by Coca-Cola's 1987 P/E of 14 and we get $15.40 per share. Thus Warren could have argued in 1987 that he was buying an equity bond for $6.50 a share, and that if he held it for twenty years, its 1987 intrinsic value really would be $15.40 a share.

By 2007 Coca-Cola's pretax earnings had grown at an annual rate of 9.35% to $3.96 a share, which equates to an after-tax $2.57 a share. This means that Warren can argue that his Coca-Cola equity bonds are now paying him a pretax return of $3.96 a share on his original investment of $6.50 a share, which equates to a current pretax yield of 60% and an after-tax yield of 40%.

The stock market in 2007 valued Warren's equity bonds at between $45 and $64 a share. In 2007 Coca-Cola earned a pretax $3.96 per equity bond/share, which equated to an after-tax $2.57 per equity bond/share. Capitalized at the 2007 corporate interest rate of 6.5%, Coca-Cola's pretax earnings of $3.96 a share are worth approximately $60 per equity

bond/share ($3.96 ÷ .065 = $60). This is in line with the 2007 stock market value at between $45 and $64 a share.

With the market valuing Warren's Coca-Cola equity bonds at $64 a share in 2007, Warren could calculate that he has been earning a tax-deferred annual compounding rate of return of 12.11% on his original investment. Think of it as a bond that paid an annual rate of return of 12.11% without tax on the interest earned. Not only that: You got to reinvest all those interest payments in more bonds that were paying 12.11%. Yes, someday you will have to pay taxes when you sell your equity bonds, but if you don't sell them you just keep on earning 12.11% free of taxes year after year after year. . . .

Don't believe it? Consider this: Warren has approximately $64 billion in capital gains on his Berkshire stock and has yet to pay a penny in taxes on it. The greatest accumulation of private wealth in the history of the world and not a penny paid to the taxman.

Does it get any better?

CHAPTER 56

How Warren Determines the Right Time to Buy a Fantastic Business

In Warren's world the price you pay directly affects the return on your investment. Since he is looking at a company with a durable competitive advantage as being a kind of equity bond, the higher the price he pays, the lower his initial rate of return and the lower the rate of return on the company's earnings in ten years. Let's look at an example: In the late 1980s, Warren started buying Coca-Cola for an average price of $6.50 a share against earnings of a $.46 a share, which in Warren's world equates to an initial rate of return of 7%. By 2007 Coca-Cola was earning $2.57 a share. This means that Warren can argue that his Coca-Cola equity bond was now paying him $2.57 a share on his original investment of $6.50, which equates to a return of 39.9%. But if he had paid $21 a share for his Coca-Cola stock back in the late 1980s, his initial rate of return would have been 2.2%. By 2007 this would have grown only to

12% ($2.57 ÷ $21 = 12%), which is definitely not as attractive a number as 39.9%.

Thus the lower the price you pay for a company with a durable competitive advantage, the better you are going to do over the long-term, and Warren is all about the long-term. However, these companies seldom, if ever, sell at a bargain price from an old-school Grahamian perspective. This is why investment managers who follow the value doctrine that Graham preached never own super businesses, because to them these businesses are too expensive.

So when do you buy in to them? In bear markets for starters. Though they might still seem high priced compared with other "bear market bargains," in the long run they are actually the better deal. And occasionally even a company with a durable competitive advantage can screw up and do something stupid, which will send its stock price downward over the short-term. Think New Coke. Warren has said that a wonderful buying opportunity can present itself when a great business confronts a one-time solvable problem. The key here is that the problem is solvable.

When do you want to stay away from these super businesses? At the height of bull markets, when these super businesses trade at historically high price-to-earnings ratios. Even a company that benefits from having a durable competitive advantage can't unmoor itself from producing mediocre results for investors if they pay too steep a price for admission.

CHAPTER 57

How Warren Determines It Is Time to Sell

In Warren's world you would never sell one of these wonderful businesses as long as it maintained its durable competitive advantage. The simple reason is that the longer you hold on to them, the better you do. Also, if at any time you sold one these great investments, you would be inviting the taxman to the party. Inviting the taxman to your party too many times makes it very hard to get superrich. Consider this: Warren's company has about $36 billion in capital gains from his investments in companies that have durable competitive advantages. This is wealth he hasn't yet paid a dime of tax on, and if he has it his way, he never will.

Still, there are times that it is advantageous to sell one of these wonderful businesses. The first is when you need money to make an investment in an even better company at a better price, which occasionally happens.

The second is when the company looks like it is going to

lose its durable competitive advantage. This happens periodically, as with newspapers and television stations. Both of them used to be fantastic businesses. But the Internet came along and suddenly the durability of their competitive advantage was called into question. A questionable competitive advantage is not where you want to keep your money long-term.

The third is during bull markets when the stock market, in an insane buying frenzy, sends the prices on these fantastic businesses through the ceiling. In these cases, the current selling price of the company's stock far exceeds the long-term economic realities of the business. And the long-term economic realities of a business are like gravity when stock prices climb up into the outer limits. Eventually they will pull the stock price back down to earth. If they climb too high, the economics of selling and putting the proceeds into another investment may outweigh the benefits afforded by continued ownership of the business. Think of it this way: If we can project that the business we own will earn $10 million over the next twenty years, and someone today offers us $5 million for the entire company, do we take it? If we can only invest the $5 million at a 2% annual compounding rate of return, probably not, since the $5 million invested today at a 2% compounding annual rate of return would be worth only $7.4 million by year twenty. Not a great deal for us. But if we could get an annual compounding rate of return of 8%, our $5 million would have grown to $23 mil-

lion by year twenty. Suddenly, selling out looks like a real sweet deal.

A simple rule is that when we see P/E ratios of 40 or more on these super companies, and it does occasionally happen, it just might be time to sell. But if we do sell into a raging bull market, then we shouldn't go out and buy something else trading at 40 times earnings. Instead, we should take a break, put our money into U.S. Treasuries and wait for the next bear market. Because there is always another bear market right around the corner, just waiting to give us the golden opportunity to buy into one or more of these amazing durable competitive advantage businesses that will, over the long-term, make us super superrich.

Just like Warren Buffett.

Select Glossary of Terms

AAA rating: The highest rating that Standard & Poor's gives to a company for its financial soundness.

It doesn't get any better than this. The company is golden if it gets this rating.

accounts receivable: Money owed to the company for goods sold that haven't been paid for yet.

Having lots of accounts receivable is a good thing, but having lots of cash is even better.

accumulated depreciation: The total of all depreciation, or decreases in value, that has been charged against an asset.

Accountants like to keep track of everything, including how much things depreciate. Think of accumulated depreciation as a very large trash can you can check to find how much the company's assets have depreciated.

amortization: Basically, the same as depreciation, but it applies to intangible assets such as goodwill and patents.

Depreciation applies to tangible assets such as a manufacturing plant. The problem with patents, for example, is that they

don't really depreciate, so the cost of the patent is spread out (amortized) over a number of years as a cost.

asset: Something that is owned by the business and is expected to be used to generate future income.

Having lots of assets is a good thing. Having lots of assets that produce lots of money is an even better thing.

balance sheet: A summary of a company's assets, liabilities, and ownership equity as of a specific date, such as the end of its fiscal year.

A balance sheet is often described as a snapshot of a company's financial condition on a single day within the year. There is no such thing as a balance sheet for a longer period of time. A balance sheet tells you how much you have and how much you owe. Subtract one from the other and you get how much you are worth.

bond: A security that represents long-term debt.

Companies with durable competitive advantages don't have a lot of bonds because they usually don't have a lot of debt. And not having a lot of debt is a good thing.

book value: All of the company's assets minus all of the company's liabilities. Divide this by the number of common shares outstanding, and you get the per-share book value of the company.

Increasing book value is a good thing; decreasing book value is a bad thing.

capital expenditures: The amount the company spends every year on building new or upgrading old infrastructure.

Companies with a durable competitive advantage tend to have low capital expenditures.

cash flow: The amount of cash generated by the company during a specific period. Cash flow for a company is tracked on the cash flow statement.

common stock: Securities that represent ownership in the business. Holders of common stock are entitled to elect a board of directors, receive dividends, and collect all the proceeds from the sale of a company after all of its debts have been paid.

Warren got rich by buying the common stock of companies.

competitive advantage: An edge over competitors that allows the company to make more money.

The more cash a company can generate, the happier its shareholders. Warren is only interested in companies that have a competitive advantage that can be maintained over a long period of time.

cost of goods sold: The cost of inventory sold during a specific period. Or the cost of obtaining raw goods and making finished products.

Low cost of goods sold relative to revenue is a good thing; high costs are a bad thing.

current assets: Assets—*things of value*—that are cash or are expected to be converted into cash within a year. These assets are found on the balance sheet and include cash, cash equivalents, accounts receivable, inventory, and prepaid expenses.

current liabilities: Money owed within a year.

current ratio: The ratio of current assets to current liabilities.

Current ratio is of little use in the search for the company with a durable competitive advantage.

depreciation: Tangible assets wear out as they are used. As they wear out, a depreciation charge is taken against the asset.

durable competitive advantage: A competitive advantage over a company's competitors that it can maintain for a long period of time.

This is the secret to Warren's success and the reason that you are reading this book.

EBITDA: Earnings before interest, taxes, depreciation, and amortization.

Companies that don't make money love EBITDA. Warren thinks that EBITDA is stupid. Whenever you hear management talking in terms of EBITDA, it means that they don't have a durable competitive advantage.

financial statement: The balance sheet, income statement, and cash flow statement.

This shows where all the goodies are kept, but you need to see them from a number of years if you really want to tell what is going on.

goodwill: The value of an asset in excess of the value that is carried on the books.

The company has a per-share book value of $10 and a selling price of $15 a share. The $5 in excess of the book value is booked as goodwill if the company was bought by another company.

gross margin: The ratio of total profit to sales.

The higher the better. Companies with a durable competitive advantage tend to have high gross margins.

gross profit: Proceeds on product sales. Sales minus cost of goods sold equals gross profit.

It's good to bounce other numbers off the gross profit.

income statement: The statement that shows a company's income and expenses for a specific period.

A single year's income statement tells us very little. We need to check out five-to-ten years' worth of income statements if we are really serious about finding out if the company has a durable competitive advantage.

intangible assets: Assets such as patents and copyrights, which can't be physically touched, but can generate income.

Think of these as monopolies protected by law, which is a

kind of durable competitive advantage. The only problem with patents is that they eventually expire, or lose their protection. When this happens, any and every company in the world can produce the product and the company loses the competitive advantage the patent once provided. This is the reason why Warren has historically stayed away from the drug manufacturers.

interest expense: The amount of money a company pays in interest on both its long- and short-term debt.

Companies without a durable competitive advantage tend to have a lot of interest expense because they have a lot of debt. Companies with a durable competitive advantage tend not to have any debt so they have little or no interest expense.

inventory: A company's products that are either completed or in some stage of completion and that will be sold to the company's customers.

If sales are decreasing and inventory is rising, watch out.

leverage: The amount of debt the company has in relation to the shareholders' equity.

The presence of a large amount of leverage over a long period of time usually means that the company doesn't have a durable competitive advantage.

liabilities: The obligations the company has to pay others.

Liabilities are listed on the company's balance sheet. They are

not a good thing to have. A company should strive to have as few as possible.

long-term debt: Debt that has a maturity date of longer than one year.

Companies with a durable competitive advantage tend to have little or no long-term debt.

mediocre business: A company that doesn't have a durable competitive advantage and suffers the intense pressures of competition.

This is the kind of company that will make you poor over the long run.

net income: The company's profit after all costs, expenses, and taxes are deducted from revenue.

The more net income, the better. The more consistent the net income, the more likely the company has a durable competitive advantage.

operating expenses: Costs of running the business that are not tied directly to the production costs of the company's products.

Lower is better.

operating profit: The company's earnings from ongoing operations. This is equal to earnings before deductions for interest payments and income taxes. Also called EBIT (earnings before interest and taxes) or operating income.

outstanding shares: Common stock held by investors. Does not include treasury shares, but does include restricted shares owned by corporate officers and insiders.

A dramatic increase in the number of shares outstanding over a number of years without an increase in the company's earnings usually means that the company is selling new shares to increase its capital base to make up for the fact that it is a mediocre business. Warren stays away from mediocre businesses.

preferred stock: Capital stock that provides a specific dividend and grants no voting rights.

Companies with a durable competitive advantage tend not to have any preferred stock.

prepaid expense: A current asset that represents an expense that was paid before or at the beginning of the accounting period in which the benefit of the expense will be received.

research and development expense: The amount of money a company spends in a given period of time on producing and improving new products.

Companies with a durable competitive advantage tend to have little or no research and development expenses.

retained earnings: Accumulated net earnings of the business that have not been paid out as a dividend.

A solid long-term growth in retained earnings is one of the marks of a company with a durable competitive advantage.

return on equity: A company's net income divided by its shareholders' equity.

This is one of the ways that Warren tells if the company has a durable competitive advantage. The higher the better.

revenues: Money received or that is due from the sale of the company's products or services.

Revenue is where it all starts, but it should never be used as the only way to value a business, unless you work on Wall Street and are trying to sell the public on a company that doesn't earn any money.

SGA costs: Selling, general, and administrative expenses, which report the company's costs for direct and indirect selling expenses and all general and administrative expenses that were incurred during the accounting period. This includes management salaries, advertising, travel costs, legal fees, commissions, all payroll costs, and the like.

Lower is better.

shareholders' equity: The net worth of the business. Total assets minus total liabilities equals shareholders' equity.

treasury shares: What is known as treasury stock in the United States is referred to as treasury shares in the United Kingdom.

treasury stock: The company's common stock that has been repurchased by the company. Treasury stock grants no voting

rights or the right to receive dividends and should not be included in the outstanding shares calculations.

Having treasury stock tells us that the company just might have a durable competitive advantage.

undervalued company: A company that is selling in the stock market at a price below its long-term worth as a business.

Benjamin Graham bought undervalued companies and made millions. Warren bought companies with a durable competitive advantage and made billions.

Acknowlwedgments

We owe a great debt to Warren Buffett for his kindness, generosity, and wisdom over the years. If we thanked him a million times it would not be enough.

We also are thankful that Scribner is our publishing house. We specifically wish to thank our publishers Susan Moldow and Roz Lippel, who have given us a great deal of freedom in the writing of this book. We also owe a very special thank-you to Roz for those finishing touches that only a great editor can add. We also wish to thank Tom Dussel for his brilliant handling of our international partners who publish our books.

We also wish to thank our retired publisher Eleanor Rawson, who had the vision to publish our first book, *Buffettology*.

I, Mary, wish to dedicate this book to the most important people in my life, my family. First, my children, Erica, Nicole, and Sam, who give me the most love and happiness, making me prouder of them every day. My sisters, Dorothy Manley, for always being there for me through thick and thin, and Laura Sir Mons, whom I still look to for the very important part of life, living it to the fullest. Jim Manley, my brother-in-law, who always inspires us to reach perfection by practice practice practice. . . .

I also wish to thank "Just" Joe Campbell, the kindest person I know and love; Jocelyn Skinner, my best friend, who keeps my world spinning; the amazing Richard Bangs, adventurer and true friend; Scott Daggatt, for his friendship and counsel extraordinaire; RitaWatnick and Michael Stoyla, for always believing in me and helping me at every turn; my new friend and brilliant mind Bob McElwee; the miraculous Debbie Levin for her friendship and the important work she does as president of the Environmental Media Association; Ken Spratford, my 911 "Buddy"; and Janos Kalla, for keeping me sane and for always being there. I also wish to thank Jay Hill, my co-blogger and the smartest girl I know. And a very special thank-you to the great musician/composer Ken Hankins, aka "Joy," who inspires me every day.

David wishes to thank Kate and Dexter for all their love, Sam and Andy for being great brothers, and Cindy Connolly and Bob Eisenberg for being the fantastic friends that they always have been. He owes a special gratitude to artists Terry Rosenberg and Steve Joy for always answering the call to coffee and to filmmaker Alexander Payne for many really great conversations. He gives a special thank-you to Todd Simon for a ton of things, including bringing Betiana and Mia into our lives.

David also wishes to thank Wyoming attorney Gerry Spence for his deep friendship and helpful guidance over many years. No man ever had a better or more interesting friend.

And last, but not least, we both wish to thank the late Benjamin Graham, who planted the tree we all came to sit under.

About the Authors

Mary Buffett is an internationally best-selling author and speaker on the investment methods of Warren Buffett. David Clark is an internationally recognized authority on the subject of Buffettology and the managing partner of a private investment group in Omaha, Nebraska. Together, they have written four best-selling books on the investment methods of Warren Buffett. Their books, *The Tao of Warren Buffett*, *The New Buffettology*, *The Buffettology Workbook*, and *Buffettology*, have been published in more than seventeen languages worldwide, including Chinese, Russian, Hebrew, and Arabic.

INTRODUCTION

Lawrence A. Cunningham

Experienced readers of Warren Buffett's letters to the shareholders of Berkshire Hathaway Inc. have gained an enormously valuable informal education. The letters distill in plain words all the basic principles of sound business practices. On selecting managers and investments, valuing businesses, and using financial information profitably, the writings are broad in scope, and long on wisdom.

Yet until now the letters existed in a format that was neither easily accessible nor organized in any thematic way. Consequently, the ideas have not been given the more widespread attention they deserve. The motivation for this compendium and for the symposium featuring it is to correct an inefficiency in the marketplace of ideas by disseminating the essays to a wider audience.

The central theme uniting Buffett's lucid essays is that the principles of fundamental valuation analysis, first formulated by his teachers Ben Graham and David Dodd, should guide investment practice. Linked to that theme are management principles that define the proper role of corporate managers as the stewards of invested capital, and the proper role of shareholders as the suppliers and owners of capital. Radiating from these main themes are practical and sensible lessons on mergers and acquisitions, accounting, and taxation.

Many of Buffett's lessons directly contradict what has been taught in business and law schools during the past thirty years, and what has been practiced on Wall Street and throughout corporate America during that time. Much of that teaching and practice eclipsed what Graham and Dodd had to say; Buffett is their prodigal pupil, stalwartly defending their views. The defenses run from an impassioned refutation of modern finance theory, to convincing demonstrations of the deleterious effects of using stock options to compensate managers, to persuasive arguments about the exaggerated benefits of synergistic acquisitions and cash flow analysis.

Buffett has applied the traditional principles as chief executive officer of Berkshire Hathaway, a company with roots in a group of textile operations begun in the early 1800s. Buffett took the helm of Berkshire in 1964, when its book value per share was $19.46 and its intrinsic value per share far lower. Today, its book value per share is around $20,000 and its intrinsic value far higher. The

growth rate in book value per share during that period is 23.8% compounded annually.

Berkshire is now a holding company engaged in a variety of businesses, not including textiles. Berkshire's most important business is insurance, carried on principally through its 100% owned subsidiary, GEICO Corporation, the seventh largest auto insurer in the United States. Berkshire publishes *The Buffalo News* and owns other businesses that manufacture or distribute products ranging from encyclopedias, home furnishings, and cleaning systems, to chocolate candies, ice cream, footwear, uniforms, and air compressors. Berkshire also owns substantial equity interests in major corporations, including American Express, Coca-Cola, Walt Disney, Freddie Mac, Gillette, McDonald's, The Washington Post, and Wells Fargo.

Buffett and Berkshire Vice Chairman Charlie Munger have built this $50 billion enterprise by investing in businesses with excellent economic characteristics and run by outstanding managers. While they prefer negotiated acquisitions of 100% of such a business at a fair price, they take a "double-barreled approach" of buying on the open market less than 100% of such businesses when they can do so at a pro-rata price well below what it would take to buy 100%.

The double-barreled approach has paid off handsomely. The value of marketable securities in Berkshire's portfolio, on a per share basis, increased from $4 in 1965 to over $22,000 in 1995, a 33.4% annual increase. Per share operating earnings increased in the same period from just over $4 to over $258, a 14.79% annual increase. These extraordinary results continue, in recent years increasing at similar rates. According to Buffett, these results follow not from any master plan but from focused investing-allocating capital by concentrating on businesses with outstanding economic characteristics and run by first-rate managers.

Buffett views Berkshire as a partnership among him, Munger and other shareholders, and virtually all his $15-plus billion net worth is in Berkshire stock. His economic goal is long-term-to maximize Berkshire's per share intrinsic value by owning all or part of a diversified group of businesses that generate cash and above-average returns. In achieving this goal, Buffett foregoes expansion for the sake of expansion and foregoes divestment of businesses so long as they generate some cash and have good management.

Berkshire retains and reinvests earnings when doing so delivers at least proportional increases in per share market value over time. It uses debt sparingly and sells equity only when it receives as much in value as it gives. Buffett penetrates accounting conventions, especially those that obscure real economic earnings.

These owner-related business principles, as Buffett calls them, are the organizing themes of the accompanying essays. As organized, the essays constitute an elegant and instructive manual on management, investment, finance, and accounting. Buffett's basic principles form the framework for a rich range of positions on the wide variety of issues that exist in all aspects of business. They go far beyond mere abstract platitudes. It is true that investors should focus on fundamentals, be patient, and exercise good judgment based on common sense. In Buffett's essays, these advisory tidbits are anchored in the more concrete principles by which Buffett lives and thrives.

Many people speculate on what Berkshire and Buffett are doing or plan to do. Their speculation is sometimes right and sometimes wrong, but always foolish. People would be far better off not attempting to ferret out what specific investments are being made at Berkshire, but thinking about how to make sound investment selections based on Berkshire's teaching. That means they should think about Buffett's writings and learn from them, rather than try to emulate Berkshire's portfolio.

Buffett modestly confesses that most of the ideas expressed in his essays were taught to him by Ben Graham. He considers himself the conduit through which Graham's ideas have proven their value. In allowing me to prepare this material, Buffett said that I could be the popularizer of Graham's ideas and Buffett's application of them. Buffett recognizes the risk of popularizing his business and investment philosophy. But he notes that he benefited enormously from Graham's intellectual generosity and believes it is appropriate that he pass the wisdom on, even if that means creating investment competitors. To that end, my most important role has been to organize the essays around the themes reflected in this collection. This introduction to the major themes encapsulates the basics and locates them in the context of current thinking. The essays follow.

CORPORATE GOVERNANCE

For Buffett, managers are stewards of shareholder capital. The best managers think like owners in making business decisions.

They have shareholder interests at heart. But even first-rate managers will sometimes have interests that conflict with those of shareholders. How to ease those conflicts and to nurture managerial stewardship have been constant objectives of Buffett's forty-year career and a prominent theme of his essays. The essays address some of the most important governance problems.

The first is not dwelt on in the essays but rather permeates them: it is the importance of forthrightness and candor in communications by managers to shareholders. Buffett tells it like it is, or at least as he sees it. That quality attracts an interested shareholder constituency to Berkshire, which flocks to its annual meetings in increasing numbers every year. Unlike what happens at most annual shareholder meetings, a sustained and productive dialogue on business issues results.

Besides the owner-orientation reflected in Buffett's disclosure practice and the owner-related business principles summarized above, the next management lesson is to dispense with formulas of managerial structure. Contrary to textbook rules on organizational behavior, mapping an abstract chain of command on to a particular business situation, according to Buffett, does little good. What matters is selecting people who are able, honest, and hard-working. Having first-rate people on the team is more important than designing hierarchies and clarifying who reports to whom about what and at what times.

Special attention must be paid to selecting a CEO because of three major differences Buffett identifies between CEOs and other employees. First, standards for measuring a CEO's performance are inadequate or easy to manipulate, so a CEO's performance is harder to measure than that of most workers. Second, no one is senior to the CEO, so no senior person's performance can be measured either. Third, a board of directors cannot serve that senior role since relations between CEOs and boards are conventionally congenial.

Major reforms are often directed toward aligning management and shareholder interests or enhancing board oversight of CEO performance. Stock options for management were touted as one method; greater emphasis on board processes was another. Separating the identities and functions of the Chairman of the Board and the CEO or appointment of standing audit, nominating and compensation committees were also heralded as promising reforms. None of these innovations has solved governance problems, however, and some have exacerbated them.

The best solution, Buffett instructs, is to take great care in identifying CEOs who will perform capably regardless of weak structural restraints. Outstanding CEOs do not need a lot of coaching from owners, although they can benefit from having a similarly outstanding board. Directors therefore must be chosen for their business savvy, their interest, and their owner-orientation. According to Buffett, one of the greatest problems among boards in corporate America is that members are selected for other reasons, such as adding diversity or prominence to a board.

Most reforms are painted with a broad brush, without noting the major differences among types of board situations that Buffett identifies. For example, director power is weakest in the case where there is a controlling shareholder who is also the manager. When disagreements arise between the directors and management, there is little a director can do other than to object and, in serious circumstances, resign. Director power is strongest at the other extreme, where there is a controlling shareholder who does not participate in management. The directors can take matters directly to the controlling shareholder when disagreement arises.

The most common situation, however, is a corporation without a controlling shareholder. This is where management problems are most acute, Buffett says. It would be helpful if directors could supply necessary discipline, but board congeniality usually prevents that. To maximize board effectiveness in this situation, Buffett believes the board should be small in size and composed mostly of outside directors. The strongest weapon a director can wield in these situations remains his or her threat to resign.

All these situations do share a common characteristic: the terrible manager is a lot easier to confront or remove than the mediocre manager. A chief problem in all governance structures, Buffett emphasizes, is that in corporate America evaluation of chief executive officers is never conducted in regular meetings in the absence of that chief executive. Holding regular meetings without the chief executive to review his or her performance would be a marked improvement in corporate governance.

Evaluating CEO performance is even harder than it may seem. Both short-term results and potential long-term results must be assessed. If only short-term results mattered, many managerial decisions would be much easier, particularly those relating to businesses whose economic characteristics have eroded. For an extreme but not atypical example, consider Al Dunlap's aggressive plan to turn around ailing Sunbeam. Dunlap fired half of Sun-

beam's workers and closed or consolidated more than half its facilities, including some engaged in the textile business in New England. Boasting that he was attacking the entire company, Dunlap declared that his plan was as carefully plotted as the invasion of Normandy. Driven solely by the primacy of the short-term bottom line, that decision was easy.

The decision is much harder, however, if you recognize that superior long-term results can flow from earning the trust of social communities, as Buffett's consideration of the anxieties of plant closings suggests. The economic characteristics of Berkshire's old textile business had begun to erode by the late 1970s. Buffett had hoped to devise a reversal of its misfortunes, noting how important Berkshire's textile business was to its employees and local communities in New England, and how able and understanding management and labor had been in addressing the economic difficulties. Buffett kept the ailing plant alive through 1985, but a financial reversal could not be achieved and Buffett eventually closed it. Whether Buffett would approve of Dunlap-style short-termism is not clear, but his own style of balancing short-term results with long-term prospects based on community trust is certainly different. It is not easy, but it is intelligent.

Sometimes management interests conflict with shareholder interests in subtle or easily disguised ways. Take corporate philanthropy, for example. At most major corporations, management allocates a portion of corporate profit to charitable concerns. The charities are chosen by management, for reasons often unrelated either to corporate interests or shareholder interests. Most state laws permit management to make these decisions, so long as aggregate annual donations are reasonable in amount, usually not greater than 10% of annual net profits.

Berkshire does things differently. Shareholders designate charities to which the corporation donates. Nearly all shareholders participate in allocating millions of dollars per year to charitable organizations of their choice. This is an imaginative practical response to a tension that is at the core of the management-shareholder relationship. It is surprising that other American corporations do not follow this model of corporate charitable giving. Part of the reason may be the lack of long-term ownership orientation that characterizes the shareholder profiles of many American corporations. If so, this demonstrates a cost of the short-term mentality of America's investment community.

The plan to align management and shareholder interests by awarding executives stock options not only was oversold, but also subtly disguised a deeper division between those interests that the options created. Many corporations pay their managers stock options whose value increases simply by retention of earnings, rather than by superior deployment of capitaL As Buffett explains, however, simply by retaining and reinvesting earnings, managers can report annual earnings increases without so much as lifting a finger to improve real returns on capitaL Stock options thus often rob shareholders of wealth and allocate the booty to executives. Moreover, once granted, stock options are often irrevocable, unconditional, and benefit managers without regard to individual performance.

It is possible to use stock options to instill a managerial culture that encourages owner-like thinking, Buffett agrees. But the alignment will not be perfect. Shareholders are exposed to the downside risks of sub-optimal capital deployment in a way that an option holder is not. Buffett therefore cautions shareholders who are reading proxy statements about approving option plans to be aware of the asymmetry in this kind of alignment. Many shareholders rationally ignore proxy statements, but this subject should really be on the front-burner of shareholders, particularly shareholder institutions that periodically engage in promoting corporate governance improvements.

Buffett emphasizes that performance should be the basis for executive pay decisions. Executive performance should be measured by profitability, after profits are reduced by a charge for the capital employed in the relevant business or earnings retained by it. If stock options are used, they should be related to individual performance, rather than corporate performance, and priced based on business value. Better yet, as at Berkshire, stock options should simply not be part of an executive's compensation. After all, exceptional managers who earn cash bonuses based on the performance of their own business can simply buy stock if they want to; if they do, they "truly walk in the shoes of owners," Buffett says.

CORPORATE FINANCE AND INVESTING

The most revolutionary investing ideas of the past thirty years were those called modern finance theory. This is an elaborate set of ideas that boil down to one simple and misleading practical implication: it is a waste of time to study individual investment opportunities in public securities. According to this view, you will do

better by randomly selecting a group of stocks for a portfolio by throwing darts at the stock tables than by thinking about whether individual investment opportunities make sense.

One of modern finance theory's main tenets is modern portfolio theory. It says that you can eliminate the peculiar risk of any security by holding a diversified portfolio-that is, it formalizes the folk slogan "don't put all your eggs in one basket." The risk that is left over is the only risk for which investors will be compensated, the story goes.

This leftover risk can be measured by a simple mathematical term-called beta-that shows how volatile the security is compared to the market. Beta measures this volatility risk well for securities that trade on efficient markets, where information about publicly traded securities is swiftly and accurately incorporated into prices. In the modern finance story, efficient markets rule.

Reverence for these ideas was not limited to ivory tower academics, in colleges, universities, business schools, and law schools, but became·standard dogma throughout financial America in the past thirty years, from Wall Street to Main Street. Many professionals still believe that stock market prices always accurately reflect fundamental values, that the only risk that matters is the volatility of prices, and that the best way to manage that risk is to invest in a diversified group of stocks.

Being part of a distinguished line of investors stretching back to Graham and Dodd which debunks standard dogma by logic and experience, Buffett thinks most markets are not purely efficient and that equating volatility with risk is a gross distortion. Accordingly, Buffett worried that a whole generation of MBAs and lDs, under the influence of modern finance theory, was at risk of learning the wrong lessons and missing the important ones.

A particularly costly lesson of modern finance theory came from the proliferation of portfolio insurance-a computerized technique for readjusting a portfolio in declining markets. The promiscuous use of portfolio insurance helped precipitate the stock market crash of October 1987, as well as the market break of October 1989. It nevertheless had a silver lining: it shattered the modern finance story being told in business and law schools and faithfully being followed by many on Wall Street. Ensuing market volatility could not be explained by modern finance theory, nor could mountainous other phenomena relating to the behavior of small capitalization stocks, high dividend-yield stocks, and stocks with low price-earnings ratios. Growing numbers of skeptics

emerged to say that beta does not really measure the investment risk that matters, and that capital markets are really not efficient enough to make beta meaningful anyway.

In stirring up the discussion, people started noticing Buffett's record of successful investing and calling for a return to the Graham-Dodd approach to investing and business. After all, for more than forty years Buffett has generated average annual returns of 20% or better, which double the market average. For more than twenty years before that, Ben Graham's Graham-Newman Corp. had done the same thing. As Buffett emphasizes, the stunning performances at Graham-Newman and at Berkshire deserve respect: the sample sizes were significant; they were conducted over an extensive time period, and were not skewed by a few fortunate experiences; no data-mining was involved; and the performances were longitudinal, not selected by hindsight.

Threatened by Buffett's performance, stubborn devotees of modern finance theory resorted to strange explanations for his success. Maybe he is just lucky-the monkey who typed out Hamlet-or maybe he has inside access to information that other investors do not. In dismissing Buffett, modern finance enthusiasts still insist that an investor's best strategy is to diversify based on betas or dart throwing, and constantly reconfigure one's portfolio of investments.

Buffett responds with a quip and some advice: the quip is that devotees of his investment philosophy should probably endow chairs to ensure the perpetual teaching of efficient market dogma; the advice is to ignore modern finance theory and other quasi-sophisticated views of the market and stick to investment knitting. That can best be done for many people through long-term investment in an index fund. Or it can be done by conducting hard-headed analyses of businesses within an investor's competence to evaluate. In that kind of thinking, the risk that matters is not beta or volatility, but the possibility of loss or injury from an investment.

Assessing that kind of investment risk requires thinking about a company's management, products, competitors, and debt levels. The inquiry is whether after-tax returns on an investment are at least equal to the purchasing power of the initial investment plus a fair rate of return. The primary relevant factors are the long-term economic characteristics of a business, the quality and integrity of its management, and future levels of taxation and inflation. Maybe these factors are vague, particularly compared with the seductive

precision of beta, but the point is that judgments about such matters cannot be avoided, except to an investor's disadvantage.

Buffett points out the absurdity of beta by observing that "a stock that has dropped very sharply compared to the market ... becomes 'riskier' at the lower price than it was at the higher price"-that is how beta measures risk. Equally unhelpful, beta cannot distinguish the risk inherent in "a single-product toy company selling pet rocks or hula hoops from another toy company whose sole product is Monopoly or Barbie." But ordinary investors can make those distinctions by thinking about consumer behavior and the way consumer products companies compete, and can also figure out when a huge stock-price drop signals a buying opportunity.

Contrary to modern finance theory, Buffett's investment knitting does not prescribe diversification. It may even call for concentration, if not of one's portfolio, then at least of its owner's mind. As to concentration of the portfolio, Buffett reminds us that Keynes, who was not only a brilliant economist but also a brilliant investor, believed that an investor should put fairly large sums into two or three businesses he knows something about and whose management is trustworthy. On that view, risk rises when investments and investment thinking are spread too thin. A strategy of financial and mental concentration may reduce risk by raising both the intensity of an investor's thinking about a business and the comfort level he must have with its fundamental characteristics before buying it.

The fashion of beta, according to Buffett, suffers from inattention to "a fundamental principle: It is better to be approximately right than precisely wrong." Long-term investment success depends not on studying betas and maintaining a diversified portfolio, but on recognizing that as an investor, one is the owner of a business. Reconfiguring a portfolio by buying and selling stocks to accommodate the desired beta-risk profile defeats long-term investment success. Such "flitting from flower to flower" imposes huge transaction costs in the forms of spreads, fees and commissions, not to mention taxes. Buffett jokes that calling someone who trades actively in the market an investor "is like calling someone who repeatedly engages in one-night stands a romantic." Investment knitting turns modern finance theory's folk wisdom on its head: instead of "don't put all your eggs in one basket," we get Mark Twain's advice from Pudd'nhead Wilson: "Put all your eggs in one basket-and watch that basket."

Buffett learned the art of investing from Ben Graham as a graduate student at Columbia Business School in the 1950s and later working at Graham-Newman. In a number of classic works, including *The Intelligent Investor,* Graham introduced some of the most profound investment wisdom in history. It rejects a prevalent but mistaken mind-set that equates price with value. On the contrary, Graham held that price is what you pay and value is what you get. These two things are rarely identical, but most people rarely notice any difference.

One of Graham's most profound contributions is a character who lives on Wall Street, Mr. Market. He is your hypothetical business partner who is daily willing to buy your interest in a business or sell you his at prevailing market prices. Mr. Market is moody, prone to manic swings from joy to despair. Sometimes he offers prices way higher than value; sometimes he offers prices way lower than value. The more manic-depressive he is, the greater the spread between price and value, and therefore the greater the investment opportunities he offers. Buffett reintroduces Mr. Market, emphasizing how valuable Graham's allegory of the overall market is for disciplined investment knitting-even though Mr. Market would be unrecognizable to modern finance theorists.

Another leading prudential legacy from Graham is his margin-of-safety principle. This principle holds that one should not make an investment in a security unless there is a sufficient basis for believing that the price being paid is substantially lower than the value being delivered. Buffett follows the principle devotedly, noting that Graham had said that if forced to distill the secret of sound investment into three words, they would be: margin of safety. Over forty years after first reading that, Buffett still thinks those are the right words. While modern finance theory enthusiasts cite market efficiency to deny there is a difference between price (what you pay) and value (what you get), Buffett and Graham regard it as all the difference in the world.

That difference also shows that the term "value investing" is a redundancy. All true investing must be based on an assessment of the relationship between price and value. Strategies that do not employ this comparison of price and value do not amount to investing at all, but to speculation-the hope that price will rise, rather than the conviction that the price being paid is lower than the value being obtained. Many professionals make another common mistake, Buffett notes, by distinguishing between "growth in-

vesting" and "value investing." Growth and value, Buffett says, are not distinct. They are integrally linked since growth must be treated as a component of value.

Nor does the phrase "relational investing" resonate with Buffett. The term became popular on Wall Street and in the academy in the mid-1990s, describing a style of investing that is designed to reduce the costs of the separation of shareholder ownership from managerial control by emphasizing shareholder involvement and monitoring of management. Many people incorrectly identified Buffett and Berkshire as exemplars of this descriptive label. It is true that Buffett buys big blocks in a few companies and sticks around a long time. He also only invests in businesses run by people he trusts. But that is about as far as the similarity goes. If Buffett were pressed to use an adjective to describe his investment style, it would be something like "focused" or "intelligent" investing. Yet even these words ring redundant; the unadorned term *investor* best describes Buffett.

Other misuses of terms include blurring the difference between speculation and arbitrage as methods of sound cash management; the latter being very important for companies like Berkshire that generate substantial excess cash. Both speculation and arbitrage are ways to use excess cash rather than hold it in short-term cash equivalents such as commercial paper. Speculation describes the use of cash to bet on lots of corporate events based on rumors of unannounced coming transactions. Arbitrage, traditionally understood to mean exploiting different prices for the same thing on two different markets, for Buffett describes the use of cash to take short-term positions in a few opportunities that have been publicly announced. It exploits different prices for the same thing at different times. Deciding whether to employ cash this way requires evaluating four common-sense questions based on information rather than rumor: the probability of the event occurring, the time the funds will be tied up, the opportunity cost, and the downside if the event does not occur.

In all investment thinking, one must guard against what Buffett calls the "institutional imperative." It is a pervasive force in which institutional dynamics produce resistance to change, absorption of available corporate funds, and reflexive approval of suboptimal CEO strategies by subordinates. Contrary to what is often taught in business and law schools, this powerful force often interferes with rational business decision-making. The ultimate result of the institutional imperative is a follow-the-pack mentality pro-

ducing industry imitators, rather than industry leaders-what Buffett calls a lemming-like approach to business.

All these investment principles are animated in Buffett's lively essays on junk and zero-coupon bonds and preferred stock. Challenging both Wall Street and the academy, Buffett again draws on Graham's ideas to reject the "dagger thesis" advanced to defend junk bonds. The dagger thesis, using the metaphor of the intensified care an automobile driver would take facing a dagger mounted on the steering wheel, overemphasizes the disciplining effect that enormous amounts of debt in a capital structure exerts on management.

Buffett points to the large numbers of corporations that failed in the early 1990s recession under crushing debt burdens to dispute academic research showing that higher interest rates on junk bonds more than compensated for their higher default rates. He attributes this error to a flawed assumption recognizable to any first-year statistics student: that historical conditions prevalent during the study period would be identical in the future. They would not. Further illuminating the folly of junk bonds is an essay in this collection by Charlie Munger that discusses Michael Milken's approach to finance.

Wall Street tends to embrace ideas based on revenue-generating power, rather than on financial sense, a tendency that often perverts good ideas to bad ones. In a history of zero-coupon bonds, for example, Buffett shows that they can enable a purchaser to lock in a compound rate of return equal to a coupon rate that a normal bond paying periodic interest would not provide. Using zero-coupons thus for a time enabled a borrower to borrow more without need of additional free cash flow to pay the interest expense. Problems arose, however, when zero-coupon bonds started to be issued by weaker and weaker credits whose free cash flow could not sustain increasing debt obligations. Buffett laments, "as happens in Wall Street all too often, what the wise do in the beginning, fools do in the end."

The essays on preferred stock show the art of investing at its finest, emphasizing the economic characteristics of businesses, the quality of management, and the difficult judgments that are always necessary, but not always correct.

COMMON STOCK

Buffett recalls that on the day Berkshire listed on the New York Stock Exchange in 1988, he told Jimmy Maguire, the special-

ist in Berkshire stock, "I will consider you an enormous success if the next trade in this stock is about two years from now." While Buffett jokes that Maguire "didn't seem to get enthused about that," he emphasizes that his mind-set when he buys any stock is "if we aren't happy owning a piece of that business with the Exchange closed, we're not happy owning it with the Exchange open." Berkshire and Buffett are investors for the long haul; Berkshire's capital structure and dividend policy prove it.

Unlike many CEOs, who desire their company's stock to trade at the highest possible prices in the market, Buffett prefers Berkshire stock to trade at or around its intrinsic value-neither materially higher nor lower. Such linkage means that business results during one period will benefit the people who owned the company during that period. Maintaining the linkage requires a shareholder group with a collective long-term, business-oriented investment philosophy, rather than a short-term, market-oriented strategy.

Buffett notes Phil Fisher's suggestion that a company is like a restaurant, offering a menu that attracts people with particular tastes. Berkshire's long-term menu emphasizes that the costs of trading activity can impair long-term results. Indeed, Buffett estimates that the transaction costs of actively traded stocks-broker commissions and market-maker spreads-often amount to 10% or more of earnings. Avoiding or minimizing such costs is necessary for long-term investment success, and Berkshire's listing on the New York Stock Exchange helped contain those costs.

Corporate dividend policy is a major capital allocation issue, always of interest to investors but infrequently explained to them. Buffett's essays clarify this subject, emphasizing that "capital allocation is crucial to business and investment management." In early 1998, Berkshire's common stock was priced in the market at over $50,000 per share and the company's book value, earnings, and intrinsic value have steadily increased well in excess of average annual rates. Yet the company has never effected a stock split, and has not paid a cash dividend in three decades.

Apart from reflecting the long-term menu and minimization of transaction costs, Berkshire's dividend policy also reflects Buffett's conviction that a company's earnings payout versus retention decision should be based on a single test: each dollar of earnings should be retained if retention will increase market value by at least a like amount; otherwise it should be paid out. Earnings retention is justified only when "capital retained produces incremental earnings equal to, or above, those generally available to investors."

Like many of Buffett's simple rules, this one is often ignored by corporate managers, except of course when they make dividend decisions for their subsidiaries. Earnings are often retained for non-owner reasons, such as expanding the corporate empire or furnishing operational comfort for management.

Things are so different at Berkshire, Buffett said at the symposium, that under his test Berkshire "might distribute more than 100% of the earnings," to which Charlie Munger chimed in "You're damn right." That has not been necessary, however, for throughout Buffett's stewardship at Berkshire, opportunities for superior returns on capital have been discovered, and exploited.

Stock splits are another common action in corporate America that Buffett points out disserve owner interests. Stock splits have three consequences: they increase transaction costs by promoting high share turnover; they attract shareholders with short-term, market-oriented views who unduly focus on stock market prices; and, as a result of both of those effects, they lead to prices that depart materially from intrinsic business value. With no offsetting benefits, splitting Berkshire's stock would be foolish. Not only that, Buffett adds, it would threaten to reverse three decades of hard work that has attracted to Berkshire a shareholder group comprised of more focused and long-term investors than probably any other major public corporation.

Two important consequences have followed from Berkshire's high stock price and its dividend policy. First, the extraordinarily high share price impaired the ability of Berkshire shareholders to effect gifts of their equity interest to family members or friends, though Buffett has offered a few sensible strategies like bargain sales to donees to deal with that. Second, Wall Street engineers tried to create securities that would purport to mimic Berkshire's performance and that would be sold to people lacking an understanding of Berkshire, its business, and its investment philosophy.

In response to these consequences, Buffett and Berkshire did an ingenious thing. In mid-1996, Berkshire effected a recapitalization by creating a new class of stock, called the Class B shares, and sold it to the public. The Class B shares have 1I30th the rights of the existing Class A shares, except with respect to voting rights they have 1/200th of those of the A shares; and the Class B shares are not eligible to participate in the Berkshire charitable contributions program. Accordingly, the Class B shares should (and do) trade somewhere in the vicinity of 1I30th of the market price of the Class A shares.

The Class A shares are convertible into Class B shares, giving Berkshire shareholders a do-it-yourself mechanism to effect a stock-split to facilitate gift giving and so on. More importantly, the Berkshire recapitalization would halt the marketing of Berkshire clones that contradict all the basic principles Buffett believes in. These clones-investment trusts that would buy and sell Berkshire shares according to demand for units in the trust-would have imposed costs on shareholders. If held by people who do not understand Berkshire's business or philosophy, they would have caused spikes in Berkshire's stock price, producing substantial deviations between price and value.

The Class B shares are designed to be attractive only to investors who share Buffett's philosophy of focused investing. For example, in connection with the offering of the Class B shares, Buffett and Munger emphasized that Berkshire stock was, at that time, not undervalued in the market. They said that neither of them would buy the Class A shares at the market price nor the Class B shares at the offering price. The message was simple: do not buy these securities unless you are prepared to hold them for the long term. The effort to attract only long-term investors to the Class B shares appears to have worked: trading volume in the shares after the offering was far below average for Big Board stocks.

Some expressed surprise at Buffett and Munger's cautionary statement, since most managers tell the market that newly-issued equity in their companies is being offered at a very good price. You should not be surprised by Buffett and Munger's disclosure, however. A company that sells its stock at a price less than its value is stealing from its existing shareholders. Quite plausibly, Buffett considers that a crime.

MERGERS AND ACQUISITIONS

Berkshire's acquisition policy is the double-barreled approach: buying portions or all of businesses with excellent economic characteristics and run by managers Buffett and Munger like, trust, and admire. Contrary to common practice, Buffett argues that in buying all of a business, there is rarely any reason to pay a premium.

The rare cases involve businesses with franchise characteristics-those that can raise prices rather easily and only require incremental capital investment to increase sales volume or market share. Even ordinary managers can operate franchise businesses to generate high returns on capital. The second category of rare cases

is where extraordinary managers exist who can achieve the difficult feat of identifying underperforming businesses, and apply extraordinary talent to unlock hidden value.

These two categories are extremely limited, and certainly do not explain the hundreds of high-premium takeovers that occur annually. Buffett attributes high-premium takeovers outside those unusual categories to three motives of buying-managers: the thrill of an acquisition, the thrill of enhanced size, and excessive optimism about synergies.

In paying for acquisitions, Berkshire issues stock only when it receives as much in business value as it gives. Many other buyers, when not using cash or debt, violate this simple rule. Buffett notes that sellers in stock acquisitions measure the purchase price by the market price of the buyer's stock, not by its intrinsic value. If a buyer's stock is trading at a price equal to, say, half its intrinsic value, then a buyer who goes along with that measure gives twice as much in business value as it is getting. Its manager, usually rationalizing his or her actions by arguments about synergies or size, is elevating thrill or excessive optimism above shareholder interests.

Moreover, acquisitions paid for in stock are too often (almost always) described as "buyer buys seller" or "buyer acquires seller." Buffett suggests clearer thinking would follow from saying "buyer sells part of itself to acquire seller," or something of the sort. After all, that is what is happening; and it would enable one to evaluate what the buyer is giving up to make the acquisition.

If the worst thing to do with undervalued stock is to use it to pay for an acquisition, the best thing is to buy it back. Obviously, if a stock is selling in the market at half its intrinsic value, the company can buy $2 in value by paying $1 in cash. There would rarely be better uses of capital than that. Yet many more undervalued shares are paid to effect value-destroying stock acquisitions than are repurchased in value-enhancing stock buy-backs.

In contrast to sensible repurchases of undervalued stock, which serve owner interests, Buffett condemns management repurchases from individuals at premium prices to fend off unwanted acquisition overtures. Buffett forcibly shows that this practice of greenmail is simply another form of corporate robbery.

Nearly as reprehensible, a second Charlie Munger essay in this collection explains, were the cascades of leveraged buy-outs in the 1980s. Permissive laws made LBOs hugely profitable, Munger tells us, but the LBOs weakened corporations, put a heavy premium on

cash generation to pay for enormous debt obligations, and raised the average cost of acquisitions.

Value-enhancing acquisitions are hard enough to find without the added burden of higher average costs for all of them. Indeed, most acquisitions are value-decreasing, Buffett says. Finding the best value-enhancing transactions requires concentrating on opportunity costs, measured principally against the alternative of buying small pieces of excellent businesses through stock market purchases. Such concentration is alien to the manager obsessed with synergies and size, but a vital part of Berkshire's double-barreled investment approach.

Berkshire has additional advantages in acquisitions: a high quality stock to pay with and a substantial amount of managerial autonomy to offer once a deal is done-both rare in an acquiring company, Buffett says. Buffett also puts his money where his mouth is, reminding prospective sellers that Berkshire has acquired many of its businesses from family or other closely-held groups, and inviting them to check with every previous seller about Berkshire's initial promises measured against its later actions.

ACCOUNTING AND TAXATION

Buffett's essays provide an entertaining and illuminating tutorial on understanding and using financial information. In dissecting significant aspects of generally accepted accounting principles (GAAP), Buffett shows both their importance and limits in understanding any business or investment. Buffett demystifies key topics that highlight the important differences between accounting earnings and economic earnings, between accounting goodwill and economic goodwill, and between accounting book value and intrinsic value. These are essential tools for any investor's or manager's valuation toolbox.

The most basic point to understand about accounting is that it is a form. As a form, it can be manipulated. Buffett shows just how severe the manipulation can be with a satire written by Ben Graham in the 1930s. The advanced bookkeeping methods Graham presents enable his phantom US Steel to report "phenomenally enhanced" earnings without cash outlays or changes in operating conditions or sales. Except in its lampooning spirit, Graham's illustration of accounting chicanery is not all that different from what is often seen coming out of corporate America.

Buffett emphasizes that useful financial statements must enable a user to answer three basic questions about a business: ap-

proximately how much a company is worth, its likely ability to meet its future obligations, and how good a job its managers are doing in operating the business. Buffett laments that GAAP conventions make these determinations difficult, and indeed almost any accounting system will be hard pressed to furnish completely accurate answers given the complexities of business. Acknowledging the monumental difficulty of inventing an accounting system superior to GAAP, Buffett articulates a range of concepts that go a longer way toward making financial information useful to investors and managers.

Consider a concept Buffett calls "look-through earnings." GAAP investment accounting calls for using the consolidation method for majority-owned equity, which means full reporting of all line items from the investee's financial statements on the parent's. For equity investments from 20% to 50%, GAAP calls for reporting the investor's proportionate share of earnings of the investee on its statements; for investments of less than 20%, GAAP provides that only dividends actually received by the investor be recorded, rather than any share of the investee's earnings. These accounting rules obscure a major factor in Berkshire's economic performance: the earnings generated by its investee companies are an enormous part of Berkshire's value, but would not be reported on its financial statements prepared using GAAP.

Recognizing that it is not the size of an equity investment that determines its value, but how the undistributed earnings are deployed, Buffett develops the concept of look-through earnings to gauge Berkshire's economic performance. Look-through earnings add to Berkshire's own net earnings the undistributed earnings in investee companies, less an incremental amount for taxes. Look-through earnings are not different from GAAP earnings for many businesses. But they are for Berkshire and probably are for many individual investors. Accordingly, individuals can adopt a similar approach for their own portfolios and try to design a portfolio that delivers the highest possible look-through earnings over the long term.

The difference between accounting goodwill and economic goodwill is well-known, but Buffett's lucidity makes the subject refreshing. Accounting goodwill is essentially the amount by which the purchase price of a business exceeds the fair value of the assets acquired (after deducting liabilities). It is recorded as an asset on the balance sheet and then amortized as an annual expense, usually

over forty years. So the accounting goodwill assigned to that business decreases over time by the aggregate amount of that expense.

Economic goodwill is something else. It is the combination of intangible assets, like brand name recognition, that enable a business to produce earnings on tangible assets, like plant and equipment, in excess of average rates. The amount of economic goodwill is the capitalized value of that excess. Economic goodwill tends to increase over time, at least nominally in proportion to inflation for mediocre businesses, and more than that for businesses with solid economic or franchise characteristics. Indeed, businesses with more economic goodwill relative to tangible assets are hurt far less by inflation than businesses with less of that.

These differences between accounting goodwill and economic goodwill entail the following insights. First, the best guide to the value of a business's economic goodwill is what it can earn on unleveraged net tangible assets, excluding charges for amortization of goodwill. Therefore when a business acquires other businesses, and the acquisitions are reflected in an asset account called goodwill, analysis of that business should ignore the amortization charges. Second, since economic goodwill should be measured at its full economic cost, i.e., before amortization, evaluation of a possible business acquisition should be conducted without regard to those amortization charges as well.

Buffett emphasizes, however, that the same does not hold for depreciation charges-these should not be ignored because they are real economic costs. He makes this point in explaining why Berkshire always shows its shareholders the results of operations with respect to acquired businesses net of any purchase price adjustments GAAP requires.

It is common on Wall Street to value businesses using a calculation of cash flows equal to *(a)* operating earnings plus *(b)* depreciation expense and other non-cash charges. Buffett regards that calculation as incomplete. After taking *(a)* operating earnings and adding back *(b)* non-cash charges, Buffett argues that you must then subtract something else: *(c)* required reinvestment in the business. Buffett defines *(c)* as "the average amount of capitalized expenditures for plant and equipment, etc., that the business requires to fully maintain its long-term competitive position and its unit volume." Buffett calls the result of *(a)* + *(b)* - *(c)* "owner earnings."

When *(b)* and *(c)* differ, cash flow analysis and owner earnings analysis differ too. For most businesses, *(c)* usually exceeds *(b),* so cash flow analysis usually overstates economic reality. In all cases

where (c) differs from *(b),* calculation of owner earnings enables one to appraise performance more accurately than would analysis of GAAP earnings, or cash flows affected by purchase price accounting adjustments. That is why Berkshire supplementally reports owner earnings for its acquired businesses, rather than rely solely on GAAP earnings figures, or cash flow figures.

A final example of Buffett's specialized toolkit is intrinsic value, "the discounted value of the cash that can be taken out of a business during its remaining life." Though simple to state, calculating intrinsic value is neither easy nor objective. It depends on estimation of both future cash flows and interest rate movements. But it is what ultimately matters about a business. Book value, in contrast, is easy to calculate, but of limited use. So too with market price, at least for most companies. Differences between intrinsic value and book value and market price may be hard to pin down. They can go either way, but there will almost certainly be differences.

GAAP has enough trouble. Yet two groups of people make it worse: those who try to overcome GAAP requirements by stretching their accounting imagination, and those who deliberately employ GAAP to facilitate financial fraud. The former is especially hard to deal with, as Buffett suggests in illustrating how debate on accounting for retiree benefits and stock options revealed the parochialism of many executives and accountants. For example, criticizing the view against treating stock options as expenses when granted, Buffett delivers this laconic argument: "If options aren't a form of compensation, what are they? If compensation isn't an expense, what is? And, if expenses shouldn't go into the calculation of earnings, where in the world should they go?"

Parochial positions on accounting can be economically disastrous, as the debate over accounting for retiree health care benefits attests. Until 1992, businesses that promised to pay for health care services to retired employees were not required by GAAP to record the associated obligation as a liability on their balance sheets. It thus made it easy to make such financial commitments, and many businesses made far more generous commitments to cover retiree health benefits than they would have had they been required to report the obligation. One consequence was a wave of bankruptcies, as businesses failed to meet their mounting and maturing obligations.

One clear lesson from Buffett's discussions of financial information is that accounting has inherent limits, even though it is ab-

solutely essential. Despite enormous managerial leeway in reporting earnings and potential abuse, financial information can be of great use to investors. Buffett uses it every day, and has allocated billions of dollars doing it. So it is possible to make important investment decisions on the basis of available financial information if one exercises knowledgeable judgment. That judgment may include making adjustments to determine look-through earnings, owner earnings, and intrinsic value, and to show the real costs of stock options or other obligations that GAAP does not require to be recorded on the financial statements.

Bringing this collection full circle, the concluding essays note the obvious but often overlooked tax advantages of long-term investment. Linking life's two certainties, the final essay includes one of Buffett's many jokes about his personal longevity: if enjoying life promotes longevity, he is jeopardizing Methuselah's record (969 years). At the symposium featuring this collection, someone asked what effect Buffett's death would have on Berkshire stock. Another answered, "a negative effect." Without missing a beat, Buffett quipped: "It won't be as negative for the holders as it will be for me."

The prominence of accounting discussions in Buffett's essays underscores that accounting policy and accounting decisions matter. That position is supported by Graham-Dodd fundamental valuation analysis. Yet it conflicts with modern finance theory's view that efficient markets will pierce accounting conventions to produce prices equal to values, and it also goes against the grain of what many MBA and JD students have been taught in the past few decades.

Buffett's essays can reeducate a generation of students, and continue the education of others. That is important because the gospel of modern finance theory that swept America in the past thirty years is still commonly preached. A lemming-like willingness to follow the crowd endures. Entailing the destruction of both leadership and independent thought, that weakness is the intellectual foe in the struggle Buffett's essays wage for intelligent and focused investing. While the battle remains to be won, this compendium is intended to aid in the quest.

PROLOGUE[1]

In some ways, our shareholder group is a rather unusual one, and this affects our manner of reporting to you. For example, at the end of each year about 98% of the shares outstanding are held by people who also were shareholders at the beginning of the year. Therefore, in our annual report we build upon what we have told you in previous years instead of restating a lot of material. You get more useful information this way, and we don't get bored.

Furthermore, perhaps 90% of our shares are owned by investors for whom Berkshire is their largest security holding, very often far and away the largest. Many of these owners are willing to spend a significant amount of time with the annual report, and we attempt to provide them with the same information we would find useful if the roles were reversed.

In contrast, we include no narrative with our quarterly reports. Our owners and managers both have very long time-horizons in regard to this business, and it is difficult to say anything new or meaningful each quarter about events of long-term significance.

But when you do receive a communication from us, it will come from the fellow you are paying to run the business. Your Chairman has a firm belief that owners are entitled to hear directly from the CEO as to what is going on and how he evaluates the business, currently and prospectively. You would demand that in a private company; you should expect no less in a public company. A once-a-year report of stewardship should not be turned over to a staff specialist or public relations consultant who is unlikely to be in a position to talk frankly on a manager-to-owner basis.

We feel that you, as owners, are entitled to the same sort of reporting by your managers as we feel is owed to us at Berkshire Hathaway by managers of our business units. Obviously, the degree of detail must be different, particularly where information would be useful to a business competitor or the like. But the general scope, balance, and level of candor should be similar. We don't expect a public relations document when our operating managers tell us what is going on, and we don't feel you should receive such a document.

In large part, companies obtain the shareholder constituency that they seek and deserve. If they focus their thinking and communications on short-term results or short-term stock market con-

---

1 [1979. Footnotes throughout indicate the year of the annual report from which essays are taken.]

sequences they will, in large part, attract shareholders who focus on the same factors. And if they are cynical in their treatment of investors, eventually that cynicism is highly likely to be returned by the investment community.

Phil Fisher, a respected investor and author, once likened the policies of the corporation in attracting shareholders to those of a restaurant attracting potential customers. A restaurant could seek a given clientele-patrons of fast foods, elegant dining, Oriental food, etc.-and eventually obtain an appropriate group of devotees. If the job were expertly done, that clientele, pleased with the service, menu, and price level offered, would return consistently. But the restaurant could not change its character constantly and end up with a happy and stable clientele. If the business vacillated between French cuisine and take-out chicken, the result would be a revolving door of confused and dissatisfied customers.

So it is with corporations and the shareholder constituency they seek. You can't be all things to all men, simultaneously seeking different owners whose primary interests run from high current yield to long-term capital growth to stock market pyrotechnics, etc.

The reasoning of managements that seek large trading activity in their shares puzzles us. In effect, such managements are saying that they want a good many of the existing clientele continually to desert them in favor of new ones-because you can't add lots of new owners (with new expectations) without losing lots of former owners.

We much prefer owners who like our service and menu and who return year after year. It would be hard to find a better group to sit in the Berkshire Hathaway shareholder "seats" than those already occupying them. So we hope to continue to have a very low turnover among our owners, reflecting a constituency that understands our operation, approves of our policies, and shares our expectations. And we hope to deliver on those expectations.

I. CORPORATE GOVERNANCE

Many annual meetings are a waste of time, both for shareholders and for management. Sometimes that is true because management is reluctant to open up on matters of business substance. More often a non-productive session is the fault of shareholder participants who are more concerned about their own moment on stage than they are about the affairs of the corporation. What should be a forum for business discussion becomes a forum for theatrics, spleen-venting and advocacy of issues. (The deal is irresistible: for the price of one share you get to tell a captive audience your ideas as to how the world should be run.) Under such circumstances, the quality of the meeting often deteriorates from year to year as the antics of those interested in themselves discourage attendance by those interested in the business.

Berkshire's meetings are a different story. The number of shareholders attending grows a bit each year and we have yet to experience a silly question or an ego-inspired commentary.2 Instead, we get a wide variety of thoughtful questions about the business. Because the annual meeting is the time and place for these, Charlie and I are happy to answer them all, no matter how long it takes. (We cannot, however, respond to written or phoned questions at other times of the year; one-person-at-a-time reporting is a poor use of management time in a company with 3,000 shareholders.)3 The only business matters that are off limits at the annual meeting are those about which candor might cost our company real money. Our activities in securities would be the main example.[4]

A. *Owner-Related Business Principles*[5]

1. *Although our form is corporate, our attitude is partnership. Charlie Munger and I think of our shareholders as owner-partners, and of ourselves as managing partners. (Because of the size of our shareholdings we are also, for better or worse, controlling partners.) We do not view the company itself as the ultimate owner of our business assets but instead view the company as a conduit through which our shareholders own the assets.*

---

2 [Subsequent letters sometimes report on the turnout at prior annual meetings. The turnout went from 12 at the 1975 meeting to approximately 7,500 at the 1997 meeting, with steady increases since 1984 averaging about 40% annually.]

3 [As of 1996, Berkshire Hathaway had 80,000 shareholders.]

4 [Two introductory paragraphs, 1984.]

5 [1996 Owner's Manual-originally 1983, and annually from 1988-96.]

Charlie and I hope that you do not think of yourself as merely owning a piece of paper whose price wiggles around daily and that is a candidate for sale when some economic or political event makes you nervous. We hope you instead visualize yourself as a part owner of a business that you expect to stay with indefinitely, much as you might if you owned a farm or apartment house in partnership with members of your family. For our part, we do not view Berkshire shareholders as faceless members of an ever-shifting crowd, but rather as co-venturers who have entrusted their funds to us for what may well turn out to be the remainder of their lives.

The evidence suggests that most Berkshire shareholders have indeed embraced this long-term partnership concept. The annual percentage turnover in Berkshire's shares is a small fraction of that occurring in the stocks of other major American corporations, even when the shares I own are excluded from the calculation.

In effect, our shareholders behave in respect to their Berkshire stock much as Berkshire itself behaves in respect to companies in which it has an investment. As owners of, say, Coca-Cola or Gillette shares, we think of Berkshire as being a non-managing partner in two extraordinary businesses, in which we measure our success by the long-term progress of the companies rather than by the month-to-month movements of their stocks. In fact, we would not care in the least if several years went by in which there was no trading, or quotation of prices, in the stocks of those companies. If we have good long-term expectations, short-term price changes are meaningless for us except to the extent they offer us an opportunity to increase our ownership at an attractive price.

2. In line with Berkshire's owner-orientation, most of our directors have a major portion of their net worth invested in the company. We eat our own cooking.

Charlie's family has 90% or more of its net worth in Berkshire shares; my wife, Susie, and I have more than 99%. In addition, many of my relatives-my sisters and cousins, for example-keep a huge portion of their net worth in Berkshire stock.

Charlie and I feel totally comfortable with this eggs-in-one-basket situation because Berkshire itself owns a wide variety of truly extraordinary businesses. Indeed, we believe that Berkshire is close to being unique in the quality and diversity of the businesses in which it owns either a controlling interest or a minority interest of significance.

Charlie and I cannot promise you results. But we can guarantee that your financial fortunes will move in lockstep with ours for whatever period of time you elect to be our partner. We have no interest in large salaries or options or other means of gaining an "edge" over you. We want to make money only when our partners do and in exactly the same proportion. Moreover, when I do something dumb, I want you to be able to derive some solace from the fact that my financial suffering is proportional to yours.

3. Our long-term economic goal (subject to some qualifications mentioned later) is to maximize Berkshire's average annual rate of gain in intrinsic business value on a per-share basis. We do not measure the economic significance or performance of Berkshire by its size; we measure by per-share progress. We are certain that the rate of per-share progress will diminish in the future-a greatly enlarged capital base will see to that. But we will be disappointed if our rate does not exceed that of the average large American corporation.

Since that was written at yearend 1983, our intrinsic value (a topic I'll discuss a bit later)6 has increased at an annual rate of about 25%, a pace that has definitely surprised both Charlie and me. Nevertheless the principle just stated remains valid: Operating with large amounts of capital as we do today, we cannot come close to performing as well as we once did with much smaller sums. The best rate of gain in intrinsic value we can even hope for is an average of 15% per annum, and we may well fall far short of that target. Indeed, we think very few large businesses have a chance of compounding intrinsic value at 15% per annum over an extended period of time. So it may be that we will end up meeting our stated goal-being above average-with gains that fall significantly short of 15%.

4. Our preference would be to reach our goal by directly owning a diversified group of businesses that generate cash and consistently earn above-average returns on capital. Our second choice is to own parts of similar businesses, attained primarily through purchases of marketable common stocks by our insurance subsidiaries. The price and availability of businesses and the need for insurance capital determine any given year's capital allocation.

As has usually been the case, it is easier today to buy small pieces of outstanding businesses via the stock market than to buy similar businesses in their entirety on a negotiated basis. Neverthe-

---

6 [*See* the essay Intrinsic Value, Book Value, and Market Price in Part V.E.]

less, we continue to prefer the 100% purchase, and in some years we get lucky: In 1995, in fact, we made three acquisitions. Though there will be dry years also, we expect to make a number of acquisitions in the decades to come, and our hope is that they will be large. If these purchases approach the quality of those we have made in the past, Berkshire will be well served.

The challenge for us is to generate ideas as rapidly as we generate cash. In this respect, a depressed stock market is likely to present us with significant advantages. For one thing, it tends to reduce the prices at which entire companies become available for purchase. Second, a depressed market makes it easier for our insurance companies to buy small pieces of wonderful businesses-including additional pieces of business we already own-at attractive prices. And third, some of those same wonderful businesses, such as Coca-Cola and Wells Fargo, are consistent buyers of their own shares, which means that they, and we, gain from the cheaper prices at which they can buy.

Overall, Berkshire and its long-term shareholders benefit from a sinking stock market much as a regular purchaser of food benefits from declining food prices. So when the market plummets-as it will from time to time-neither panic nor mourn. It's good news for Berkshire.

5. Because of our two-pronged approach to business ownership and because of the limitations of conventional accounting, consolidated reported earnings may reveal relatively little about our true economic performance. Charlie and I, *both as owners and managers, virtually ignore such consolidated numbers. However, we will also report to you the earnings of each major business we control, numbers we consider of great importance. These figures, along with other information we will supply about the individual businesses, should generally aid you in making judgments about them.*

To state things simply, we try to give you in the annual report the numbers and other information that really matter. Charlie and I pay a great deal of attention to how well our businesses are doing, and we also work to understand the environment in which each business is operating. For example, is one of our businesses enjoying an industry tailwind or is it facing a headwind? Charlie and I need to know exactly which situation prevails and to adjust our expectations accordingly. We will also pass along our conclusions to you.

Over time, practically all of our businesses have exceeded our expectations. But occasionally we have disappointments, and we

will try to be as candid in informing you about those as we are in describing the happier experiences. When we use unconventional measures to chart our progress . . . we will try to explain these concepts and why we regard them as important. In other words, we believe in telling you how we think so that you can evaluate not only Berkshire's businesses but also assess our approach to management and capital allocation.

6. Accounting consequences do not influence our operating or capital-allocation decisions. When acquisition costs are similar, we much prefer to purchase $2 *of earnings that is not reportable by us under standard accounting principles than to purchase* $1 *of earnings that is reportable. This is precisely the choice that often faces us since entire businesses (whose earnings will be fully reportable) frequently sell for double the pro-rata price of small portions (whose earnings will be largely unreportable). In aggregate and over time, we expect the unreported earnings to be fully reflected in our intrinsic business value through capital gains.*

We attempt to offset the shortcomings of conventional accounting by regularly reporting "look-through" earnings .... The look-through numbers include Berkshire's own reported operating earnings, excluding capital gains and purchase-accounting adjustments (an explanation of which occurs later in this message) plus Berkshire's share of the undistributed earnings of our major investees-amounts that are not included in Berkshire's figures under conventional accounting. From these undistributed earnings of our investees we subtract the tax we would have owed had the earnings been paid to us as dividends. We also exclude capital gains, purchase-accounting adjustments and extraordinary charges or credits from the investee numbers.

We have found over time that the undistributed earnings of our investees, in aggregate, have been as fully as beneficial to Berkshire asif they had been distributed to us (and therefore had been included in the earnings we officially report). This pleasant result has occurred because most of our investees are engaged in truly outstanding businesses that can often employ incremental capital to great advantage, either by putting it to work in their businesses or by repurchasing their shares. Obviously, every capital decision that our investees have made has not benefitted us as shareholders, but overall we have garnered far more than a dollar of value for each dollar they have retained. We consequently regard look-through earnings as realistically portraying our yearly gain from operations.

In 1992, our look-through earnings were $604 million, and in that same year we set a goal of raising them by an average of 15% per annum to $1.8 billion in the year 2000. Since that time, however, we have issued additional shares-including the B Shares sold recently-so that we now need look-through earnings of $1.9 billion in 2000 to match the per-share goal we originally were shooting for. This is a tough target but one we still hope to hit.

7. We use debt sparingly and, when we do borrow, we attempt to structure our loans on a long-term fixed-rate basis. We will reject interesting opportunities rather than over-leverage our balance sheet. This conservatism has penalized our results but it is the only behavior that leaves us comfortable, considering our fiduciary obligations to policyholders, lenders and the many equity holders who have committed unusually large portions of their net worth to our care. (As one of the Indianapolis "500" winners said: "To finish first, you must first finish.")

The financial calculus that Charlie and I employ would never permit our trading a good night's sleep for a shot at a few extra percentage points of return. I've never believed in risking what my family and friends have and need in order to pursue what they don't have and don't need.

Besides, Berkshire has access to two low-cost, non-perilous sources of leverage that allow us to safely own far more assets than our equity capital alone would permit: deferred taxes and "float," the funds of others that our insurance business holds because it receives premiums before needing to payout losses. Both of these funding sources have grown rapidly and now total about $12 billion.

Better yet, this funding to date has been cost-free. Deferred tax liabilities bear no interest. And as long as we can break even in our insurance underwriting-which we have done, on the average, during our 29 years in the business-the cost of the float developed from that operation is zero. Neither item, it should be understood, is equity; these are real liabilities. But they are liabilities without covenants or due dates attached to them. In effect, they give us the benefit of debt-an ability to have more assets working for us-but saddle us with none of its drawbacks.

Of course, there is no guarantee that we can obtain our float in the future at no cost. But we feel our chances of attaining that goal are as good as those of anyone in the insurance business. Not only have we reached the goal in the past (despite a number of important mistakes by your Chairman), but have now, with our acquisi-

tion of GEICO, materially improved our prospects for getting there in the future.

8. A managerial "wish list" will not be filled at shareholder expense. We will not diversify by purchasing entire businesses at control prices that ignore long-term economic consequences to our shareholders. We will only do with your money what we would do with our own, weighing fully the values you can obtain by diversifying your own portfolios through direct purchases in the stock market.

Charlie and I are interested only in acquisitions that we believe will raise the *per-share* intrinsic value of Berskhire's stock. The size of our paychecks or our offices will never be related to the size Berkshire's balance sheet.

9. We feel noble intentions should be checked periodically against results. We test the wisdom of retaining earnings by assessing whether retention, over time, delivers shareholders at least $1 *of market value for each* $1 *retained. To date, this test has been met. We will continue to apply it on a five-year rolling basis. As our net worth grows, it is more difficult to use retained earnings wisely.*

We continue to pass the test, but the challenges of doing so have grown more difficult. If we reach the point that we can't create extra value by retaining earnings, we will pay them out and let our shareholders deploy the funds.

10. We will issue common stock only when we receive as much in business value as we give. This rule applies to all forms of issuance-not only mergers or public stock offerings, but stock-for-debt swaps, stock options, and convertible securities as well. We will not sell small portions of your company-and that is what the issuance of shares amounts to-on a basis inconsistent with the value of the entire enterprise.

When we sold the Class B shares, we stated that Berkshire stock was not undervalued-and some people found that shocking. That reaction was not well-founded. Shock should have registered instead had we issued shares when our stock *was* undervalued. Managements that say or imply during a public offering that their stock is undervalued are usually being economical with the truth or uneconomical with their existing shareholders' money: Owners unfairly lose if their managers deliberately sell assets for 80¢ that in fact are worth $1. We didn't commit that kind of crime in our recent offering and we never will.

11. You should be fully aware of one attitude Charlie and I share that hurts our financial performance: Regardless of price, we

have no interest at all in selling any good businesses that Berkshire owns. We are also very reluctant to sell sub-par businesses as long as we expect them to generate at least some cash and as long as we feel good about their managers and labor relations. We hope not to repeat the capital-allocation mistakes that led us into such sub-par businesses. And we react with great caution to suggestions that our poor businesses can be restored to satisfactory profitability by major capital expenditures. (The projections will be dazzling and the advocates sincere, but, in the end, major additional investment in a terrible industry usually is about as rewarding as struggling in quicksand.) Nevertheless, gin rummy managerial behavior (discard your least promising business at each turn) is not our style. We would rather have our overall results penalized a bit than engage in that kind of behavior.

We continue to avoid gin rummy behavior. True, we closed our textile business in the mid-1980's after 20 years of struggling with it, but only because we felt it was doomed to run never-ending operating losses. We have not, however, given thought to selling operations that would command very fancy prices nor have we dumped our laggards, though we focus hard on curing the problems that cause them to lag.

12. We will be candid in our reporting to you, emphasizing the pluses and minuses important in appraising business value. Our guideline is to tell you the business facts that we would want to know if our positions were reversed. We owe you no less. Moreover, as a company with a major communications business, it would be inexcusable for us to apply lesser standards of accuracy, balance and incisiveness when reporting on ourselves than we would expect our news people to apply when reporting on others. We also believe candor benefits us as managers: The CEO who misleads others in public may eventually mislead himself in private.

At Berkshire you will find no "big bath" accounting maneuvers or restructuring. And we won't "smooth" quarterly or annual results: If earnings figures are lumpy when they reach headquarters, they will be lumpy when they reach you. Finally, when the numbers are a very rough "guesstimate," as they necessarily must be in insurance reserving, we will try to be both consistent and conservative in our approach.

We will be communicating with you in several ways. Through the annual report, I try to give all shareholders as much value-defining information as can be conveyed in a document kept to reasonable length. We also try to convey a liberal quantity of

condensed but important information in our quarterly reports, though I don't write those (one recital a year is enough). Still another important occasion for communication is our Annual Meeting, at which Charlie and I are delighted to spend five hours or more answering questions about Berkshire. But there is one way we *can't* communicate: on a one-on-one basis. That isn't feasible given Berkshire's many thousands of owners.

In all of our communications, we try to make sure that no single shareholder gets an edge: We do not follow the usual practice of giving earnings "guidance" to analysts or large shareholders. Our goal is to have all of our owners updated at the same time.

13. Despite our policy of candor we will discuss our activities in marketable securities only to the extent legally required. Good investment ideas are rare, valuable and subject to competitive appropriation just as good product or business acquisition ideas are. Therefore we normally will not talk about our investment ideas. This ban extends even to securities we have sold (because we may purchase them again) and to stocks we are incorrectly rumored to be buying. If we deny those reports but say "no comment" on other occasions, the no-comments become confirmation.

Though we continue to be unwilling to talk about specific stocks, we freely discuss our business and investment philosophy. I benefitted enormously from the intellectual generosity of Ben Graham, the greatest teacher in the history of finance, and I believe it appropriate to pass along what I learned from him, even if that creates new and able investment competitors for Berkshire just as Ben's teachings did for him.

AN ADDED PRINCIPLE

To the extent possible, we would like each Berkshire shareholder to record a gain or loss in market value during his period of ownership that is proportional to the gain or loss in per-share intrinsic value recorded by the company during that holding period. For this to come about, the relationship between the intrinsic value and the market price of a Berkshire share would need to remain constant, and by our preferences at I-to-l. As that implies, we would rather see Berkshire's stock price at a **fair** level than a **high** level. Obviously, Charlie and I can't control Berkshire's price. But by our policies and communications, we can encourage informed, rational behavior by owners that, in turn, will tend to produce a stock price that is also rational. Our it's-as-bad-to-be-overvalued-as-to-be-undervalued approach may disappoint some shareholders, par-

ticularly those poised to sell. We believe, however, that it affords Berkshire the best prospect of attracting long-term investors who seek to profit from the progress of the company rather than from the investment mistakes of their partners.

B. *Boards and Managers*[7]

[The performance of CEOs of investee companies], which we have observed at close range, contrasts vividly with that of many CEOs, which we have fortunately observed from a safe distance. Sometimes these CEOs clearly do not belong in their jobs; their positions, nevertheless, are usually secure. The supreme irony of business management in that it is far easier for an inadequate CEO to keep his job than it is for an inadequate subordinate.

If a secretary, say, is hired for a job that requires typing ability of at least 80 words a minute and turns out to be capable of only 50 words a minute, she will lose her job in no time. There is a logical standard for this job; performance is easily measured; and if you can't make the grade, you're out. Similarly, if new sales people fail to generate sufficient business quickly enough, they will be let go. Excuses will not be accepted as a substitute for orders.

However, a CEO who doesn't perform is frequently carried indefinitely. One reason is that performance standards for his job seldom exist. When they do, they are often fuzzy or they may be waived or explained away, even when the performance shortfalls are major and repeated. At too many companies, the boss shoots the arrow of managerial performance and then hastily paints the bullseye around the spot where it lands.

Another important, but seldom recognized, distinction between the boss and the foot soldier is that the CEO has no immediate superior whose performance is itself getting measured. The sales manager who retains a bunch of lemons in his sales force will soon be in hot water himself. It is in his immediate self-interest to promptly weed out his hiring mistakes. Otherwise, he himself may be weeded out. An office manager who has hired inept secretaries faces the same imperative.

But the CEO's boss is a Board of Directors that seldom measures itself and is infrequently held to account for substandard corporate performance. If the Board makes a mistake in hiring, and perpetuates that mistake, so what? Even if the company is taken over because of the mistake, the deal will probably bestow substan-

---

7 [Divided by hash lines: 1988; 1993; 1986.]

tial benefits on the outgoing Board members. (The bigger they are, the softer they fall.)

Finally, relations between the Board and the CEO are expected to be congenial. At board meetings, criticism of the CEO's performance is often viewed as the social equivalent of belching. No such inhibitions restrain the office manager from critically evaluating the substandard typist.

These points should not be interpreted as a blanket condemnation of CEOs or Boards of Directors: Most are able and hard-working, and a number are truly outstanding. But the management failings that Charlie and I have seen make us thankful that we are linked with the managers of our three permanent holdings. They love their businesses, they think like owners, and they exude integrity and ability.

At our annual meetings, someone usually asks "What happens to this place if you get hit by a truck?" I'm glad they are still asking the question in this form. It won't be too long before the query becomes: "What happens to this place if you *don't* get hit by a truck?"

Such questions, in any event, raise a reason for me to discuss corporate governance, a hot topic during the past year. In general, I believe that directors have stiffened their spines recently and that shareholders are now being treated somewhat more like true owners than was the case not long ago. Commentators on corporate governance, however, seldom make any distinction among three fundamentally different manager/owner situations that exist in publicly-held companies. Though the legal responsibility of directors is identical throughout, their ability to effect change differs in each of the cases. Attention usually falls on the first case, because it prevails on the corporate scene. Since Berkshire falls into the second category, however, and will someday fall into the third, we will discuss all three variations.

The first, and by far most common, board situation is one in which a corporation has no controlling shareholder. **In** that case, I believe directors should behave as if there is a single absentee owner, whose long-term interest they should try to further in all proper ways. Unfortunately, "long-term" gives directors a lot of wiggle room. **If** they lack either integrity or the ability to think independently, directors can do great violence to shareholders while still claiming to be acting in their long-term interest. But assume the board is functioning well and must deal with a manage-

ment that is mediocre or worse. Directors then have the responsibility for changing that management, just as an intelligent owner would do if he were present. And if able but greedy managers over-reach and try to dip too deeply into the shareholders' pockets, directors must slap their hands.

In this plain-vanilla case, a director who sees something he doesn't like should attempt to persuade the other directors of his view. If he is successful, the board will have the muscle to make the appropriate change. Suppose, though, that the unhappy director can't get other directors to agree with him. He should then feel free to make his views known to the absentee owners. Directors seldom do that, of course. The temperament of many directors would in fact be incompatible with critical behavior of that sort. But I see nothing improper in such actions, assuming the issues are serious. Naturally, the complaining director can expect a vigorous rebuttal from the unpersuaded directors, a prospect that should discourage the dissenter from pursuing trivial or non-rational causes.

For the boards just discussed, I believe the directors ought to be relatively few in number-say, ten or less-and ought to come mostly from the outside. The outside board members should establish standards for the CEO's performance and should also periodically meet, without his being present, to evaluate his performance against those standards.

The requisites for board membership should be business savvy, interest in the job, and owner-orientation. Too often, directors are selected simply because they are prominent or add diversity to the board. That practice is a mistake. Furthermore, mistakes in selecting directors are particularly serious because appointments are so hard to undo: The pleasant but vacuous director need never worry about job security.

The second case is that existing at Berkshire, where the controlling owner is also the manager. At some companies, this arrangement is facilitated by the existence of two classes of stock endowed with disproportionate voting power. In these situations, it's obvious that the board does not act as an agent between owners and management and that the directors cannot effect change except through persuasion. Therefore, if the owner/manager is mediocre or worse-or is over-reaching-there is little a director can do about it except object. If the directors having no connections to the owner/manager make a unified argument, it may well have some effect. More likely it will not.

If change does not come, and the matter is sufficiently serious, the outside directors should resign. Their resignation will signal their doubts about management, and it will emphasize that no outsider is in a position to correct the owner/manager's shortcomings.

The third governance case occurs when there is a controlling owner who is not involved in management. This case, examples of which are Hershey Foods and Dow Jones, puts the outside directors in a potentially useful position. If they become unhappy with either the competence or integrity of the manager, they can go directly to the owner (who may also be on the board) and report their dissatisfaction. This situation is ideal for an outside director, since he need make his case only to a single, presumably interested owner, who can forthwith effect change if the argument is persuasive. Even so, the dissatisfied director has only that single course of action. If he remains unsatisfied about a critical matter, he has no choice but to resign.

Logically, the third case should be the most effective in insuring first-class management. In the second case the owner is not going to fire himself, and in the first case, directors often find it very difficult to deal with mediocrity or mild over-reaching. Unless the unhappy directors can win over a majority of the board-an awkward social and logistical task, particularly if management's behavior is merely odious, not egregious-their hands are effectively tied. In practice, directors trapped in situations of this kind usually convince themselves that by staying around they can do at least some good. Meanwhile, management proceeds unfettered.

In the third case, the owner is neither judging himself nor burdened with the problem of garnering a majority. He can also insure that outside directors are selected who will bring useful qualities to the board. These directors, in turn, will know that the good advice they give will reach the right ears, rather than being stifled by a recalcitrant management. If the controlling owner is intelligent and self-confident, he will make decisions in respect to management that are meritocratic and pro-shareholder. Moreover-and this is critically important-he can readily correct any mistake he makes.

At Berkshire we operate in the second mode now and will for as long as I remain functional. My health, let me add, is excellent. For better or worse, you are likely to have me as an owner/manager for some time.

After my death, all of my stock will go to my wife, Susie, should she survive me, or to a foundation if she dies before I do. In

neither case will taxes and bequests require the sale of consequential amounts of stock.

When my stock is transferred to either my wife or the foundation, Berkshire will enter the third governance mode, going forward with a vitally interested, but non-management, owner and with a management that must perform for that owner. In preparation for that time, Susie was elected to the board a few years ago, and in 1993 our son, Howard, joined the board. These family members will not be managers of the company in the future, but they will represent the controlling interest should anything happen to me. Most of our other directors are also significant owners of Berkshire stock, and each has a strong owner-orientation. All in all, we're prepared for "the truck."

Charlie Munger, our Vice Chairman, and I really have only two jobs. One is to attract and keep outstanding managers to run our various operations.[8] This hasn't been all that difficult. Usually the managers came with the companies we bought, having demonstrated their talents throughout careers that spanned a wide variety of business circumstances. They were managerial stars long before they knew us, and our main contribution has been to not get in their way. This approach seems elementary: if my job were to manage a golf team-and if Jack Nicklaus or Arnold Palmer were willing to play for me-neither would get a lot of directives from me about how to swing.

Some of our key managers are independently wealthy (we hope they all become so), but that poses no threat to their continued interest: they work because they love what they do and relish the thrill of outstanding performance. They unfailingly think like owners (the highest compliment we can pay a manager) and find all aspects of their business absorbing.

(Our prototype for occupational fervor is the Catholic tailor who used his small savings of many years to finance a pilgrimage to the Vatican. When he returned, his parish held a special meeting to get his first-hand account of the Pope. "Tell us," said the eager faithful, "just what sort of fellow is he?" Our hero wasted no words: "He's a forty-four medium.")

Charlie and I know that the right players will make almost any team manager look good. We subscribe to the philosophy of Ogilvy & Mather's founding genius, David Ogilvy: "If each of us

---

8 [The other is capital allocation, discussed in Parts II and V.]

hires people who are smaller than we are, we shall become a company of dwarfs. But, if each of us hires people who are bigger than we are, we shall become a company of giants."

A by-product of our managerial style is the ability it gives us to easily expand Berkshire's activities. We've read management treatises that specify exactly how many people should report to any one executive, but they make little sense to us. When you have able managers of high character running businesses about which they are passionate, you can have a dozen or more reporting to you and still have time for an afternoon nap. Conversely, if you have even one person reporting to you who is deceitful, inept or uninterested, you will find yourself with more than you can handle. Charlie and I could work with double the number of managers we now have, so long as they had the rare qualities of the present ones.

We intend to continue our practice of working only with people whom we like and admire. This policy not only maximizes our chances for good results, it also ensures us an extraordinarily good time. On the other hand, working with people who cause your stomach to churn seems much like marrying for money-probably a bad idea under any circumstances, but absolute madness if you are already rich.

C. *The Anxieties of Plant Closings*[9]

In July we decided to close our textile operation, and by yearend this unpleasant job was largely completed. The history of this business is instructive.

When Buffett Partnership, Ltd., an investment partnership of which I was general partner, bought control of Berkshire Hathaway 21 years ago, it had an accounting net worth of $22 million, all devoted to the textile business. The company's intrinsic business value, however, was considerably less because the textile assets were unable to earn returns commensurate with their accounting value. Indeed, during the previous nine years (the period in which Berkshire and Hathaway operated as a merged company) aggregate sales of $530 million had produced an aggregate loss of $10 million. Profits had been reported from time to time but the net effect was always one step forward, two steps back.

At the time we made our purchase, southern textile plants-largely non-union-were believed to have an important competi-

9 [1985.]

tive advantage. Most northern textile operations had closed and many people thought we would liquidate our business as well.

We felt, however, that the business would be run much better by a long-time employee whom we immediately selected to be president, Ken Chace. In this respect we were 100% correct: Ken and his recent successor, Garry Morrison, have been excellent managers, every bit the equal of managers at our more profitable businesses.

In early 1967 cash generated by the textile operation was used to fund our entry into insurance via the purchase of National Indemnity Company. Some of the money came from earnings and some from reduced investment in textile inventories, receivables, and fixed assets. This pullback proved wise: although much improved by Ken's management, the textile business never became a good earner, not even in cyclical upturns.

Further diversification for Berkshire followed, and gradually the textile operation's depressing effect on our overall return diminished as the business became a progressively smaller portion of the corporation. We remained in the business for reasons that I stated in the 1978 annual report (and summarized at other times also): "(1) our textile businesses are very important employers in their communities, (2) management has been straightforward in reporting on problems and energetic in attacking them, (3) labor has been cooperative and understanding in facing our common problems, and (4) the business should average modest cash returns relative to investment." I further said, "As long as these conditions prevail-and we expect that they will-we intend to continue to support our textile business despite more attractive alternative uses for capital."

It turned out that I was very wrong about (4). Though 1979 was moderately profitable, the business thereafter consumed major amounts of cash. By mid-1985 it became clear, even to me, that this condition was almost sure to continue. Could we have found a buyer who would continue operations, I would have certainly preferred to sell the business rather than liquidate it, even if that meant somewhat lower proceeds for us. But the economics that were finally obvious to me were also obvious to others, and interest was nil.

I won't close down businesses of sub-normal profitability merely to add a fraction of a point to our corporate rate of return. However, I also feel it inappropriate for even an exceptionally profitable company to fund an operation once it appears to have

unending losses in prospect. Adam Smith would disagree with my first proposition, and Karl Marx would disagree with my second; the middle ground is the only position that leaves me comfortable.

I should reemphasize that Ken and Garry have been resourceful, energetic and imaginative in attempting to make our textile operation a success. Trying to achieve sustainable profitability, they reworked product lines, machinery configurations and distribution arrangements. We also made a major acquisition, Waumbec Mills, with the expectation of important synergy (a term widely used in business to explain an acquisition that otherwise makes no sense). But in the end nothing worked and I should be faulted for not quitting sooner. A recent *Business Week* article stated that 250 textile mills have closed since 1980. Their owners were not privy to any information that was unknown to me; they simply processed it more objectively. I ignored Comte's advice-"the intellect should be the servant of the heart, but not its slave"-and believed what I preferred to believe.

The domestic textile industry operates in a commodity business, competing in a world market in which substantial excess capacity exists. Much of the trouble we experienced was attributable, both directly and indirectly, to competition from foreign countries whose workers are paid a small fraction of the U.S. minimum wage. But that in no way means that our labor force deserves any blame for our closing. In fact, in comparison with employees of American industry generally, our workers were poorly paid, as has been the case throughout the textile business. In contract negotiations, union leaders and members were sensitive to our disadvantageous cost position and did not push for unrealistic wage increases or unproductive work practices. To the contrary, they tried just as hard as we did to keep us competitive. Even during our liquidation period they performed superbly. (Ironically, we would have been better off financially if our union had behaved unreasonably some years ago; we then would have recognized the impossible future that we faced, promptly closed down, and avoided significant future losses.)

Over the years, we had the option of making large capital expenditures in the textile operation that would have allowed us to somewhat reduce variable costs. Each proposal to do so looked like an immediate winner. Measured by standard return-on-investment tests, in fact, these proposals usually promised greater economic benefits than would have resulted from comparable

expenditures in our highly-profitable candy and newspaper businesses.

But the promised benefits from these textile investments were illusory. Many of our competitors, both domestic and foreign, were stepping up to the same kind of expenditures and, once enough companies did so, their reduced costs became the baseline for reduced prices industrywide. Viewed individually, each company's capital investment decision appeared cost-effective and rational; viewed collectively, the decisions neutralized each other and were irrational Gust as happens when each person watching a parade decides he can see a little better if he stands on tiptoes). After each round of investment, all the players had more money in the game and returns remained anemic.

Thus, we faced a miserable choice: huge capital investment would have helped to keep our textile business alive, but would have left us with terrible returns on ever-growing amounts of capital. After the investment, moreover, the foreign competition would still have retained a major, continuing advantage in labor costs. A refusal to invest, however, would make us increasingly non-competitive, even measured against domestic textile manufacturers. I always thought myself in the position described by Woody Allen in one of his movies: "More than any other time in history, mankind faces a crossroads. One path leads to despair and utter hopelessness, the other to total extinction. Let us pray we have the wisdom to choose correctly."

For an understanding of how the to-invest-or-not-to-invest dilemma plays out in a commodity business, it is instructive to look at Burlington Industries, by far the largest U.S. textile company both 21 years ago and now. In 1964 Burlington had sales of $1.2 billion against our $50 million. It had strengths in both distribution and production that we could never hope to match and also, of course, had an earnings record far superior to ours. Its stock sold at 60 at the end of 1964; ours was 13.

Burlington made a decision to stick to the textile business, and in 1985 had sales of about $2.8 billion. During the 1964-85 period, the company made capital expenditures of about $3 billion, far more than any other U.S. textile company and more than $200-per-share on that $60 stock. A very large part of the expenditures, I am sure, was devoted to cost improvement and expansion. Given Burlington's basic commitment to stay in textiles, I would also surmise that the company's capital decisions were quite rational.

Nevertheless, Burlington has lost sales volume in real dollars and has far lower returns on sales and equity now than 20 years ago. Split 2-for-1 in 1965, the stock now sells at 34-on an adjusted basis, just a little over its $60 price in 1964. Meanwhile, the CPI has more than tripled. Therefore, each share commands about one-third the purchasing power it did at the end of 1964. Regular dividends have been paid but they, too, have shrunk significantly in purchasing power.

This devastating outcome for the shareholders indicates what can happen when much brain power and energy are applied to a faulty premise. The situation is suggestive of Samuel Johnson's horse: "A horse that can count to ten is a remarkable horse-not a remarkable mathematician." Likewise, a textile company that allocates capital brilliantly within its industry is a remarkable textile company-but not a remarkable business.

My conclusion from my own experiences and from much observation of other businesses is that a good managerial record (measured by economic returns) is far more a function of what business boat you get into than it is of how effectively you row (though intelligence and effort help considerably, of course, in any business, good or bad). Some years ago I wrote: "When a management with a reputation for brilliance tackles a business with a reputation for poor fundamental economics, it is the reputation of the business that remains intact." Nothing has since changed my point of view on that matter. Should you find yourself in a chronically-leaking boat, energy devoted to changing vessels is likely to be more productive than energy devoted to patching leaks.

D. *An Owner-Based Approach to Corporate Charity*[10]

A recent survey reported that about 50% of major American companies match charitable contributions made by directors (sometimes by a factor of three to one). In effect, these representatives of the owners direct funds to their favorite charities, and never consult the owners as to their charitable preferences. (I wonder how they would feel if the process were reversed and shareholders could invade the directors' pockets for charities favored by the shareholders.) When A takes money from B to give to C and A is a legislator, the process is called taxation. But when A is an officer or director of a corporation, it is called philanthropy. We continue to believe that contributions, aside from those with quite

10 [Divided by hash lines: 1987; 1981 (reprinted 1988); 1981; 1990-93; 1993.]

clear direct benefits to the company, should reflect the charitable preferences of owners rather than those of officers and directors.

On September 30, 1981 Berkshire received a tax ruling from the U.S. Treasury Department that, in most years, should produce a significant benefit for charities of your choice.

Each Berkshire shareholder-on a basis proportional to the number of shares of Berkshire that he owns-will be able to designate recipients of charitable contributions by our company. You'll name the charity; Berkshire will write the check. The ruling states that there will be no personal tax consequences to our shareholders from making such designations.

Thus, our . . . owners now can exercise a perquisite that, although routinely exercised by the owners in closely-held businesses, is almost exclusively exercised by the managers in more widely-held businesses.

In a widely-held corporation the executives ordinarily arrange all charitable donations, with no input at all from shareholders, in two main categories:

(1) Donations considered to benefit the corporation directly in an amount roughly commensurate with the cost of the donation; and

(2) Donations considered to benefit the corporation indirectly through hard-to-measure, long-delayed feedback effects of various kinds.

I and other Berkshire executives have arranged in the past, as we will arrange in the future, all charitable donations in the first category. However, the aggregate level of giving in such category has been quite low, and very likely will remain quite low, because not many gifts can be shown to produce roughly commensurate direct benefits to Berkshire.

In the second category, Berkshire's charitable gifts have been virtually nil, because I am not comfortable with ordinary corporate practice and had no better practice to substitute. What bothers me about ordinary corporate practice is the way gifts tend to be made based more on who does the asking and how corporate peers are responding than on an objective evaluation of the donee's activities. Conventionality often overpowers rationality.

A common result is the use of the stockholder's money to implement the charitable inclinations of the corporate manager, who usually is heavily influenced by specific social pressures on him. Frequently there is an added incongruity; many corporate manag-

ers deplore governmental allocation of the taxpayer's dollar but embrace enthusiastically their own allocation of the shareholder's dollar.

For Berkshire, a different model seems appropriate. Just as I wouldn't want you to implement your personal judgments by writing checks on my bank account for charities of your choice, I feel it inappropriate to write checks on your corporate "bank account" for charities of my choice. Your charitable preferences are as good as mine and, for both you and me, funds available to foster charitable interests in a tax-deductible manner reside largely at the corporate level rather than in our own hands.

Under such circumstances, I believe Berkshire should imitate more closely-held companies, not larger public companies. If you and I each own 50% of a corporation, our charitable decision making would be simple. Charities very directly related to the operations of the business would have first claim on our available charitable funds. Any balance available after the "operations-related" contributions would be divided among various charitable interests of the two of us, on a basis roughly proportional to our ownership interest. If the manager of our company had some suggestions, we would listen carefully-but the final decision would be ours. Despite our corporate form, in this aspect of the business we probably would behave as if we were a partnership.

Wherever feasible, I believe in maintaining such a partnership frame of mind, even though we operate through a large, fairly widely-held corporation. Our Treasury ruling will allow such partnership-like behavior in this area [...]

I am pleased that Berkshire donations can become owner-directed. It is ironic, but understandable, that a large and growing number of major corporations have charitable policies pursuant to which they will match gifts made by their employees (and-brace yourself for this one-many even match gifts made by directors) but none, to my knowledge, has a plan matching charitable gifts by owners. I say "understandable" because much of the stock of many large corporations is owned on a "revolving door" basis by institutions that have short-term investment horizons, and that lack a long-term owner's perspective [...]

Our own shareholders are a different breed .... [A]t the end of each year, more than 98% of our shares are owned by people who were shareholders at the beginning of the year. This long-term commitment to the business reflects an owner mentality which, as your manager, I intend to acknowledge in all feasible

ways. The designated contributions policy is an example of that intent.

Our new program enabling shareholders to designate the recipients of corporate charitable contributions was greeted with extraordinary enthusiasm. . .. Of 932,206 shares eligible for participation (shares where the name of the actual owner appeared on our stockholder record), 95.6% responded. Even excluding Buffett-related shares, the response topped 90%.

In addition, more than 3% of our shareholders voluntarily wrote letters or notes, all but one approving of the program. Both the level of participation and of commentary surpass any shareholder response we have witnessed, even when such response has been intensively solicited by corporate staff and highly-paid professional proxy organizations. In contrast, your extraordinary level of response occurred without even the nudge of a company-provided return envelope. This self-propelled behavior speaks well for the program, and speaks well for our shareholders.

Apparently the owners of our corporation like both possessing and exercising the ability to determine where gifts of their funds shall be made. The "father-knows-best" school of corporate governance will be surprised to find that none of our shareholders sent in a designation sheet with instructions that the officers of Berkshire-in their superior wisdom, of course-make the decision on charitable funds applicable to his shares. Nor did anyone suggest that his share of our charitable funds be used to match contributions made by our corporate directors to charities of the directors' choice (a popular, proliferating and non-publicized policy at many large corporations).

All told, $1,783,655 of shareholder-designed contributions were distributed to about 675 charities. In addition, Berkshire and subsidiaries continue to make certain contributions pursuant to local level decisions made by our operating managers.

There will be some years, perhaps two or three out of ten, when contributions by Berkshire will produce substandard tax deductions-or none at all. In those years we will not effect our shareholder-designated charitable program. In all other years we expect to inform you about October 10th of the amount per share that you may designate. A reply form will accompany the notice, and you will be given about three weeks to respond with your designation. . . .

Our only disappointment with this program in 1981 was that some of our shareholders, through no fault of their own, missed the opportunity to participate. The Treasury Department ruling allowing us to proceed without tax uncertainty was received early in October. The ruling did not cover participation by shareholders whose stock was registered in the name of nominees, such as brokers, and additionally required that the owners of all designating shares make certain assurances to Berkshire. These assurances could not be given us in effective form by nominee holders.

Under these circumstances, we attempted to communicate with all of our owners promptly (via [an] October 14th letter) so that, if they wished, they could prepare themselves to participate by the November 13th record date. It was particularly important that this information be communicated promptly to stockholders whose holdings were in nominee name, since they would not be eligible unless they took action to re-register their shares before the record date.

Unfortunately, communication to such non-record shareholders could take place only through the nominees. We therefore strongly urged those nominees, mostly brokerage houses, to promptly transmit our letter to the real owners. We explained that their failure to do so could deprive such owners of an important benefit.

The results from our urging would not strengthen the case for private ownership of the U.S. Postal Service. Many of our shareholders never heard from their brokers (as some shareholders told us after reading news accounts of the program). Others were forwarded our letter too late for action.

One of the largest brokerage houses claiming to hold stock for sixty of its clients (about 4% of our shareholder population), apparently transmitted our letter about three weeks after receipt-too late for any of the sixty of participate. (Such lassitude did not pervade all departments of that firm; it billed Berkshire for mailing services within six days of that belated and ineffectual action.)

We recite such horror stories for two reasons: (1) if you wish to participate in future designated-contribution programs, be sure to have your stock registered in your name well before September 30th; and (2) even if you don't care to participate and prefer to leave your stock in nominee form, it would be wise to have at least one share registered in your own name. By so doing, you can be sure that you will be notified of any important corporate news at the same time as all other shareholders.

The designated-contributions idea, along with many other ideas that have turned out well for us, was conceived by Charlie Munger, Vice Chairman of Berkshire and Chairman of Blue Chip. Irrespective of titles, Charlie and I work as partners in managing all controlled companies. To almost a sinful degree, we enjoy our work as managing partners. And we enjoy having you as our financial partners.

In addition to the shareholder-designated contributions that Berkshire distributes, managers of our operating businesses make contributions, including merchandise, averaging [between $1.5 million and $2.5 million] annually. These contributions support local charities, such as The United Way, and produce roughly commensurate benefits for our businesses.

However, neither our operating managers nor officers of the parent company use Berkshire funds to make contributions to broad national programs or charitable activities of special personal interest to them, except to the extent they do so as shareholders. If your employees, including your CEO, wish to give to their alma maters or other institutions to which they feel a personal attachment, we believe they should use their own money, not yours.

Berkshire's practice in respect to discretionary philanthropy-as contrasted to its policies regarding contributions that are clearly related to the company's business activities-differs significantly from that of other publicly-held corporations. There, most corporate contributions are made pursuant to the wishes of the CEO (who often will be responding to social pressures), employees (through matching gifts), or directors (through matching gifts or requests they make of the CEO).

At Berkshire, we believe that the company's money is the owners' money, just as it would be in a closely-held corporation, partnership, or sole proprietorship. Therefore, if funds are to be given to causes unrelated to Berkshire's business activities, it is the charities favored by our owners that should receive them. We've yet to find a CEO who believes he should personally fund the charities favored by his shareholders. Why, then, should they foot the bill for his picks?

Let me add that our program is easy to administer. Last fall, for two months, we borrowed one person from National Indemnity to help us implement the instructions that came from our 7,500 registered shareholders. I'd guess that the average corporate program

in which employee gifts are matched incurs far greater administrative costs. Indeed, our entire corporate overhead is less than half the size of our charitable contributions. (Charlie, however, insists that I tell you that $1.4 million of our $4.9 million overhead is attributable to our corporate jet, The Indefensible.)11

Below is a list showing the largest categories to which our shareholders have steered their contributions.

(a) 347 churches and synagogues received 569 gifts

(b) 238 colleges and universities received 670 gifts

(c) 244 K-12 schools (about two-thirds secular, one-third religious) received 525 gifts

(d) 288 institutions dedicated to art, culture or the humanities received 447 gifts

(e) 180 religious social-service organizations (split about equally between Christian and Jewish) received 411 gifts

---

11 [Typesetting in original] [The 1986 letter contained the following:}

We bought a corporate jet last year. [Typesetting in original] What you have heard about such planes is true: they are very expensive and a luxury in situations like ours where little travel to out-of-the-way places is required. And planes not only cost a lot to operate, they cost a lot just to look at. Pre-tax, cost of capital plus depreciation on a new $15 million plane probably runs $3 million annually. On our own plane, bought for $850,000 used, such costs run close to $200,000 annually.

Cognizant of such figures, your Chairman, unfortunately, has in the past made a number of rather intemperate remarks about corporate jets. Accordingly, prior to our purchase, I was forced into my Galileo mode. I promptly experienced the necessary "counter-revelation" and travel is now considerably easier-and considerably costlier-than in the past. Whether Berkshire will get its money's worth from the plane is an open question, but I will work at achieving some business triumph that I can (no matter how dubiously) attribute to it. I'm afraid Ben Franklin had my number. Said he: "So convenient a thing it is to be a reasonable creature, since it enables one to find or make a reason for everything one has a mind to do."

[The 1989 letter contained the following:]

Last summer we sold the corporate jet that we purchased for $850,000 three years ago and bought another used jet for $6.7 million. [Noting an amusing anecdote of Carl Sagan about obstacles that impede exponential growth of bacteria-referred to in the Epilogue below, some readers] wiJI understandably panic: If our net worth continues to increase at current rates, and the cost of replacing planes also continues to rise at the now-established rate of 100% compounded annually, it will not be long before Berkshire's entire net worth is consumed by its jet.

Charlie doesn't like it when I equate the jet with bacteria; he feels it's degrading to the bacteria. His idea of traveling in style is an air-conditioned bus, a luxury he steps up to only when bargain fairs are in effect. My own attitude toward the jet can be summarized by the prayer attributed, apocryphally I'm sure, to St. Augustine as he contemplated leaving a life of secular pleasures to become a priest. Battling the conflict between intellect and glands, he pled: "Help me, Oh Lord, to become chaste-but not yet."

Naming the plane has not been easy. I initially suggested "The Charles T. Munger." Charlie countered with "The Aberration." We finally settled on "The Indefensible."

(f) 445 secular social-service organizations (about 40% youth-related) received 759 gifts
(g) 153 hospitals received 261 gifts
(h) 186 health-related organizations (American Heart Association, American Cancer Society, etc.) received 320 gifts

Three things about this list seem particularly interesting to me. First, to some degree it indicates what people choose to give money to when they are acting of their own accord, free of pressure from solicitors or emotional appeals from charities. Second, the contributions programs of publicly-held companies almost never allow gifts to churches and synagogues, yet clearly these institutions are what many shareholders would like to support. Third, the gifts made by our shareholders display conflicting philosophies: 130 gifts were directed to organizations that believe in making abortions readily available for women and 30 gifts were directed to organizations (other than churches) that discourage or are opposed to abortion.

Last year I told you that I was thinking of raising the amount that Berkshire shareholders can give under our designated-contributions program and asked for your comments. We received a few well-written letters opposing the entire idea, on the grounds that it was our job to run the business and not our job to force shareholders into making charitable gifts. Most of the shareholders responding, however, noted the tax efficiency of the plan and urged us to increase the designated amount. Several shareholders who have given stock to their children or grandchildren told me that they consider the program a particularly good way to get youngsters thinking at an early age about the subject of giving. These people, in other words, perceive the program to be an educational, as well as philanthropic, tool. The bottom line is that we did raise the amount in 1993, from $8 per share to $10.[12]

E. *A Principled Approach to Executive Pay*[13]

When returns on capital are ordinary, an earn-more-by-putting-up-more record is no great managerial achievement. You can

---

12 [Each annual letter states the approximate percentage of eligible shares that participated in the shareholder-designated contributions program, the dollar amount of the contributions, and the number of recipients. Since 1988, the percentage of shares has always exceeded 95% and has averaged about 97%; the dollar amount has risen steadily from $5 million in 1988 to $13.3 million in 1996, averaging about $8.4 million annually during that period; and the number of charities has also risen steadily from 2,319 in 1988 to 3,910 in 1996, averaging about 3,000 annually during that period.]

13 [Divided by hash lines: 1985; 1994; 1991.]

get the same result personally while operating from your rocking chair. Just quadruple the capital you commit to a savings account and you will quadruple your earnings. You would hardly expect hosannas for that particular accomplishment. Yet, retirement announcements regularly sing the praises of CEOs who have, say, quadrupled earnings of their widget company during their reign-with no one examining whether this gain was attributable simply to many years of retained earnings and the workings of compound interest.

If the widget company consistently earned a superior return on capital throughout the period, or if capital employed only doubled during the CEO's reign, the praise for him may be well deserved. But if return on capital was lackluster and capital employed increased in pace with earnings, applause should be withheld. A savings account in which interest was reinvested would achieve the same year-by-year increase in earnings-and, at only 8% interest, would quadruple its annual earnings in 18 years.

The power of this simple math is often ignored by companies to the detriment of their shareholders. Many corporate compensation plans reward managers handsomely for earnings increases produced solely, or in large part, by retained earnings-i.e., earnings withheld from owners. For example, ten-year, fixed-price stock options are granted routinely, often by companies whose dividends are only a small percentage of earnings.

An example will illustrate the inequities possible under such circumstances. Let's suppose that you had a $100,000 savings account earning 8% interest and "managed" by a trustee who could decide each year what portion of the interest you were to be paid in cash. Interest not paid out would be "retained earnings" added to the savings account to compound. And let's suppose that your trustee, in his superior wisdom, set the "pay-out ratio" at one-quarter of the annual earnings.

Under these assumptions, your account would be worth $179,084 at the end of ten years. Additionally, your annual earnings would have increased about 70% from $8,000 to $13,515 under this inspired management. And, finally, your "dividends" would have increased commensurately, rising regularly from $2,000 in the first year to $3,378 in the tenth year. Each year, when your manager's public relations firm prepared his annual report to you, all of the charts would have had lines marching skyward.

Now, just for fun, let's push our scenario one notch further and give your trustee-manager a ten-year fixed-price option on

part of your "business" (i.e., your savings account) based on its fair value in the first year. With such an option, your manager would reap a substantial profit at your expense-just from having held on to most of your earnings. If he were both Machiavellian and a bit of a mathematician, your manager might also have cut the pay-out ratio once he was firmly entrenched.

This scenario is not as farfetched as you might think. Many stock options in the corporate world have worked in exactly that fashion: they have gained in value simply because management retained earnings, not because it did well with the capital in its hands.

Managers actually apply a double standard to options. Leaving aside warrants (which deliver the issuing corporation immediate and substantial compensation), I believe it is fair to say that nowhere in the business world are ten-year, fixed-price options on all or a portion of a business granted to outsiders. Ten months, in fact, would be regarded as extreme. It would be particularly unthinkable for managers to grant a long-term option on a business that was regularly adding to its capital. Any outsider wanting to secure such an option would be required to pay fully for capital added during the option period.

The unwillingness of managers to do-unto-outsiders, however, is not matched by an unwillingness to do-unto-themselves. (Negotiating with one's self seldom produces a barroom brawl.) Managers regularly engineer ten-year, fixed-price options for themselves and associates that, first, totally ignore the fact that retained earnings automatically build value and, second, ignore the carrying cost of capital. As a result, these managers end up profiting much as they would have had they had an option on that savings account that was automatically building up in value.

Of course, stock options often go to talented, value-adding managers and sometimes deliver them rewards that are perfectly appropriate. (Indeed, managers who are really exceptional almost always get far less than they should.) But when the result is equitable, it is accidental. Once granted, the option is blind to individual performance. Because it is irrevocable and unconditional (so long as a manager stays in the company), the sluggard receives rewards from his options precisely as does the star. A managerial Rip Van Winkle, ready to doze for ten years, could not wish for a better "incentive" system.

(I can't resist commenting on one long-term option given an "outsider": that granted the U.S. Government on Chrysler shares as partial consideration for the government's guarantee of some

life-saving loans. When these options worked out well for the government, Chrysler sought to modify the payoff, arguing that the rewards to the government were both far greater than intended and outsize in relation to its contribution to Chrysler's recovery. The company's anguish over what it saw as an imbalance between payoff and performance made national news. That anguish may well be unique: to my knowledge, no managers-anywhere-have been similarly offended by unwarranted payoffs arising from options granted to themselves or their colleagues.)

Ironically, the rhetoric about options frequently describes them as desirable because they put managers and owners in the same financial boat. In reality, the boats are far different. No owner has ever escaped the burden of capital costs, whereas a holder of a fixed-price option bears no capital costs at all. An owner must weigh upside potential against downside risk; an option holder has no downside. In fact, the business project in which you would wish to have an option frequently is a project in which you would reject ownership. (I'll be happy to accept a lottery ticket as a gift-but I'll never buy one.)

In dividend policy also, the option holders' interests are best served by a policy that may ill serve the owner. Think back to the savings account example. The trustee, holding his option, would benefit from a no-dividend policy. Conversely, the owner of the account should lean to a total payout so that he can prevent the option-holding manager from sharing in the account's retained earnings.[14]

Despite their shortcomings, options can be appropriate under some circumstances. My criticism relates to their indiscriminate use and, in that connection, I would like to emphasize three points:

First, stock options are inevitably tied to the overall performance of a corporation. Logically, therefore, they should be awarded only to those managers with overall responsibility. Managers with limited areas of responsibility should have incentives that payoff in relation to results under their control. The .350 hitter expects, and also deserves, a big payoff for his performance-even if he plays for a cellar-dwelling team. And the .150 hitter should get no reward-even if he plays for a pennant winner. Only those with overall responsibility for the team should have their rewards tied to its results.

---

14 [*See* the essay Dividend Policy in Part III.C.]

Second, options should be structured carefully. Absent special factors, they should have built into them a retained-earnings or carrying-cost factor. Equally important, they should be priced realistically. When managers are faced with offers for their companies, they unfailingly point out how unrealistic market prices can be as an index of real value. But why, then, should these same depressed prices be the valuations at which managers sell portions of their businesses to themselves? (They may go further: officers and directors sometimes consult the Tax Code to determine the *lowest* prices at which they can, in effect, sell part of the business to insiders. While they're at it, they often elect plans that produce the *worst* tax result for the company.) Except in highly unusual cases, owners are not well served by the sale of part of their business at a bargain price-whether the sale is to outsiders or to insiders. The obvious conclusion: options should be priced at true business value.

Third, I want to emphasize that some managers whom I admire enormously-and whose operating records are far better than mine-disagree with me regarding fixed-price options. They have built corporate cultures that work, and fixed-price options have been a tool that helped them. By their leadership and example, and by the use of options as incentives, these managers have taught their colleagues to think like owners. Such a culture is rare and when it exists should perhaps be left intact-despite inefficiencies and inequities that may infest the option program. "If it ain't broke, don't fix it" is preferable to "purity at any price".

At Berkshire, however, we use an incentive-compensation system that rewards key managers for meeting targets in their own bailiwicks. If See's does well, that does not produce incentive compensation at the News-nor vice versa. Neither do we look at the price of Berkshire stock when we write bonus checks. We believe good unit performance should be rewarded whether Berkshire stock rises, falls, or stays even. Similarly, we think average performance should earn no special rewards even if our stock should soar. "Performance", furthermore, is defined in different ways depending upon the underlying economics of the business: in some our managers enjoy tailwinds not of their own making, in others they fight unavoidable headwinds.

The rewards that go with this system can be large. At our various business units, top managers sometimes receive incentive bonuses of five times their base salary, or more, and it would appear possible that one manager's bonus could top $2 million in 1986. (I hope so.) We do not put a cap on bonuses, and the potential for

rewards is not hierarchical. The manager of a relatively small unit can earn far more than the manager of a larger unit if results indicate he should. We believe, further, that such factors as seniority and age should not affect incentive compensation (though they sometimes influence basic compensation.) A 20 year-old who can hit .300 is as valuable to us as a 40 year-old performing as well.

Obviously, all Berkshire managers can use their bonus money (or other funds, including borrowed money) to buy our stock in the market. Many have done just that-and some now have large holdings. By accepting both the risks and the carrying cost that go with outright purchases, these managers truly walk in the shoes of owners.

At Berkshire, we try to be as logical about compensation as about capital allocation. For example, we compensate Ralph Schey based upon the results of Scott Fetzer rather than those of Berkshire. What could make more sense, since he's responsible for one operation but not the other? A cash bonus or a stock option tied to the fortunes of Berkshire would provide totally capricious rewards to Ralph. He could, for example, be hitting home runs at Scott Fetzer while Charlie and I rang up mistakes at Berkshire, thereby negating his efforts many times over. Conversely, why should option profits or bonuses be heaped upon Ralph if good things are occurring in other parts of Berkshire but Scott Fetzer is lagging?

In setting compensation, we like to hold out the promise of large carrots, but make sure their delivery is tied directly to results in the area that a manager controls. When capital invested in an operation is significant, we also both charge managers a high rate for incremental capital they employ and credit them at an equally high rate for capital they release.

The product of this money's-not-free approach is definitely visible at Scott Fetzer. If Ralph can employ incremental funds at good returns, it pays him to do so: His bonus increases when earnings on additional capital exceed a meaningful hurdle charge. But our bonus calculation is symmetrical: If incremental investment yields sub-standard returns, the shortfall is costly to Ralph as well as to Berkshire. The consequence of this two-way arrangement is that it pays Ralph-and pays him well-to send to Omaha any cash he can't advantageously use in his business.

It has become fashionable at public companies to describe almost every compensation plan as aligning the interests of manage-

ment with those of shareholders. In our book, alignment means being a partner in both directions, not just on the upside. Many "alignment" plans flunk this basic test, being artful forms of "heads I win, tails you lose."

A common form of misalignment occurs in the typical stock option arrangement, which does not periodically increase the option price to compensate for the fact that retained earnings are building up the wealth of the company. Indeed, the combination of a ten-year option, a low dividend payout, and compound interest can provide lush gains to a manager who has done no more than tread water in his job. A cynic might even note that when payments to owners are held down, the profit to the option-holding manager increases. I have yet to see this vital point spelled out in a proxy statement asking shareholders to approve an option plan.

I can't resist mentioning that our compensation arrangement with Ralph Schey was worked out in about five minutes, immediately upon our purchase of Scott Fetzer and without the "help" of lawyers or compensation consultants. This arrangement embodies a few very simple ideas-not the kind of terms favored by consultants who cannot easily send a large bill unless they have established that you have a large problem (and one, of course, that requires an annual review). Our agreement with Ralph has never been changed. It made sense to him and to me in 1986, and it makes sense now. Our compensation arrangements with the managers of all our other units are similarly simple, though the terms of each agreement vary to fit the economic characteristics of the business at issue, the existence in some cases of partial ownership of the unit by managers, etc.

In all instances, we pursue rationality. Arrangements that pay off in capricious ways, unrelated to a manager's personal accomplishments, may well be welcomed by certain managers. Who, after all, refuses a free lottery ticket? But such arrangements are wasteful to the company and cause the manager to lose focus on what should be his real areas of concern. Additionally, irrational behavior at the parent may well encourage imitative behavior at subsidiaries.

At Berkshire, only Charlie and I have the managerial responsibility for the entire business. Therefore, we are the only parties who should logically be compensated on the basis of what the enterprise does as a whole. Even so, that is not a compensation arrangement we desire. We have carefully designed both the company and our jobs so that we do things we enjoy with people

we like. Equally important, we are forced to do very few boring or unpleasant tasks. We are the beneficiaries as well of the abundant array of material and psychic perks that flow to the heads of corporations. Under such idyllic conditions, we don't expect shareholders to ante up loads of compensation for which we have no possible need.

Indeed, if we were not paid at all, Charlie and I would be delighted with the cushy jobs we hold. At bottom, we subscribe to Ronald Reagan's creed: "It's probably true that hard work never killed anyone, but I figure why take the chance."

We made a sizable acquisition in 1991-the H.H. Brown Shoe Co.[,] ... the leading North American manufacturer of work shoes and boots, and it has a history of earning unusually fine margins on sales and assets. Shoes are a tough business-of the billion pairs purchased in the United States each year, about 85% are imported-and most manufacturers in the industry do poorly. The wide range of styles and sizes that producers offer causes inventories to be heavy; substantial capital is also tied up in receivables....

A distinguishing characteristic of H.H. Brown is one of the most unusual compensation systems I've encountered-but one that warms my heart: A number of key managers are paid an annual salary of $7,800, to which is added a designated percentage of the profits of the company after these are reduced by a charge for capital employed. These managers therefore truly stand in the shoes of owners. In contrast, most managers talk the talk but don't walk the walk, choosing instead to employ compensation systems that are long on carrots but short on sticks (and that almost invariably treat equity capital as if it were cost-free). The arrangement at Brown, in any case, has served both the company and its managers exceptionally well, which should be no surprise: Managers eager to bet heavily on their abilities usually have plenty of ability to bet on.

II. CORPORATE FINANCE AND INVESTING

We bought all of our [Washington Post Company ("WPC")] holdings in mid~1973 at a price of not more than one-fourth of the then per-share business value of the enterprise. Calculating the price/value ratio required no unusual insights. Most security analysts, media brokers, and media executives would have estimated WPC's intrinsic business value at $400 to $500 million just as we did. And its $100 million stock market valuation was published daily for all to see. Our advantage, rather, was attitude: we had learned from Ben Graham that the key to successful investing was the purchase of shares in good businesses when market prices were at a large discount from underlying business values.

Most institutional investors in the early 1970s, on the other hand, regarded business value as of only minor relevance when they were deciding the prices at which they would buy or sell. This now seems hard to believe. However, these institutions were then under the spell of academics at prestigious business schools who were preaching a newly-fashioned theory: the stock market was totally efficient, and therefore calculations of business value-and even thought, itself-were of no importance in investment activities. (We are enormously indebted to those academics: what could be more advantageous in an intellectual contest-whether it be bridge, chess, or stock selection-than to have opponents who have been taught that thinking is a waste of energy?)15

A. *Mr. Market*[16]

Whenever Charlie and I buy common stocks for Berkshire's insurance companies (leaving aside arbitrage purchases, discussed [in the next essay]) we approach the transaction as if we were buying into a private business. We look at the economic prospects of the business, the people in charge of running it, and the price we must pay. We do not have in mind any time or price for sale. Indeed, we are willing to hold a stock indefinitely so long as we expect the business to increase in intrinsic value at a satisfactory rate. When investing, we view ourselves as business analysts-not as market analysts, not as macroeconomic analysts, and not even as security analysts.

Our approach makes an active trading market useful, since it periodically presents us with mouth-watering opportunities. But by

15 [First two introductory paragraphs, 1985.]
16 [1987.]

no means is it essential: a prolonged suspension of trading in the securities we hold would not bother us any more than does the lack of daily quotations on World Book or Fechheimer. Eventually, our economic fate will be determined by the economic fate of the business we own, whether our ownership is partial or total.

Ben Graham, my friend and teacher, long ago described the mental attitude toward market fluctuations that I believe to be most conducive to investment success. He said that you should imagine market quotations as coming from a remarkably accommodating fellow named Mr. Market who is your partner in a private business. Without fail, Mr. Market appears daily and names a price at which he will either buy your interest or sell you his.

Even though the business that the two of you own may have economic characteristics that are stable, Mr. Market's quotations will be anything but. For, sad to say, the poor fellow has incurable emotional problems. At times he feels euphoric and can see only the favorable factors affecting the business. When in that mood, he names a very high buy-sell price because he fears that you will snap up his interest and rob him of imminent gains. At other times he is depressed and can see nothing but trouble ahead for both the business and the world. On these occasions he will name a very low price, since he is terrified that you will unload your interest on him.

Mr. Market has another endearing characteristic: He doesn't mind being ignored. If his quotation is uninteresting to you today, he will be back with a new one tomorrow. Transactions are strictly at your option. Under these conditions, the more manic-depressive his behavior, the better for you.

But, like Cinderella at the ball, you must heed one warning or everything will turn into pumpkins and mice: Mr. Market is there to serve you, not to guide you. It is his pocketbook, not his wisdom, that you will find useful. If he shows up some day in a particularly foolish mood, you are free to either ignore him or to take advantage of him, but it will be disastrous if you fall under his influence. Indeed, if you aren't certain that you understand and can value your business far better than Mr. Market you don't belong in the game. As they say in poker, "If you've been in the game 30 minutes and you don't know who the patsy is, *you're* the patsy."

Ben's Mr. Market allegory may seem out-of-date in today's investment world, in which most professionals and academicians talk of efficient markets, dynamic hedging and betas. Their interest in such matters is understandable, since techniques shrouded in mystery clearly have value to the purveyor of investment advice.

After all, what witch doctor has ever achieved fame and fortune by simply advising "Take two aspirins"?

The value of market esoterica to the consumer of investment advice is a different story. In my opinion, investment success will not be produced by arcane formulae, computer programs or signals flashed by the price behavior of stocks and markets. Rather an investor will succeed by coupling good business judgment with an ability to insulate his thoughts and behavior from the super-contagious emotions that swirl about the marketplace. In my own efforts to stay insulated, I have found it highly useful to keep Ben's Mr. Market concept firmly in mind.

Following Ben's teachings, Charlie and I let our marketable equities tell us by their operating results-not by their daily, or even yearly, price quotations-whether our investments are successful. The market may ignore business success for a while, but eventually will confirm it. As Ben said: "In the short run, the market is a voting machine but in the long run it is a weighing machine." The speed at which a business's success is recognized, furthermore, is not that important as long as the company's intrinsic value is increasing at a satisfactory rate. In fact, delayed recognition can be an advantage: It may give us the chance to buy more of a good thing at a bargain price.

Sometimes, of course, the market may judge a business to be more valuable than the underlying facts would indicate it is. In such a case, we will sell our holdings. Sometimes, also, we will sell a security that is fairly valued or even undervalued because we require funds for a still more undervalued investment or one we believe we understand better.

We need to emphasize, however, that we do not sell holdings just because they have appreciated or because we have held them for a long time. (Of Wall Street maxims the most foolish may be "You can't go broke taking a profit.") We are quite content to hold any security indefinitely, so long as the prospective return on equity capital of the underlying business is satisfactory, management is competent and honest, and the market does not overvalue the business.

However, our insurance companies own three marketable common stocks that we would not sell even though they became far overpriced in the market. In effect, we view these investments exactly like our successful controlled businesses-a permanent part of Berkshire rather than merchandise to be disposed of once Mr. Market offers us a sufficiently high price. To that, I will add one

qualifier: These stocks are held by our insurance companies and we would, if absolutely necessary, sell portions of our holdings to pay extraordinary insurance losses. We intend, however, to manage our affairs so that sales are never required.

A determination to have and to hold, which Charlie and I share, obviously involves a mixture of personal and financial considerations. To some, our stand may seem highly eccentric. (Charlie and I have long followed David Ogilvy's advice: "Develop your eccentricities while you are young. That way, when you get old, people won't think you're going ga-ga.") Certainly, in the transaction-fixated Wall Street of recent years, our posture must seem odd: To many in that arena, both companies and stocks are seen only as raw material for trades.

Our attitude, however, fits our personalities and the way we want to live our lives. Churchill once said, "You shape your houses and then they shape you." We know the manner in which we wish to be shaped. For that reason, we would rather achieve a return of X while associating with people whom we strongly like and admire than realize 110% of X by exchanging these relationships for uninteresting or unpleasant ones.

B. *Arbitrage*[17]

[O]ur insurance subsidiaries sometimes engage in arbitrage as an alternative to holding short-term cash equivalents. We prefer, of course, to make major long-term commitments, but we often have more cash than good ideas. At such times, arbitrage sometimes promises much greater returns than Treasury Bills and, equally important, cools any temptation we may have to relax our standards for long-term investments. (Charlie's signoff after we've talked about an arbitrage commitment is usually: "Okay, at least it will keep you out of bars.")

During 1988 we made unusually large profits from arbitrage, measured both by absolute dollars and rate of return. Our pre-tax gain was about $78 million on average invested funds of about $147 million.

This level of activity makes some detailed discussion of arbitrage and our approach to it appropriate. Once, the word applied only to the simultaneous purchase and sale of securities or foreign exchange in two different markets. The goal was to exploit tiny price differentials that might exist between, say, Royal Dutch stock

---

17 [Divided by hash lines: 1988; 1989.]

trading in guilders in Amsterdam, pounds in London, and dollars in New York. Some people might call this scalping: it won't surprise you that practitioners opted for the French term, arbitrage.

Since World War I the definition of arbitrage-or "risk arbitrage," as it is now sometimes called-has expanded to include the pursuit of profits from an announced corporate event such as sale of the company, merger, recapitalization, reorganization, liquidation, self-tender, etc. In most cases the arbitrageur expects to profit regardless of the behavior of the stock market. The major risk he usually faces instead is that the announced event won't happen.

Some offbeat opportunities occasionally arise in the arbitrage field. I participated in one of these when I was 24 and working in New York for Graham-Newman Corp. Rockwood & Co., a Brooklyn-based chocolate products company of limited profitability, had adopted LIFO inventory valuation in 1941 when cocoa was selling for 5 cents per pound. In 1954 a temporary shortage of cocoa caused the price to soar to over 60 cents. Consequently Rockwood wished to unload its valuable inventory-quickly, before the price dropped. But if the cocoa had simply been sold off, the company would have owed close to a 50% tax on the proceeds.

The 1954 Tax Code came to the rescue. It contained an arcane provision that eliminated the tax otherwise due on LIFO profits if inventory was distributed to shareholders as part of a plan reducing the scope of a corporation's business. Rockwood decided to terminate one of its businesses, the sale of cocoa butter, and said 13 million pounds of its cocoa bean inventory was attributable to that activity. Accordingly, the company offered to repurchase its stock in exchange for the cocoa beans it no longer needed, paying 80 pounds of beans for each share.

For several weeks I busily bought shares, sold beans, and made periodic stops at Schroeder Trust to exchange stock certificates for warehouse receipts. The profits were good and my only expense was subway tokens.

The architect of Rockwood's restructuring was an unknown, but brilliant Chicagoan, Jay Pritzker, then 32. If you're familiar with Jay's subsequent record, you won't be surprised to hear the action worked out rather well for Rockwood's continuing shareholders also. From shortly before the tender until shortly after it, Rockwood stock appreciated from 15 to 100, even though the company was experiencing large operating losses. Sometimes there is more to stock valuation than price-earnings ratios.

In recent years, most arbitrage operations have involved takeovers, friendly and unfriendly. With acquisition fever rampant, with anti-trust challenges almost non-existent, and with bids often ratcheting upward, arbitrageurs have prospered mightily. They have not needed special talents to do well; the trick, à la Peter Sellers in the movie, has simply been "Being There." In Wall Street the old proverb has been reworded: "Give a man a fish and you feed him for a day. Teach him how to arbitrage and you feed him forever." (If, however, he studied at the Ivan Boesky School of Arbitrage, it may be a state institution that supplies his meals.)

To evaluate arbitrage situations you must answer four questions: (1) How likely is it that the promised event will indeed occur? (2) How long will your money be tied up? (3) What chance is there that something still better will transpire-a competing takeover bid, for example? and (4) What will happen if the event does not take place because of anti-trust action, financing glitches, etc.?

Arcata Corp., one of our more serendipitous arbitrage experiences, illustrates the twists and turns of the business. On September 28, 1981 the directors of Arcata agreed in principle to sell the company to Kohlberg Kravis Roberts & Co. (KKR), then and now a major leveraged-buyout firm. Arcata was in the printing and forest products businesses and had one other thing going for it: In 1978 the U.S. Government had taken title to 10,700 acres of Arcata timber, primarily old-growth redwood, to expand Redwood National Park. The government had paid $97.9 million, in several installments, for this acreage, a sum Arcata was contesting as grossly inadequate. The parties also disputed the interest rate that should apply to the period between the taking of the property and final payment for it. The enabling legislation stipulated 6% simple interest; Arcata argued for a much higher and compounded rate.

Buying a company with a highly-speculative, large-sized claim in litigation creates a negotiating problem, whether the claim is on behalf of or against the company. To solve this problem, KKR offered $37.00 per Arcata share plus two-thirds of any additional amounts paid by the government for the redwood lands.

Appraising this arbitrage opportunity, we had to ask ourselves whether KKR would consummate the transaction since, among other things, its offer was contingent upon its obtaining "satisfactory financing." A clause of this kind is always dangerous for the seller: It offers an easy exit for a suitor whose ardor fades between proposal and marriage. However, we were not particularly worried

about this possibility because KKR's past record for closing had been good.

We also had to ask ourselves what would happen if the KKR deal did fall through, and here we also felt reasonably comfortable: Arcata's management and directors had been shopping the company for some time and were clearly determined to sell. If KKR went away, Arcata would likely find another buyer, though of course, the price might be lower.

Finally, we had to ask ourselves what the redwood claim might be worth. Your Chairman, who can't tell an elm from an oak, had no trouble with that one: He coolly evaluated the claim at somewhere between zero and a whole lot.

We started buying Arcata stock, then around $33.50, on September 30 and in eight weeks purchased about 400,000 shares, or 5% of the company. The initial announcement said that the $37.00 would be paid in January, 1982. Therefore, if everything had gone perfectly, we would have achieved an annual rate of return of about 40%-not counting the redwood claim, which would have been frosting.

All did not go perfectly. In December it was announced that the closing would be delayed a bit. Nevertheless, a definitive agreement was signed on January 4. Encouraged, we raised our stake, buying at around $38.00 per share and increasing our holdings to 655,000 shares, or over 7% of the company. Our willingness to pay up-even though the closing had been postponed-reflected our leaning toward "a whole lot" rather than "zero" for the redwoods.

Then, on February 25 the lenders said they were taking a "second look" at financing terms "in view of the severely depressed housing industry and its impact on Arcata's outlook." The stockholders' meeting was postponed again, to April. An Arcata spokesman said he "did not think the fate of the acquisition itself was imperiled." When arbitrageurs hear such reassurances, their minds flash to the old saying: "He lied like a finance minister on the eve of devaluation."

On March 12 KKR said its earlier deal wouldn't work, first cutting its offer to $33.50, then two days later raising it to $35.00. On March 15, however, the directors turned this bid down and accepted another group's offer of $37.50 plus one-half of any redwood recovery. The shareholders okayed the deal, and the $37.50 was paid on June 4.

We received $24.6 million versus our cost of $22.9 million; our average holding period was close to six months. Considering the trouble this transaction encountered, our 15% annual rate of return-excluding any value for the redwood claim-was more than satisfactory.

But the best was yet to come. The trial judge appointed two commissions, one to look at the timber's value, the other to consider the interest rate questions. In January 1987, the first commission said the redwoods were worth $275.7 million and the second commission recommended a compounded, blended rate of return working out to about 14%.

In August 1987 the judge upheld these conclusions, which meant a net amount of about $600 million would be due Arcata. The government then appealed. In 1988, though, before this appeal was heard, the claim was settled for $519 million. Consequently, we received an additional $29.48 per share, or about $19.3 million. We will get another $800,000 or so in 1989.

Berkshire's arbitrage activities differ from those of many arbitrageurs. First, we participate in only a few, and usually very large, transactions each year. Most practitioners buy into a great many deals-perhaps 50 or more per year. With that many irons in the fire, they must spend most of their time monitoring both the progress of deals and the market movements of the related stocks. This is not how Charlie nor I wish to spend our lives. (What's the sense in getting rich just to stare at a ticker tape all day?)

Because we diversify so little, one particularly profitable or unprofitable transaction will affect our yearly result from arbitrage far more than it will the typical arbitrage operation. So far, Berkshire has not had a really bad experience. But we will-and when it happens we'll report the gory details to you.

The other way we differ from some arbitrage operations is that we participate only in transactions that have been publicly announced. We do not trade on rumors or try to guess takeover candidates. We just read the newspapers, think about a few of the big propositions, and go by our own sense of probabilities.

At yearend, our only major arbitrage position was 3,342,000 shares of RJR Nabisco with a cost of $281.8 million and a market value of $304.5 million. In January we increased our holdings to roughly four million shares and in February we eliminated our position. About three million shares were accepted when we tendered our holdings to KKR, which acquired RJR, and the returned

shares were promptly sold in the market. Our pre-tax profit was a better-than-expected $64 million.

Earlier, another familiar face turned up in the RJR bidding contest: Jay Pritzker, who was part of a First Boston group that made a tax-oriented offer. To quote Yogi Berra; "It was déjà vu all over again."

During most of the time when we normally would have been purchasers of RJR, our activities in the stock were restricted because of Salomon's participation in a bidding group. Customarily, Charlie and I, though we are directors of Salomon, are walled off from information about its merger and acquisition work. We have asked that it be that way: The information would do us no good and could, in fact, occasionally inhibit Berkshire's arbitrage operations.

However, the unusually large commitment that Salomon proposed to make in the RJR deal required that all directors be fully informed and involved. Therefore, Berkshire's purchases of RJR were made at only two times: first, in the few days immediately following management's announcement of buyout plans, before Salomon became involved; and considerably later, after the RJR board made its decision in favor of KKR. Because we could not buy at other times, our directorships cost Berkshire significant money.

Considering Berkshire's good results in 1988, you might expect us to pile into arbitrage during 1989. Instead, we expect to be on the sidelines.

One pleasant reason is that our cash holdings are down-because our position in equities that we expect to hold for a very long time is substantially up. As regular readers of this report know, our new commitments are not based on a judgment about short-term prospects for the stock market. Rather, they reflect an opinion about long-term business prospects for specific companies. We do not have, never have had, and never will have an opinion about where the stock market, interest rates, or business activity will be a year from now.

Even if we had a lot of cash we probably would do little in arbitrage in 1989. Some extraordinary excesses have developed in the takeover field. As Dorothy says: "Toto, I have a feeling we're not in Kansas any more."

We have no idea how long the excesses will last, nor do we know what will change the attitudes of government, lender and buyer that fuel them. But we do know that the less the prudence

with which others conduct their affairs, the greater the prudence with which we should conduct our own affairs. We have no desire to arbitrage transactions that reflect the unbridled - and, in our view, often unwarranted-optimism of both buyers and lenders. In our activities, we will heed the wisdom of Herb Stein: "If something can't go on forever, it will end."

We told you last year that we expected to do little in arbitrage during 1989, and that's the way it turned out. Arbitrage positions are a substitute for short-term cash equivalents, and during part of the year we held relatively low levels of cash. In the rest of the year we had a fairly good-sized cash position and even so chose not to engage in arbitrage. The main reason was corporate transactions that made no economic sense to us; arbitraging such deals comes too close to playing the greater-fool game. (As Wall Streeter Ray DeVoe says: "Fools rush in where angels fear to trade.") We will engage in arbitrage from time to time-sometimes on a large scale-but only when we like the odds.

C. *Debunking Standard Dogma*[18]

The preceding discussion about arbitrage makes a small discussion of "efficient market theory" (EMT) also seem relevant. This doctrine became highly fashionable-indeed, almost holy scripture-in academic circles during the 1970s. Essentially, it said that analyzing stocks was useless because all public information about them was appropriately reflected in their prices. In other words, the market always knew everything. As a corollary, the professors who taught EMT said that someone throwing darts at the stock tables could select a stock portfolio having prospects just as good as one selected by the brightest, most hard-working securityanalyst. Amazingly, EMTwas embraced not only by academics, but by many investment professionals and corporate managers as well. Observing correctly that the market was *frequently* efficient, they went on to conclude incorrectly that it was *always* efficient. The difference between these propositions is night and day.

In my opinion, the continuous 63-year arbitrage experience of Graham-Newman Corp., Buffett Partnership, and Berkshire illustrates just how foolish EMT is. (There's plenty of other evidence, also.) While at Graham-Newman, I made a study of its earnings from arbitrage during the entire 1926-1956 lifespan of the com-

---

18 [Divided by hash lines: 1988; 1988; 1993; 1986; 1991; 1987.]

pany. Unleveraged returns averaged 20% per year. Starting in 1956, I applied Ben Graham's arbitrage principles, first at Buffett Partnership and then Berkshire. Though I've not made an exact calculation, I have done enough work to know that the 1956-1988 returns averaged well over 20%. (Of course, I operated in an environment far more favorable than Ben's; he had 1929-1932 to contend with.)

All of the conditions are present that are required for a fair test of portfolio performance: (1) the three organizations traded hundreds of different securities while building this 63-year record; (2) the results are not skewed by a few fortunate experiences; (3) we did not have to dig for obscure facts or develop keen insights about products or managements-we simply acted on highly-publicized events; and (4) our arbitrage positions were a clearly identified universe-they have not been selected by hindsight.

Over the 63 years, the general market delivered just under a 10% annual return, including dividends. That means $1,000' would have grown to $405,000 if all income had been reinvested. A 20% rate of return, however, would have produced $97 million. That strikes us a statistically-significant differential that might, conceivably, arouse one's curiosity.

Yet proponents of the theory have never seemed interested in discordant evidence of this type. True, they don't talk quite as much about their theory today as they used to. But no one, to my knowledge, has ever said he was wrong, no matter how many thousands of students he has sent forth misinstructed. EMT, moreover, continues to be an integral part of the investment curriculum at major business schools. Apparently, a reluctance to recant, and thereby to demystify the priesthood, is not limited to theologians.

Naturally the disservice done students and gullible investment professionals who have swallowed EMT has been an extraordinary service to us and other followers of Graham. In any sort of a contest-financial, mental, or physical-it's an enormous advantage to have opponents who have been taught that it's useless to even try. From a selfish point of view, Grahamites should probably endow chairs to ensure the perpetual teaching of EMT.

All this said, a warning is appropriate. Arbitrage has looked easy recently. But this is not a form of investing that guarantees profits of 20% a year or, for that matter, profits of any kind. As noted, the market is reasonably efficient much of the time: For every arbitrage opportunity we seized in that 63-year period, many more were foregone because they seemed properly-priced.

An investor cannot obtain superior profits from stocks by simply committing to a specific investment category or style. He can earn them only by carefully evaluating facts and continuously exercising discipline. Investing in arbitrage situations, per se, is no better a strategy than selecting a portfolio by throwing darts.

[W]hen we own portions of outstanding businesses with outstanding managements, our favorite holding period is forever. We are just the opposite of those who hurry to sell and book profits when companies perform well but who tenaciously hang on to businesses that disappoint. Peter Lynch aptly likens such behavior to cutting the flowers and watering the weeds.

[W]e continue to think that it is usually foolish to part with an interest in a business that is both understandable and durably wonderful. Business interests of that kind are simply too hard to replace.

Interestingly, corporate managers have no trouble understanding that point when they are focusing on a business they operate: A parent company that owns a subsidiary with superb long-term economics is not likely to sell that entity regardless of price. "Why," the CEO would ask, "should I part with my crown jewel?" Yet that same CEO, when it comes to running his personal investment portfolio, will offhandedly-and even impetuously-move from business to business when presented with no more than superficial arguments by his broker for doing so. The worst of these is perhaps, "You can't go broke taking a profit." Can you imagine a CEO using this line to urge his board to sell a star subsidiary? **In** our view, what makes sense in business also makes sense in stocks: An investor should ordinarily hold a small piece of an outstanding business with the same tenacity that an owner would exhibit if he owned all of that business.

Earlier I mentioned the financial results that could have been achieved by investing $40 in The Coca-Cola Co. in 1919.[19] **In** 1938, more than 50 years after the introduction of Coke, and long after

---

19 [A separate paragraph from this 1993 letter provided as follows:]

Let me add a lesson from history: Coke went public in 1919 at $40 per share. By the end of 1920 the market, coldly reevaluating Coke's future prospects, had battered the stock down by more than 50%, to $19.50. At yearend 1993, that single share, with dividends reinvested, was worth more than $2.1 million. As Ben Graham said: "In the short-run, the market is a voting machine-reflecting a voter-registration test that requires only money, not intelligence or emotional stability-but in the long-run, the market is a weighing machine."

the drink was firmly established as an American icon, *Fortune* did an excellent story on the company. In the second paragraph the writer reported: "Several times every year a weighty and serious investor looks long and with profound respect at Coca-Cola's record, but comes regretfully to the conclusion that he is looking too late. The specters of saturation and competition rise before him."

Yes, competition there was in 1938 and in 1993 as well. But it's worth noting that in 1938 The Coca-Cola Co. sold 207 million cases of soft drinks (if its gallonage then is converted into the 192-ounce cases used for measurement today) and in 1993 it sold about 10.7 billion cases, a 50-fold increase in physical volume from a company that in 1938 was already dominant in its very major industry. Nor was the party over in 1938 for an investor: Though the $40 invested in 1919 in one share had (with dividends reinvested) turned into $3,277 by the end of 1938, a fresh $40 then invested in Coca-Cola stock would have grown to $25,000 by yearend 1993.

I can't resist one more quote from that 1938 *Fortune* story: "It would be hard to name any company comparable in size to Coca-Cola and selling, as Coca-Cola does, an unchanged product that can point to a ten-year record anything like Coca-Cola's." In the 55 years that have since passed, Coke's product line has broadened somewhat, but it's remarkable how well that description still fits.

Charlie and I decided long ago that in an investment lifetime it's too hard to make hundreds of smart decisions. That judgment became ever more compelling as Berkshire's capital mushroomed and the universe of investments that could significantly affect our results shrank dramatically. Therefore, we adopted a strategy that required our being smart-and not too smart at that-only a very few times. Indeed, we'll now settle for one good idea a year. (Charlie says it's my turn.)

The strategy we've adopted precludes our following standard diversification dogma. Many pundits would therefore say the strategy must be riskier than that employed by more conventional investors. We disagree. We believe that a policy of portfolio concentration may well *decrease* risk if it raises, as it should, both the intensity with which an investor thinks about a business and the comfort-level he must feel with its economic characteristics before buying into it. In stating this opinion, we define risk, using dictionary terms, as "the possibility of loss or injury."

Academics, however, like to define investment "risk" differently, averring that it is the relative volatility of a stock or portfolio of stocks-that is, their volatility as compared to that of a large

universe of stocks. Employing data bases and statistical skills, these academics compute with precision the "beta" of a stock-its relative volatility in the past-and then build arcane investment and capital-allocation theories around this calculation. In their hunger for a single statistic to measure risk, however, they forget a fundamental principle: It is better to be approximately right than precisely wrong.

For owners of a business-and that's the way we think of shareholders-the academics' definition of risk is far off the mark, so much so that it produces absurdities. For example, under beta-based theory, a stock that has dropped very sharply compared to the market-as had Washington Post when we bought it in 1973-becomes "riskier" at the lower price than it was at the higher price. Would that description have then made any sense to someone who was offered the entire company at a vastly-reduced price?

In fact, the true investor *welcomes* volatility. Ben Graham explained why in Chapter 8 of *The Intelligent Investor.* There he introduced "Mr. Market," an obliging fellow who shows up every day to either buy from you or sell to you, whichever you wish. The more manic-depressive this chap is, the greater the opportunities available to the investor. That's true because a wildly fluctuating market means that irrationally low prices will periodically be attached to solid businesses. It is impossible to see how the availability of such prices can be thought of as increasing the hazards for an investor who is totally free to either ignore the market or exploit its folly.

In assessing risk, a beta purist will disdain examining what a company produces, what its competitors are doing, or how much borrowed money the business employs. He may even prefer not to know the company's name. What he treasures is the price history of its stock. In contrast, we'll happily forgo knowing the price history and instead will seek whatever information will further our understanding of the company's business. After we buy a stock, consequently, we would not be disturbed if markets closed for a year or two. We don't need a daily quote on our 100% position in See's or H.H. Brown to validate our well-being. Why, then, should we need a quote on our 7% interest in Coke?

In our opinion, the real risk an investor must assess is whether his aggregate after-tax receipts from an investment (including those he receives on sale) will, over his prospective holding period, give him at least as much purchasing power as he had to begin with, plus a modest rate of interest on that initial stake. Though

this risk cannot be calculated with engineering precision, it can in some cases be judged with a degree of accuracy that is useful. The primary factors bearing upon this evaluation are:

1) The certainty with which the long-term economic characteristics of the business can be evaluated;
2) The certainty with which management can be evaluated, both as to its ability to realize the full potential of the business and to wisely employ its cash flows;
3) The certainty with which management can be counted on to channel the reward from the business to the shareholders rather than to itself;
4) The purchase price of the business;
5) The levels of taxation and inflation that will be experienced and that will determine the degree by which an investor's purchasing-power return is reduced from his gross return.

These factors will probably strike many analysts as unbearably fuzzy since they cannot be extracted from a data base of any kind. But the difficulty of precisely quantifying these matters does not negate their importance nor is it insuperable. Just as Justice Stewart found it impossible to formulate a test for obscenity but nevertheless asserted, "I know it when I see it," so also can investors-in an inexact but useful way-"see" the risks inherent in certain investments without reference to complex equations or price histories.

Is it really so difficult to conclude that Coca-Cola and Gillette possess far less business risk over the long term than, say, any computer company or retailer? Worldwide, Coke sells about 44% of all soft drinks, and Gillette has more than a 60% share (in value) of the blade market. Leaving aside chewing gum, in which Wrigley is dominant, I know of no other significant businesses in which the leading company has long enjoyed such global power.

Moreover, both Coke and Gillette have actually increased their worldwide shares of market in recent years. The might of their brand names, the attributes of their products, and the strength of their distribution systems give them an enormous competitive advantage, setting up a protective moat around their economic castles. The average company, in contrast, does battle daily without any such means of protection. As Peter Lynch says, stocks of companies selling commodity-like products should come with a warning label: "Competition may prove hazardous to human wealth."

The competitive strengths of a Coke or Gillette are obvious to even the casual observer of business. Yet the beta of their stocks is similar to that of a great many run-of-the-mill companies who possess little or no competitive advantage. Should we conclude from this similarity that the competitive strength of Coke and Gillette gains them nothing when business risk is being measured? Or should we conclude that the risk in owning a piece of a company-its stock-is somehow divorced from the long-term risk inherent in its business operations? We believe neither conclusion makes sense and that equating beta with investment risk makes no sense.

The theoretician bred on beta has no mechanism for differentiating the risk inherent in, say, a single-product toy company selling pet rocks or hula hoops from that of another toy company whose sole product is Monopoly or Barbie. But it's quite possible for ordinary investors to make such distinctions if they have a reasonable understanding of consumer behavior and the factors that create long-term competitive strength or weakness. Obviously, every investor will make mistakes. But by confining himself to a relatively few, easy-to-understand cases, a reasonably intelligent, informed and diligent person can judge investment risks with a useful degree of accuracy.

In many industries, of course, Charlie and I can't determine whether we are dealing with a "pet rock" or a "Barbie." We couldn't solve this problem, moreover, even if we were to spend years intensely studying those industries. Sometimes our own intellectual shortcomings would stand in the way of understanding, and in other cases the nature of the industry would be the roadblock. For example, a business that must deal with fast-moving technology is not going to lend itself to reliable evaluations of its long-term economics. Did we foresee thirty years ago what would transpire in the television-manufacturing or computer industries? Of course not. (Nor did most of the investors and corporate managers who enthusiastically entered those industries.) Why, then, should Charlie and I now think we can predict the future of other rapidly-evolving businesses? We'll stick instead with the easy cases. Why search for a needle buried in a haystack when one is sitting in plain sight?

Of course, some investment strategies-for instance, our efforts in arbitrage over the years-require wide diversification. If significant risk exists in a single transaction, overall risk should be reduced by making that purchase one of many mutually-independent commitments. Thus, you may consciously purchase a risky in-

vestment-one that indeed has a significant possibility of causing loss or injury-if you believe that your gain, weighted for probabilities, considerably exceeds your loss, comparably weighted, and if you can commit to a number of similar, but unrelated opportunities. Most venture capitalists employ this strategy. Should you choose to pursue this course, you should adopt the outlook of the casino that owns a roulette wheel, which will want to see lots of action because it is favored by probabilities; but will refuse to accept a single, huge bet.

Another situation requiring wide diversification occurs when an investor who does not understand the economics of specific businesses nevertheless believes it in his interest to be a long-term owner of American industry. That investor should both own a large number of equities and space out his purchases. By periodically investing in an index fund, for example, the know-nothing investor can actually out-perform most investment professionals. Paradoxically, when "dumb" money acknowledges its limitations, it ceases to be dumb.

On the other hand, if you are a know-something investor, able to understand business economics and to find five to ten sensibly-priced companies that possess important long-term competitive advantages, conventional diversification makes no sense for you. It is apt simply to hurt your results and increase your risk. I cannot understand why an investor of that sort elects to put money into a business that is his 20th favorite rather than simply adding that money to his top choices-the businesses he understands best and that present the least risk, along with the greatest profit potential. In the words of the prophet Mae West: "Too much of a good thing can be wonderful."

We should note that we expect to keep permanently our three primary holdings, Capital Cities/ABC, Inc., GEICO Corporation, and The Washington Post. Even if these securities were to appear significantly overpriced, we would not anticipate selling them, just as we would not sell See's or Buffalo Evening News if someone were to offer us a price far above what we believe those businesses are worth.

This attitude may seem old-fashioned in a corporate world in which activity has become the order of the day. The modern manager refers to his "portfolio" of businesses-meaning that all of them are candidates for "restructuring" whenever such a move is dictated by Wall Street preferences, operating conditions or a new

corporate "concept." (Restructuring is defined narrowly, however: it extends only to dumping offending businesses, not to dumping the officers and directors who bought the businesses in the first place. "Hate the sin but love the sinner" is a theology as popular with the Fortune 500 as it is with the Salvation Army.)

Investment managers are even more hyperkinetic: their behavior during trading hours makes whirling dervishes appear sedated by comparison. Indeed, the term "institutional investor" is becoming one of those self-contradictions called an oxymoron, comparable to "jumbo shrimp," "lady mudwrestler" and "inexpensive lawyer."

Despite the enthusiasm for activity that has swept business and financial America, we will stick with our 'til-death-do-us-part policy. It's the only one with which Charlie and I are comfortable, it produces decent results, and it lets our managers and those of our investees run their businesses free of distractions.

Our stay-put behavior reflects our view that the stock market serves as a relocation center at which money is moved from the active to the patient. (With tongue only partly in check, I suggest that recent events indicate that the much-maligned "idle rich" have received a bad rap: They have maintained or increased their wealth while many of the "energetic rich"-aggressive real estate operators, corporate acquirers, oil drillers, etc.-have seen their fortunes disappear.)

We continually search for large businesses with understandable, enduring and mouth-watering economics that are run by able and shareholder-oriented managements. This focus doesn't guarantee results: We both have to buy at a sensible price and get business performance from our companies that validates our assessment. But this investment approach-searching for the superstars-offers us our only chance for real success. Charlie and I are simply not smart enough, considering the large sums we work with, to get great results by adroitly buying and selling portions of far-from-great businesses. Nor do we think many others can achieve long-term investment success by flitting from flower to flower. Indeed, we believe that according the name "investors" to institutions that trade actively is like calling someone who repeatedly engages in one-night stands a romantic.

If my universe of business possibilities was limited, say, to private companies in Omaha, I would, first, try to assess the long-term

economic characteristics of each business; second, assess the quality of the people in charge of running it; and, third, try to buy into a few of the best operations at a sensible price. I certainly would not wish to own an equal part of every business in town. Why, then, should Berkshire take a different tack when dealing with the larger universe of public companies? And since finding great businesses and outstanding managers is so difficult, why should we discard proven products? (I was tempted to say "the real thing.") Our motto is: "If at first you do succeed, quit trying."

John Maynard Keynes, whose brilliance as a practicing investor matched his brilliance in thought, wrote a letter to a business associate, F.e. Scott, on August 15, 1934 that says it all: "As time goes on, 1 get more and more convinced that the right method in investment is to put fairly large sums into enterprises which one thinks one knows something about and in the management of which one thoroughly believes. It is a mistake to think that one limits one's risk by spreading too much between enterprises about which one knows little and has no reason for special confidence .... One's knowledge and experience are definitely limited and there are seldom more than two or three enterprises at any given time in which 1 personally feel myself entitled to put *full* confidence."

During 1987 the stock market was an area of much excitement but little net movement: The Dow advanced 2.3% for the year. You are aware, of course, of the roller coaster ride that produced this minor change. Mr. Market was on a manic rampage until October and then experienced a sudden, massive seizure.

We have "professional" investors, those who manage many billions, to thank for most of this turmoil. Instead of focusing on what businesses will do in the years ahead, many prestigious money managers now focus on what they expect other money managers to do in the days ahead. For them, stocks are merely tokens in a game, like the thimble and flatiron in Monopoly.

An extreme example of what their attitude leads to is "portfolio insurance," a money-management strategy that many leading investment advisors embraced in 1986-1987. This strategy-which is simply an exotically-labeled version of the small speculator's stop-loss order-dictates that ever-increasing portions of a stock portfolio, or their index-future equivalents, be sold as prices decline. The strategy says nothing else matters: A downtick of a given magnitude automatically produces a huge sell order. Ac-

cording to the Brady Report, $60 billion to $90 billion of equities were poised on this hair trigger in mid-October of 1987.

If you've thought that investment advisors were hired to invest, you may be bewildered by this technique. After buying a farm, would a rational owner next order his real estate agent to start selling off pieces of it whenever a neighboring property was sold at a lower price? Or would you sell your house to whatever bidder was available at 9:31 on some morning merely because at 9:30 a similar house sold for less than it would have brought on the previous day?

Moves like that, however, are what portfolio insurance tells a pension fund or university to make when it owns a portion of enterprises such as Ford or General Electric. The less these companies are being valued at, says this approach, the more vigorously they should be sold. As a "logical" corollary, the approach commands the institutions to repurchase these companies-I'm *not making this up-once* their prices have rebounded significantly. Considering that huge sums are controlled by managers following such Alice-in-Wonderland practices, is it any surprise that markets sometimes behave in aberrational fashion?

Many commentators, however, have drawn an incorrect conclusion upon observing recent events: They are fond of saying that the small investor has no chance in a market now dominated by the erratic behavior of the big boys. This conclusion is dead wrong: Such markets are ideal for any investor-small or large-so long as he sticks to his investment knitting. Volatility caused by money managers who speculate irrationally with huge sums will offer the true investor more chances to make intelligent investment moves. He can be hurt by such volatility only if he is forced, by either financial or psychological pressures, to sell at untoward times.

D. *"Value" Investing: A Redundancy*[20]

We really don't see many fundamental differences between the purchase of a controlled business and the purchase of marketable holdings . . . . In each case we try to buy into businesses with favorable long-term economics. Our goal is to find an outstanding business at a sensible price, not a mediocre business at a bargain price. Charlie and I have found that making silk purses out of silk is the best that we can do; with sow's ears, we fail.

---

20 [Divided by hash lines: 1987; 1992; 1985.]

(It must be noted that your Chairman, always a quick study, required only 20 years to recognize how important it was to buy good businesses. In the interim, I searched for "bargains"-and had the misfortune to find some. My punishment was an education in the economics of short-line farm implement manufacturers, third-place department stores, and New England textile manufacturers.)

Of course, Charlie and I may misread the fundamental economics of a business. When that happens, we will encounter problems whether that business is a wholly-owned subsidiary or a marketable security, although it is usually far easier to exit from the latter. (Indeed, businesses can be misread: Witness the European reporter who, after being sent to this country to profile Andrew Carnegie, cabled his editor, "My God, you'll never believe the sort of money there is in running libraries.") .

In making both control purchases and stock purchases, we try to buy not only good businesses, but ones run by high-grade, talented and likeable managers. If we make a mistake about the managers we link up with, the controlled company offers a certain advantage because we have the power to effect change. In practice, however, this advantage is somewhat illusory: Management changes, like marital changes, are painful, time-consuming and chancy. In any event, at our three marketable-but-permanent holdings, this point is moot: With Tom Murphy and Dan Burke at Cap Cities, Bill Snyder and Lou Simpson at GEIeO, and Kay Graham and Dick Simmons at The Washington Post, we simply couldn't be in better hands.

I would say that the controlled company offers two main advantages. First, when we control a company we get to allocate capital, whereas we are likely to have little or nothing to say about this process with marketable holdings. This point can be important because the heads of many companies are not skilled in capital allocation. Their inadequacy is not surprising. Most bosses rise to the top because they have excelled in an area such as marketing, production, engineering, administration-or, sometimes, institutional politics.

Once they become CEOs, they face new responsibilities. They now must make capital allocation decisions, a critical job that they may have never tackled and that is not easily mastered. To stretch the point, it's as if the final step for a highly-talented musician was not to perform at Carnegie Hall but, instead, to be named Chairman of the Federal Reserve.

The lack of skill that many CEOs have at capital allocation is no small matter: After ten years on the job, a CEO whose company annually retains earnings equal to 10% of net worth will have been responsible for the deployment of more than 60% of all the capital at work in the business.

CEOs who recognize their lack of capital-allocation skills (which not all do) will often try to compensate by turning to their staffs, management consultants, or investment bankers. Charlie and I have frequently observed the consequences of such "help." On balance, we feel it is more likely to accentuate the capital-allocation problem than to solve it.

In the end, plenty of unintelligent capital allocation takes place in corporate America. (That's why you hear so much about "restructuring.") Berkshire, however, has been fortunate. At the companies that are our major non-controlled holdings, capital has generally been well-deployed and, in some cases, brilliantly so.

The second advantage of a controlled company over a marketable security has to do with taxes. Berkshire, as a corporate holder, absorbs some significant tax costs through the ownership of partial positions that we do not when our ownership is 80% or greater. Such tax disadvantages have long been with us, but changes in the tax code caused them to increase significantly during [1986]. As a consequence, a given business result can now deliver Berkshire financial results that are as much as 50% better if they come from an 80%-or-greater holding rather than from a lesser holding.

The disadvantages of owning marketable securities are sometimes offset by a huge advantage: Occasionally the stock market offers us the chance to buy non-controlling pieces of extraordinary businesses at truly ridiculous prices-dramatically below those commanded in negotiated transactions that transfer control. For example, we purchased our Washington Post stock in 1973 at $5.63 per share, and per-share operating earnings in 1987 after taxes were $10.30. Similarly, our GEICO stock was purchased in 1976, 1979 and 1980 at an average of $6.67 per share, and after-tax operating earnings per share last year were $9.01. In cases such as these, Mr. Market has proven to be a mighty good friend.

Our equity-investing strategy remains little changed from what it was ... when we said in the 1977 annual report: "We select our marketable equity securities in much the way we would evaluate a business for acquisition in its entirety. We want the business to be

one (a) that we can understand; (b) with favorable long-term prospects; (c) operated by honest and competent people; and (d) available at a very attractive price." We have seen cause to make only one change in this creed: Because of both market conditions and our size, we now substitute "an attractive price" for "a very attractive price."

But how, you will ask, does one decide what's "attractive"? In answering this question, most analysts feel they must choose between two approaches customarily thought to be in opposition: "value" and "growth." Indeed, many investment professionals see any mixing of the two terms as a form of intellectual cross-dressing.

We view that as fuzzy thinking (in which, it must be confessed, I myself engaged some years ago). In our opinion, the two approaches are joined at the hip: Growth is *always* a component in the calculation of value, constituting a variable whose importance can range from negligible to enormous and whose impact can be negative as well as positive.

In addition, we think the very term "value investing" is redundant. What is "investing" if it is not the act of seeking value at least sufficient to justify the amount paid? Consciously paying more for a stock than its calculated value-in the hope that it can soon be sold for a still-higher price-should be labeled speculation (which is neither illegal, immoral nor-in our view-financially fattening).

Whether appropriate or not, the term "value investing" is widely used. Typically, it connotes the purchase of stocks having attributes such as a low ratio of price to book value, a low price-earnings ratio, or a high dividend yield. Unfortunately, such characteristics, even if they appear in combination, are far from determinative as to whether an investor is indeed buying something for what it is worth and is therefore truly operating on the principle of obtaining value in his investments. Correspondingly, opposite characteristics-a high ratio of price to book value, a high price-earnings ratio, and a low dividend yield-are in no way inconsistent with a "value" purchase.

Similarly, business growth, per se, tells us little about value. It's true that growth often has a positive impact on value, sometimes one of spectacular proportions. But such an effect is far from certain. For example, investors have regularly poured money into the domestic airline business to finance profitless (or worse) growth. For these investors, it would have been far better if Orville had failed to get off the ground at Kitty Hawk: The more the industry has grown, the worse the disaster for owners.

Growth benefits investors only when the business in point can invest at incremental returns that are enticing-in other words, only when each dollar used to finance the growth creates over a dollar of long-term market value. **In** the case of a low-return business requiring incremental funds, growth hurts the investor.

In *The Theory of Investment Value,* written over 50 years ago, John Burr Williams set forth the equation for value, which we condense here: *The value of any stock, bond or business today is determined by the cash inflows and outflows-discounted at an appropriate interest rate-that can be expected to occur during the remaining life of the asset.* Note that the formula is the same for stocks as for bonds. Even so, there is an important, and difficult to deal with, difference between the two: A bond has a coupon and maturity date that define future cash flows; but in the case of equities, the investment analyst must himself estimate the future "coupons." Furthermore, the quality of management affects the bond coupon only rarely-chiefly when management is so inept or dishonest that payment of interest is suspended. **In** contrast, the ability of management can dramatically affect the equity "coupons."

The investment shown by the discounted-flows-of-cash calculation to be the cheapest is the one that the investor should purchase-irrespective of whether the business grows or doesn't, displays volatility or smoothness in its earnings, or carries a high price or low in relation to its current earnings and book value. Moreover, though the value equation has usually shown equities to be cheaper than bonds, that result is not inevitable: When bonds are calculated to be the more attractive investment, they should be bought.

Leaving the question of price aside, the best business to own is one that over an extended period can employ large amounts of incremental capital at very high rates of return. The worst business to own is one that must, or *will,* do the opposite-that is, consistently employ ever-greater amounts of capital at very low rates of return. Unfortunately, the first type of business is very hard to find: Most high-return businesses need relatively little capital. Shareholders of such a business usually will benefit if it pays out most of its earnings in dividends or makes significant stock repurchases.

Though the mathematical calculations required to evaluate equities are not difficult, an analyst-even one who is experienced and intelligent-can easily go wrong in estimating future "coupons." At Berkshire, we attempt to deal with this problem in two

ways. First, we try to stick to businesses we believe we understand. That means they must be relatively simple and stable in character. If a business is complex or subject to constant change, we're not smart enough to predict future cash flows. Incidentally, that shortcoming doesn't bother us. What counts for most people in investing is not how much they know, but rather how realistically they define what they don't know. An investor needs to do very few things right as long as he or she avoids big mistakes.

Second, and equally important, we insist on a margin of safety in our purchase price. If we calculate the value of a common stock to be only slightly higher than its price, we're not interested in buying. We believe this margin-of-safety principle, so strongly emphasized by Ben Graham, to be the cornerstone of investment success.

. . . [A]n intelligent investor in common stocks will do better in the secondary market than he will do buying new issues . . . . The reason has to do with the way prices are set in each instance. The secondary market, which is periodically ruled by mass folly, is constantly setting a "clearing" price. No matter how foolish that price may be, it's what counts for the holder of a stock or bond who needs or wishes to sell, of whom there are always going to be a few at any moment. In many instances, shares worth *x* in business value have sold in the market for Ih.x or less.

The new-issue market, on the other hand, is ruled by controlling stockholders and corporations, who can usually select the timing of offerings or, if the market looks unfavorable, can avoid an offering altogether. Understandably, these sellers are not going to offer any bargains, either by way of a public offering or in a negotiated transaction: It's rare you'll find *x* for ½x here. Indeed, in the case of common-stock offerings, selling shareholders are often motivated to unload only when they feel the market is overpaying. (These sellers, of course, would state that proposition somewhat differently, averring instead that they simply resist selling when the market is underpaying for their goods.)

Right after yearend, Berkshire purchased 3 million shares of Capital Cities/ABC, Inc. ("Cap Cities") at $172.50 per share, the market price of such shares at the time the commitment was made early in March, 1985. I've been on record for many years about the management of Cap Cities: I think it is the best of any publicly-owned company in the country. And Tom Murphy and Dan Burke are not only great managers, they are precisely the sort of fellows

that you would want your daughter to marry. It is a privilege to be associated with them-and also a lot of fun, as any of you who know them will understand.

Our purchase of stock helped Cap Cities finance the $3.5 billion acquisition of American Broadcasting Companies. For Cap Cities, ABC is a major undertaking whose economics are likely to be unexciting over the next few years. This bothers us not an iota; we can be very patient. (No matter how great the talent or effort, some things just take time: you can't produce a baby in one month by getting nine women pregnant.)

As evidence of our confidence, we have executed an unusual agreement: for an extended period Tom, as CEO (or Dan, should he be CEO) votes our stock. This arrangement was initiated by Charlie and me, not by Tom. We also have restricted ourselves in various ways regarding sale of our shares. The object of these restrictions is to make sure that our block does not get sold to anyone who is a large holder (or intends to become a large holder) without the approval of management, an arrangement similar to ones we initiated some years ago at GEICO and Washington Post.

Since large blocks frequently command premium prices, some might think we have injured Berkshire financially by creating such restrictions. Our view is just the opposite. We feel the long-term economic prospects for these businesses-and, thus, for ourselves as owners-are enhanced by the arrangements. With them in place, the first-class managers with whom we have aligned ourselves can focus their efforts entirely upon running the businesses and maximizing long-term values for owners. Certainly this is much better than having those managers distracted by "revolving-door capitalists" hoping to put the company "in play." (Of course, some managers place their own interests above those of the company and its owners and deserve to be shaken up-but, in making investments, we try to steer clear of this type.)

Today, corporate instability is an inevitable consequence of widely-diffused ownership of voting stock. At any time a major holder can surface, usually mouthing reassuring rhetoric but frequently harboring uncivil intentions. By circumscribing our blocks of stock as we often do, we intend to promote stability where it otherwise might be lacking. That kind of certainty, combined with a good manager and a good business, provides excellent soil for a rich financial harvest. That's the economic case for our arrangements.

The human side is just as important. We don't want managers we like and admire-and who have welcomed a major financial commitment by us-to ever lose any sleep wondering whether surprises might occur because of our large ownership. I have told them there will be no surprises, and these agreements put Berkshire's signature where my mouth is. That signature also means the managers have a corporate commitment and therefore need not worry if my personal participation in Berkshire's affairs ends prematurely (a term I define as any age short of three digits).

Our Cap Cities purchase was made at a full price, reflecting the very considerable enthusiasm for both media stocks and media properties that has developed in recent years (and that, in the case of some property purchases, has approached a mania). It's no field for bargains. However, our Cap Cities investment allies us with an exceptional combination of properties and people-and we like the opportunity to participate in size.

Of course, some of you probably wonder why we are now buying Cap Cities at $172.50 per share given that your Chairman, in a characteristic burst of brilliance, sold Berkshire's holdings in the same company at $43 per share in 1978-80. Anticipating your question, I spent much of 1985 working on a snappy answer that would reconcile these acts.

A little more time, please.

E. *Intelligent Investing*[21]

Inactivity strikes us as intelligent behavior. Neither we nor most business managers would dream of feverishly trading highly-profitable subsidiaries because a small move in the Federal Reserve's discount rate was predicted or because some Wall Street pundit had reversed his views on the market. Why, then, should we behave differently with our minority positions in wonderful businesses? The art of investing in public companies successfully is little different from the art of successfully acquiring subsidiaries. In each case you simply want to acquire, at a sensible price, a business with excellent economics and able, honest management. Thereafter, you need only monitor whether these qualities are being preserved.

When carried out capably, an investment strategy of that type will often result in its practitioner owning a few securities that will come to represent a very large portion of his portfolio. This inves-

21 [1996.]

tor would get a similar result if he followed a policy of purchasing an interest in, say, 20% of the future earnings of a number of outstanding college basketball stars. A handful of these would go on to achieve NBA stardom, and the investor's take from them would soon dominate his royalty stream. To suggest that this investor should sell off portions of his most successful investments simply because they have come to dominate his portfolio is akin to suggesting that the Bulls trade Michael Jordan because he has become so important to the team.

In studying the investments we have made in both subsidiary companies and common stocks, you will see that we favor businesses and industries unlikely to experience major change. The reason for that is simple: Making either type of purchase, we are searching for operations that we believe are virtually certain to possess enormous competitive strength ten or twenty years from now. A fast-changing industry environment may offer the chance for huge wins, but it precludes the certainty we seek.

I should emphasize that, as citizens, Charlie and I welcome change: Fresh ideas, new products, innovative processes and the like cause our country's standard of living to rise, and that's clearly good. As investors, however, our reaction to a fermenting industry is much like our attitude toward space exploration: We applaud the endeavor but prefer to skip the ride.

Obviously all businesses change to some extent. Today, See's is different in many ways from what it was in 1972 when we bought it: It offers a different assortment of candy, employs different machinery and sells through different distribution channels. But the reasons why people today buy boxed chocolates, and why they buy them from us rather than from someone else, are virtually unchanged from what they were in the 1920's when the See family was building the business. Moreover, these motivations are not likely to change over the next 20 years, or even 50.

We look for similar predictability in marketable securities. Take Coca-Cola: The zeal and imagination with which Coke products are sold has burgeoned under Roberto Goizueta, who has done an absolutely incredible job in creating value for his shareholders. Aided by Don Keough and Doug Ivester, Roberto has rethought and improved every aspect of the company. But the fundamentals of the business-the qualities that underlie Coke's competitive dominance and stunning economics-have remained constant through the years.

I was recently studying the 1896 report of Coke (and you think that you are behind in your reading!). At that time Coke, though it was already the leading soft drink, had been around for only a decade. But its blueprint for the next 100 years was already drawn. Reporting sales of $148,000 that year, Asa Candler, the company's president, said: "We have not lagged in our efforts to go into all the world teaching that Coca-Cola is the article, par excellence, for the health and good feeling of all people.'; Though "health" may have been a reach, I love the fact that Coke still relies on Candler's basic theme today-a century later. Candler went on to say, just as Roberto could now, "No article of like character has ever so firmly entrenched itself in public favor." Sales of syrup that year, incidentally, were 116,492 gallons versus about 3.2 billion in 1996.

I can't resist one more Candler quote: "Beginning this year about March 1st ... we employed ten traveling salesmen by means of which, with systematic correspondence from the office, we covered almost the territory of the Union." That's my kind of sales force.

Companies such as Coca-Cola and Gillette might well be labeled "The Inevitables." Forecasters may differ a bit in their predictions of exactly how much soft drink or shaving-equipment business these companies will be doing in ten or twenty years. Nor is our talk of inevitability meant to play down the vital work that these companies must continue to carry out, in such areas as manufacturing, distribution, packaging and product innovation. In the end, however, no sensible observer-not even these companies' most vigorous competitors, assuming they are assessing the matter honestly-questions that Coke and Gillette will dominate their fields worldwide for an investment lifetime. Indeed, their dominance will probably strengthen. Both companies have significantly expanded their already huge shares of market during the past ten years, and all signs point to their repeating that performance in the next decade.

Obviously many companies in high-tech businesses or embryonic industries will grow much faster in percentage terms than will The Inevitables. But I would rather be certain of a good result than hopeful of a great one.

Of course, Charlie and I can identify only a few Inevitables, even after a lifetime of looking for them. Leadership alone provides no certainties: Witness the shocks some years back at General Motors, IBM and Sears, all of which had enjoyed long periods of seeming invincibility. Though some industries or lines of busi-

ness exhibit characteristics that endow leaders with virtually insurmountable advantages, and that tend to establish Survival of the Fattest as almost a natural law, most do not. Thus, for every Inevitable, there are dozens of Impostors, companies now riding high but vulnerable to competitive attacks. Considering what it takes to be an Inevitable, Charlie and I recognize that we will never be able to come up with a Nifty Fifty or even a 1\vinkling 1\venty. To the Inevitables in our portfolio, therefore, we add a few "Highly Probables."

You can, of course, pay too much for even the best of businesses. The overpayment risk surfaces periodically and, in our opinion, may now be quite high for the purchasers of virtually all stocks, The Inevitables included. Investors making purchases in an overheated market need to recognize that it may often take an extended period for the value of even an outstanding company to catch up with the price they paid.

A far more serious problem occurs when the management of a great company gets sidetracked and neglects its wonderful base business while purchasing other businesses that are so-so or worse. When that happens, the suffering of investors is often prolonged. Unfortunately, that is precisely what transpired years ago at both Coke and Gillette. (Would you believe that a few decades back they were growing shrimp at Coke and exploring for oil at Gillette?) Loss of focus is what most worries Charlie and me when we contemplate investing in businesses that in general look outstanding. All too often, we've seen value stagnate in the presence of hubris or of boredom that caused the attention of managers to wander. That's not going to happen again at Coke and Gillette, however-not given their current and prospective managements.

* * * * *

Let me add a few thoughts about your own investments. Most investors, both institutional and individual, will find that the best way to own common stocks is through an index fund that charges minimal fees. Those following this path are sure to beat the net results (after fees and expenses) delivered by the great majority of investment professionals.

Should you choose, however, to construct your own portfolio, there are a few thoughts worth remembering. Intelligent investing is not complex, though that is far from saying that it is easy. What an investor needs is the ability to correctly evaluate selected businesses. Note that word "selected": You don't have to be an expert

on every company, or even many. You only have to be able to evaluate companies within your circle of competence. The size of that circle is not very important; knowing its boundaries, however, is vital.

To invest successfully, you need not understand beta, efficient markets, modern portfolio theory, option pricing, or emerging markets. You may, in fact, be better off knowing nothing of these. That, of course, is not the prevailing view at most business schools, whose finance curriculum tends to be dominated by such subjects. In our view, though, investment students need only two well-taught courses-How to Value a Business, and How to Think About Market Prices.

Your goal as an investor should simply be to purchase, at a rational price, a part interest in an easily-understandable business whose earnings are virtually certain to be materially higher five, ten and twenty years from now. Over time, you will find only a few companies that meet these standards-so when you see one that qualifies, you should buy a meaningful amount of stock. You must also resist the temptation to stray from your guidelines: If you aren't willing to own a stock for ten years, don't even think about owning it for ten minutes. Put together a portfolio of companies whose aggregate earnings march upward over the years, and so also will the portfolio's market value.

Though it's seldom recognized, this is the exact approach that has produced gains for Berkshire shareholders: Our look-through earnings have grown at a good clip over the years, and our stock price has risen correspondingly. Had those gains in earnings not materialized, there would have been little increase in Berkshire's value.

F. *Cigar Butts and the Institutional Imperative*[22]

To quote Robert Benchley, "Having a dog teaches a boy fidelity, perseverance, and to turn around three times before lying down." Such are the shortcomings of experience. Nevertheless, it's a good idea to review past mistakes before committing new ones. So let's take a quick look at the last 25 years.

• My first mistake, of course, was in buying control of Berkshire. Though I knew its business-textile manufacturing-to be unpromising, I was enticed to buy because the price looked cheap. Stock purchases of that kind had proved reasonably rewarding in

22 [1989.]

my early years, though by the time Berkshire came along in 1965 I was becoming aware that the strategy was not ideaL

If you buy a stock at a sufficiently low price, there will usually be some hiccup in the fortunes of the business that gives you a chance to unload at a decent profit, even though the long-term performance of the business may be terrible. I call this the "cigar butt" approach to investing. A cigar butt found on the street that has only one puff left in it may not offer much of a smoke, but the "bargain purchase" will make that puff all profit.

Unless you are a liquidator, that kind of approach to buying businesses is foolish. First, the original "bargain" price probably will not turn out to be such a steal after all. In a difficult business, no sooner is one problem solved than another surfaces-never is there just one cockroach in the kitchen. Second, any initial advantage you secure will be quickly eroded by the low return that the business earns. For example, if you buy a business for $8 million that can be sold or liquidated for $10 million and promptly take either course, you can realize a high return. But the investment will disappoint if the business is sold for $10 million in ten years and in the interim has annually earned and distributed only a few percent on cost. Time is the friend of the wonderful business, the enemy of the mediocre.

You might think this principle is obvious, but I had to learn it the hard way-in fact, I had to learn it several times over. Shortly after purchasing Berkshire, I acquired a Baltimore department store, Hochschild, Kohn, buying through a company called Diversified Retailing that later merged with Berkshire. I bought at a substantial discount from book value, the people were first-class, and the deal included some extras-unrecorded real estate values and a significant LIFO inventory cushion. How could I miss? So-o-o-three years later I was lucky to sell the business for about what I had paid. After ending our corporate marriage to Hochschild, Kohn, I had memories like those of the husband in the country song, "My Wife Ran Away With My Best Friend and I Still Miss Him a Lot."

I could give you other personal examples of "bargain-purchase" folly but I'm sure you get the picture: It's far better to buy a wonderful company at a fair price than a fair company at a wonderful price. Charlie understood this early; I was a slow learner. But now, when buying companies or common stocks, we look for first-class businesses accompanied by first-class managements.

• That leads right into a related lesson: Good jockeys will do well on good horses, but not on broken-down nags. Both Berkshire's textile business and Hochschild, Kohn had able and honest people running them. The same managers employed in a business with good economic characteristics would have achieved fine records. But they were never going to make any progress while running in quicksand.[23]

I've said many times that when a management with a reputation for brilliance tackles a business with a reputation for bad economics, it is the reputation of the business that remains intact. I just wish I hadn't been so energetic in creating examples. My behavior has matched that admitted by Mae West: "I was Snow White, but I drifted."

• A further related lesson: Easy does it. After 25 years of buying and supervising a great variety of businesses, Charlie and I have *not* learned how to solve difficult business problems. What we have learned is to avoid them. To the extent we have been successful, it is because we concentrated on identifying one-foot hurdles that we could step over rather than because we acquired any ability to clear seven-footers.

The finding may seem unfair, but in both business and investments it is usually far more profitable to simply stick with the easy and obvious than it is to resolve the difficult. On occasion, tough problems *must* be tackled as was the case when we started our Sunday paper in Buffalo. In other instances, a great investment opportunity occurs when a marvelous business encounters a one-time huge, but solvable, problem as was the case many years back at both American Express and GEIeO. Overall, however, we've done better by avoiding dragons than by slaying them.

• My most surprising discovery: the overwhelming importance in business of an unseen force that we might call "the institutional imperative." In business school, I was given no hint of the imperative's existence and I did not intuitively understand it when I entered the business world. I thought then that decent, intelligent, and experienced managers would automatically make rational business decisions. But I learned over time that isn't so. Instead, rationality frequently wilts when the institutional imperative comes into play.

For example: (1) As if governed by Newton's First Law of Motion, an institution will resist any change in its current direction; (2)

---

23 [*See* the essay The Anxieties of Plant Closings in Part I.e.]

Just as work expands to fill available time, corporate projects or acquisitions will materialize to soak up available funds; (3) Any business craving of the leader, however foolish, will be quickly supported by detailed rate-of-return and strategic studies prepared by his troops; and (4) The behavior of peer companies, whether they are expanding, acquiring, setting executive compensation or whatever, will be mindlessly imitated.

Institutional dynamics, not venality or stupidity, set businesses on these courses, which are too often misguided. After making some expensive mistakes because I ignored the power of the imperative, I have tried to organize and manage Berkshire in ways that minimize its influence. Furthermore, Charlie and I have attempted to concentrate our investments in companies that appear alert to the problem.

• After some other mistakes, I learned to go into business only with people whom I like, trust, and admire. As I noted before, this policy of itself will not ensure success: A second-class textile or department-store company won't prosper simply because its managers are men that you would be pleased to see your daughter marry. However, an owner-or investor-can accomplish wonders if he manages to associate himself with such people in businesses that possess decent economic characteristics. Conversely, we do not wish to join with managers who lack admirable qualities, no matter how attractive the prospects of their business. We've never succeeded in making a good deal with a bad person.

• Some of my worst mistakes were not publicly visible. These were stock and business purchases whose virtues I understood and yet didn't make. It's no sin to miss a great opportunity outside one's area of competence. But I have passed on a couple of really big purchases that were served up to me on a platter and that I was fully capable of understanding. For Berkshire's shareholders, myself included, the cost of this thumb-sucking has been huge.

• Our consistently-conservative financial policies may appear to have been a mistake, but in my view were not. In retrospect, it is clear that significantly higher, though still conventional, leverage ratios at Berkshire would have produced considerably better returns on equity than the 23.8% we have actually averaged. Even in 1965, perhaps we could have judged there to be a 99% probability that higher leverage would lead to nothing but good. Correspondingly, we might have seen only a 1% chance that some shock factor, external or internal, would cause a conventional debt ratio to

produce a result falling somewhere between temporary anguish and default.

We wouldn't have liked those 99:1 odds-and never will. A small chance of distress or disgrace cannot, in our view, be offset by a large chance of extra returns. If your actions are sensible, you are certain to get good results; in most such cases, leverage just moves things along faster. Charlie and I have never been in a big hurry: We enjoy the process far more than the proceeds-though we have learned to live with those also.

G. *Junk Bonds*[24]

Lethargy bordering on sloth remains the cornerstone of our investment style: This year we neither bought nor sold a share of five of our six major holdings. The exception was Wells Fargo, a superbly-managed, high-return banking operation in which we increased our ownership to just under 10%, the most we can own without the approval of the Federal Reserve Board. About one-sixth of our position was bought in 1989, the rest in 1990.

The banking business is no favorite of ours. When assets are twenty times equity-a common ratio in this industry-mistakes that involve only a small portion of assets can destroy a major portion of equity. And mistakes have been the rule rather than the exception at many major banks. Most have resulted from a managerial failing that we described last year when discussing the "institutional imperative:" the tendency of executives to mindlessly imitate the behavior of their peers, no matter how foolish it may be to do so. In their lending, many bankers played follow-the-Ieader with lemming-like zeal; now they are experiencing a lemming-like fate.

Because leverage of 20:1 magnifies the effects of managerial strengths and weaknesses, we have no interest in purchasing shares of a poorly-managed bank at a "cheap" price. Instead, our only interest is in buying into well-managed banks at fair prices.

With Wells Fargo, we think we have obtained the best managers in the business, Carl Reichardt and Paul Hazen. In many ways the combination of Carl and Paul reminds me of another-Tom Murphy and Dan Burke at Capital Cities/ABC. First, each pair is stronger than the sum of its parts because each partner understands, trusts and admires the other. Second, both managerial

---

24 [Divided by hash lines: 1990; 1990 Wesco Financial Corporation Letter to Shareholders, by Charles T. Munger. Reprinted with permission.]

teams payable people well, but abhor having a bigger head count than is needed. Third, both attack costs as vigorously when profits are at record levels as when they are under pressure. Finally, both stick with what they understand and let their abilities, not their egos, determine what they attempt. (Thomas J. Watson Sr. of IBM followed the same rule: "I'm no genius," he said. "I'm smart in spots-but I stay around those spots.")

Our purchases of Wells Fargo in 1990 were helped by a chaotic market in bank stocks. The disarray was appropriate: Month by month the foolish loan decisions of once well-regarded banks were put on public display. As one huge loss after another was unveiled-often on the heels of managerial assurances that all was well-investors understandably concluded that no bank's numbers were to be trusted. Aided by their flight from bank stocks, we purchased our 10% interest in Wells Fargo for $290 million, less than five times after-tax earnings, and less than three times pre-tax earnings.

Wells Fargo is big-it has $56 billion in assets-and has been earning more than 20% on equity and 1.25% on assets. Our purchase of one-tenth of the bank may be thought of as roughly equivalent to our buying 100% of a $5 billion bank with identical financial characteristics. But were we to make such a purchase, we would have to pay about twice the $290 million we paid for Wells Fargo. Moreover, that $5 billion bank, commanding a premium price, would present us with another problem: We would not be able to find a Carl Reichardt to run it. In recent years, Wells Fargo executives have been more avidly recruited than any others in the banking business; no one however, has been able to hire the dean.

Of course, ownership of a bank-or about any other business-is far from riskless. California banks face the specific risk of a major earthquake, which might wreak enough havoc on borrowers to in turn destroy the banks lending to them. A second risk is systemic-the possibility of a business contraction or financial panic so severe that it would endanger almost every highly-leveraged institution, no matter how intelligently run. Finally, the market's major fear of the moment is that West Coast real estate values will tumble because of overbuilding and deliver huge losses to banks that have financed the expansion. Because it is a leading real estate lender, Wells Fargo is thought to be particularly vulnerable.

None of these eventualities can be ruled out. The probability of the first two occurring, however, is low and even a meaningful

drop in real estate values is unlikely to cause major problems for well-managed institutions. Consider some mathematics: Wells Fargo currently earns well over $1 billion pre-tax annually after expensing more than $300 million for loan losses. If 10% of all $48 billion of the bank's loans-not just its real estate loans-were hit by problems in 1991, and these produced losses (including foregone interest) averaging 30% of principal, the company would roughly break even.

A year like that-which we consider only a low-level possibility, not a likelihood-would not distress us. In fact, at Berkshire we would love to acquire businesses or invest in capital projects that produced no return for a year, but that could then be expected to earn 20% on growing equity. Nevertheless, fears of a California real estate disaster similar to that experienced in New England caused the price of Wells Fargo stock to fall almost 50% within a few months during 1990. Even though we had bought some shares at the prices prevailing before the fall, we welcomed the decline because it allowed us to pick up many more shares at the new, panic prices.

Investors who expect to be ongoing buyers of investments throughout their lifetimes should adopt a similar attitude toward market fluctuations; instead many illogically become euphoric when stock prices rise and unhappy when they fall. They show no such confusion in their reaction to food prices: Knowing they are forever going to be buyers of food, they welcome falling prices and deplore price increases. (It's the seller of food who doesn't like declining prices.) Similarly, at the Buffalo News we would cheer lower prices for newsprint-even though it would mean marking down the value of the large inventory of newsprint we always keep on hand-because we know we are going to be perpetually buying the product.

Identical reasoning guides our thinking about Berkshire's investments. We will be buying businesses-or small parts of businesses, called stocks-year in, year out as long as I live (and longer, if Berkshire's directors attend the seances I have scheduled). Given these intentions, declining prices for businesses benefit us, and rising prices hurt us.

The most common cause of low prices is pessimism-sometimes pervasive, sometimes specific to a company or industry. We *want* to do business in such an environment, not because we like pessimism but because we like the prices it produces. It's optimism that is the enemy of the rational buyer.

None of this means, however, that a business or stock is an intelligent purchase simply because it is unpopular; a contrarian approach is just as foolish as a follow-the-crowd strategy. What's required is thinking rather than polling. Unfortunately, Bertrand Russell's observation about life in general applies with unusual force in the financial world: "Most men would rather die than think. Many do."

* * * * *

Our other major portfolio change last year was large additions to our holdings of RJR Nabisco bonds, securities that we first bought in late 1989. At yearend 1990 we had $440 million invested in these securities, an amount that approximated market value. (As I write this, however, their market value has risen by more than $150 million.)

Just as buying into the banking business is unusual for us, so is the purchase of below-investment-grade bonds. But opportunities that interest us and that are also large enough to have a worthwhile impact on Berkshire's results are rare. Therefore, we will look at any category of investment, so long as we understand the business we're buying into and believe that price and value may differ significantly. (Woody Allen, in another context, pointed out the advantage of open-mindedness: "I can't understand why more people aren't bi-sexual because it doubles your chances for a date on Saturday night.")

In the past we have bought a few below-investment-grade bonds with success, though these were all old-fashioned "fallen angels"-bonds that were initially of investment grade but that were downgraded when the issuers fell on bad times. . . .

A kind of bastardized fallen angel burst onto the investment scene in the 1980s-"junk bonds" that were far below investment-grade when issued. As the decade progressed, new offerings of manufactured junk became ever junkier and ultimately the predictable outcome occurred: Junk bonds lived up to their name. In 1990-even before the recession dealt its blows-the financial sky became dark with the bodies of failing corporations.

The disciples of debt assured us that this collapse wouldn't happen: Huge debt, we were told, would cause operating managers to focus their efforts as never before, much as a dagger mounted on the steering wheel of a car could be expected to make its driver proceed with intensified care. We'll acknowledge that such an attention-getter would produce a very alert driver. But another cer-

tain consequence would be a deadly-and unnecessary-accident if the car hit even the tiniest pothole or sliver of ice. The roads of business are riddled with potholes; a plan that requires dodging them all is a plan for disaster.

In the final chapter of *The Intelligent Investor* Ben Graham forcefully rejected the dagger thesis: "Confronted with a challenge to distill the secret of sound investment into three words, we venture the motto, Margin of Safety." Forty-two years after reading that, I still think those are the right three words. The failure of investors to heed this simple message caused them staggering losses as the 1990s began.

At the height of the debt mania, capital structures were concocted that guaranteed failure: In some cases, so much debt was issued that even highly favorable business results could not produce the funds to service it. One particularly egregious "kill-'em-at-birth" case a few years back involved the purchase of a mature television station in Tampa, bought with so much debt that the interest on it exceeded the station's *gross revenues.* Even if you assume that all labor, programs and services were donated rather than purchased, this capital structure required revenues to explode-or else the station was doomed to go broke. (Many of the bonds that financed the purchase were sold to now-failed savings and loan associations; as a taxpayer, you are picking up the tab for this folly.)

All of this seems impossible now. When these misdeeds were done, however, dagger-selling investment bankers pointed to the "scholarly" research of academics, which reported that over the years the higher interest rates received from low-grade bonds had more than compensated for their higher rate of default. Thus, said the friendly salesmen, a diversified portfolio of junk bonds would produce greater net returns than would a portfolio of high~grade bonds. (Beware of past-performance "proofs" in finance: If history books were the key to riches, the Forbes 400 would consist of librarians.)

There was a flaw in the salesmen's logic-one that a first-year student in statistics is taught to recognize. An assumption was being made that the universe of newly-minted junk bonds was identical to the universe of low-grade fallen angels and that, therefore, the default experience of the latter group was meaningful in predicting the default experience of the new issues. (That was an error similar to checking the historical death rate from Kool-Aid before drinking the version served at Jonestown.)

The universes were of course dissimilar in several vital respects. For openers, the manager of a fallen angel almost invariably yearned to regain investment-grade status and worked toward that goal. The junk-bond operator was usually an entirely different breed. Behaving much as a heroin user might, he devoted his energies not to finding a cure for his debt-ridden condition, but rather to finding another fix. Additionally, the fiduciary sensitivities of the executives managing the typical fallen angel were often, though not always, more finely developed than were those of the junk-bond-issuing financiopath.

Wall Street cared little for such distinctions. As usual, the Street's enthusiasm for an idea was proportional not to its merit, but rather to the revenue it would produce. Mountains of junk bonds were sold by those who didn't care to those who didn't think-and there was no shortage of either.

Junk bonds remain a mine field, even at prices that today are often a small fraction of issue price. As we said last year, we have never bought a new issue of a junk bond. (The only time to buy these is on a day with no "y" in it.) We are, however, willing to look at the field, now that it is in disarray.

In the case of RJR Nabisco, we feel the Company's credit is considerably better than was generally perceived for a while and that the yield we receive, as well as the potential for capital gain, more than compensates for the risk we incur (though that is far from nil). RJR has made asset sales at favorable prices, has added major amounts of equity, and in general is being run well.

However, as we survey the field, most low-grade bonds still look unattractive. The handiwork of the Wall Street of the 1980s is even worse than we had thought: Many important businesses have been mortally wounded. We will, though, keep looking for opportunities as the junk market continues to unravel.

It is interesting to compare Wesco's approach (deliberate non-diversification of investments in an attempt to be more skillful per transaction) with an approach promoted for years by Michael Milken to help sell junk bonds. The Milken approach, supported by theories of many finance professors, argued that (1) market prices were efficient in a world where investors get paid extra for enduring volatility (wide swings in outcomes); (2) therefore, the prices at which new issues of junk bonds came to market were fair in a probabilistic sense (meaning that the high promised interest rates covered increased statistical expectancy of loss) and also pro-

vided some premium return to cover volatility exposure; and (3) therefore, if a savings and loan association (or other institution) arranged diversification, say, by buying, without much examination, a large part of each new Milken issue of junk bonds, the association would work itself into the sure to-get-better-than-average-results position of a gambling house proprietor with a "house" edge. This type of theorizing has now wreaked havoc at institutions, governed by true-believers, which backed their conclusions by buying Milken's "bonds." Contrary to the theorizing, widely diversified purchases of such "bonds" have in most cases produced dismal results. We can all understand why Milken behaved as he did and believed what he had to believe in order to maintain an endurable self-image. But how can we explain why anyone else believed that Milken was paid 5% commissions to put "bond" buyers in the position of the house in Las Vegas? We suggest this cause: many of the foolish buyers, and their advisers, were trained by finance professors who pushed beloved models (efficient market theory and modern portfolio theory) way too far, while they ignored other models that would have warned of danger. This is a common type of "expert" error ....

H. *Zero-Coupon Bonds*[25]

Berkshire issued $902.6 million principal amount of Zero-Coupon Convertible Subordinated Debentures, which are now listed on the New York Stock Exchange. Salomon Brothers handled the underwriting in superb fashion, providing us helpful advice and a flawless execution.

Most bonds, of course, require regular payments of interest, usually semi-annually. A zero-coupon bond, conversely, requires no current interest payments; instead, the investor receives his yield by purchasing the security at a significant discount from maturity value. The effective interest rate is determined by the original issue price, the maturity value, and the amount of time between issuance and maturity.

In our case, the bonds were issued at 44.314% of maturity value and are due in 15 years. For investors purchasing the bonds, that is the mathematical equivalent of a 5.5% current payment compounded semi-annually. Because we received only 44.31 cents on the dollar, our proceeds from this offering were $400 million (less about $9.5 million of offering expenses).

---

25 [1989.]

The bonds were issued in denominations of $10,000 and each bond is convertible into .4515 shares of Berkshire Hathaway. Because a $10,000 bond cost $4,431, this means that the conversion price was $9,815 per Berkshire share, a 15% premium to the market price then existing. Berkshire can call the bonds at any time after September 28, 1992 at their accreted value (the original issue price plus 5.5% compounded semi-annually) and on two specified days, September 28 of 1994 and 1999, the bondholders can require Berkshire to buy the securities at their accreted value.

For tax purposes, Berkshire is entitled to deduct the 5.5% interest accrual each year, even though we make no payments to the bondholders. Thus the net effect to us, resulting from the reduced taxes, is positive cash flow. That is a very significant benefit. Some unknowable variables prevent us from calculating our exact effective rate of interest, but under all circumstances it will be well below 5.5%. There is meanwhile a symmetry to the tax law: Any taxable holder of the bonds must pay tax each year on the 5.5% interest, even though he receives no cash.

Neither our bonds nor those of certain other companies that issued similar bonds last year (notably Loews and Motorola) resemble the great bulk of zero-coupon bonds that have been issued in recent years. Of these, Charlie and I have been, and will continue to be, outspoken critics. As I will later explain, such bonds have often been used in the most deceptive of ways and with deadly consequences to investors. But before we tackle that subject, let's travel back to Eden, to a time when the apple had not yet been bitten.

If you're my age you bought your first zero-coupon bonds during World War II, by purchasing the famous Series E U.S. Savings Bond, the most widely-sold bond issue in history. (After the war, these bonds were held by one out of two U.S. households.) Nobody, of course, called the Series E a zero-coupon bond, a term in fact that I doubt had been invented. But that's precisely what the Series E was.

These bonds came in denominations as small as $18.75. That amount purchased a $25 obligation of the United States government due in 10 years, terms that gave the buyer a compounded annual return of 2.9%. At the time, this was an attractive offer: the 2.9% rate was higher than that generally available on Government bonds and the holder faced no market-fluctuation risk, since he could at any time cash in his bonds with only a minor reduction in interest.

A second form of zero-coupon *V.S.* Treasury issue, also benign and useful, surfaced in the last decade. One problem with a normal bond is that even though it pays a given interest rate-say lO%-the holder cannot be assured that a compounded 10% return will be realized. For that rate to materialize, each semi-annual coupon must be reinvested at 10% as it is received. If current interest rates are, say, only 6% or 7% when these coupons come due, the holder will be unable to compound his money over the life of the bond at the advertised rate. For pension funds or other investors with long-term liabilities, "reinvestment risk" of this type can be a serious problem. Savings Bonds might have solved it, except that they are issued only to individuals and are unavailable in large denominations. What big buyers needed was huge quantities of "Savings Bond Equivalents."

Enter some ingenious and, in this case, highly useful investment bankers (led, I'm happy to say, by Salomon Brothers). They created the instrument desired by "stripping" the semi-annual coupons from standard Government issues. Each coupon, once detached, takes on the essential character of a Savings Bond since it represents a single sum due sometime in the future. For example, if you strip the 40 semi-annual coupons from a V.S. Government Bond due in the year 2010, you will have 40 zero-coupon bonds, with maturities from six months to 20 years, each of which can then be bundled with other coupons of like maturity and marketed. If current interest rates are, say, 10% for all maturities, the six-month issue will sell for 95.24% of maturity value and the 20-year issue will sell for 14.20%. The purchaser of any given maturity is thus guaranteed a compounded rate of 10% for his entire holding period. Stripping of government bonds has occurred on a large scale in recent years, as long-term investors, ranging from pension funds to individual IRA accounts, recognized these high-grade, zero-coupon issues to be well suited to their needs.

But as happens in Wall Street all too often, what the wise do in the beginning, fools do in the end. In the last few years zero-coupon bonds (and their functional equivalent, pay-in-kind bonds, which distribute additional PIK bonds semi-annually as interest instead of paying cash) have been issued in enormous quantities by ever-junkier credits. To these issuers, zero (or PIK) bonds offer one overwhelming advantage: It is impossible to default on a promise to pay nothing. Indeed, if LDC governments had issued no debt in the 1970's other than long-term zero-coupon obligations, they would now have a spotless record as debtors.

This principle at work-that you need not default for a long time if you solemnly promise to pay nothing for a long time-has not been lost on promoters and investment bankers seeking to finance ever-shakier deals. But its acceptance by lenders took a while: When the leverage buy-out craze began some years back, purchasers could borrow only on a reasonably sound basis, in which conservatively-estimated free cash flow-that is, operating earnings plus depreciation and amortization less normalized capital expenditures-was adequate to cover both interest and modest reductions in debt.

Later, as the adrenalin of deal-makers surged, businesses began to be purchased at prices so high that all free cash flow necessarily had to be allocated to the payment of interest. That left nothing for the paydown of debt. In effect, a Scarlett O'Hara "I'll think about it tomorrow" position in respect to principal payments was taken by borrowers and accepted by a new breed of lender, the buyer of original-issue junk bonds. Debt now became something to be refinanced rather than repaid. The change brings to mind a New Yorker cartoon in which the grateful borrower rises to shake the hand of the bank's lending officer and gushes: "I don't know how I'll ever repay you."

Soon borrowers found even the new, lax standards intolerably binding. To induce lenders to finance even sillier transactions, they introduced an abomination, EBDIT-Earnings Before Depreciation, Interest and Taxes-as the test of a company's ability to pay interest. Using this sawed-off yardstick, the borrower ignored depreciation as an expense on the theory that it did not require a current cash outlay.

Such an attitude is clearly delusional. At 95% of American businesses, capital expenditures that over time roughly approximate depreciation are a necessity and are every bit as real an expense as labor or utility costs. Even a high school dropout knows that to finance a car he must have income that covers not only interest and operating expenses, but also realistically-calculated depreciation. He would be laughed out of the bank if he started talking about EBDIT.

Capital outlays at a business can be skipped, of course, in any given month, just as a human can skip a day or even a week of eating. But if the skipping becomes routine and is not made up, the body weakens and eventually dies. Furthermore, a start and-stop feeding policy will over time produce a less healthy organism, human or corporate, than that produced by a steady diet. As busi-

nessmen, Charlie and I relish having competitors who are unable to fund capital expenditures.

You might think that waving away a major expense such as depreciation in an attempt to make a terrible deal look like a good one hits the limits of Wall Street's ingenuity. If so, you haven't been paying attention during the past few years. Promoters needed to find a way to justify even pricier acquisitions. Otherwise, they risked-heaven forbid-losing deals to other promoters with more "imagination."

So, stepping through the Looking Glass, promoters and their investment bankers proclaimed that EBDIT should now be measured against cash interest only, which meant that interest accruing on zero-coupon or PIK bonds could be ignored when the financial feasibility of a transaction was being assessed. This approach not only relegated depreciation expense to the let's-ignore-it corner, but gave similar treatment to what was usually a significant portion of interest expense. To their shame, many professional investment managers went along with this nonsense, though they usually were careful to do so only with clients' money, not their own. (Calling these managers "professionals" is actually too kind; they should be designated "promotees.")

Under this new standard, a business earning, say, $100 million pre-tax and having debt on which $90 million of interest must be paid currently, might use a zero-coupon of PIK issue to incur another $60 million of annual interest that would accrue and compound but not come due for some years. The rate on these issues would typically be very high, which means that the situation in year 2 might be $90 million cash interest plus $69 million accrued interest, and so on as the compounding proceeds. Such high-rate reborrowing schemes, which a few years ago were appropriately confined to the waterfront, soon became models of finance at virtually all major investment banking houses.

When they make these offerings, investment bankers display their humorous side: They dispense income and balance sheet projections extending five or more years into the future for companies they barely had heard of a few months earlier. If you are shown such schedules, I suggest that you join the fun: Ask the investment banker for the one-year budgets that his own firm prepared as the last few years began and then compare these with what actually happened.

Some time ago Ken Galbraith, in his witty and insightful *The Great Crash,* coined a new economic term: "the bezzle," defined as

the current amount of undiscovered embezzlement. This financial creature has a magical quality: The embezzlers are richer by the amount of the bezzle, while the embezzlers do not yet feel poorer.

Professor Galbraith astutely pointed out that this sum should be added to the National Wealth so that we might know the Psychic National Wealth. Logically, a society that wanted to feel enormously prosperous would both encourage its citizens to embezzle and try not to detect the crime. By this means, "wealth" would balloon though not an erg of productive work had been done.

The satirical nonsense of the bezzle is dwarfed by the real-world nonsense of the zero-coupon bond. With zeros, one party to a contract can experience "income" without his opposite experiencing the pain of expenditure. In our illustration, a company capable of earning only $100 million dollars annually-and therefore capable of paying only that much in interest-magically creates "earnings" for bondholders of $150 million. As long as major investors willingly don their Peter Pan wings and repeatedly say "I believe," there is no limit to how much "income" can be created by the zero-coupon bond.

Wall Street welcomed this invention with the enthusiasm less-enlightened folk might reserve for the wheel or the plow. Here, finally, was an instrument that would let the Street make deals at prices no longer limited by actual earning power. The result, obviously, would be more transactions: Silly prices will always attract sellers. And, as Jesse Unruh might have put it, transactions are the mother's milk of finance.

The zero-coupon or PIK bond possesses an additional attraction for the promoter and investment banker, which is that the time elapsing between folly and failure can be stretched out. This is no small benefit. If the period before all costs must be faced is long, promoters can create a string of foolish deals-and take in lots of fees-before any chickens come home to roost from their earlier ventures.

But in the end, alchemy, whether it is metallurgical or financial, fails. A base business can not be transformed into a golden business by tricks of accounting or capital structure. The man claiming to be a financial alchemist may become rich. But gullible investors rather than business achievements will usually be the source of his wealth.

Whatever their weaknesses, we should add, many zero-coupon and PIK bonds will not default. We have in fact owned some and

may buy more if their market becomes sufficiently distressed. (We've not, however, even considered buying a new issue from a weak credit.) No financial instrument is evil per se; it's just that some variations have far more potential for mischief than others.

The blue ribbon for mischief-making should go to the zero-coupon issuer unable to make its interest payments on a current basis. Our advice: Whenever an investment banker starts talking about EBDIT-or whenever someone creates a capital structure that does not allow all interest, both payable and accrued, to be comfortably met out of current cash flow net of ample capital expenditures-zip up your wallet. Turn the tables by suggesting that the promoter and his high-priced entourage accept zero-coupon fees, deferring their take until the zero-coupon bonds have been paid in full. See then how much enthusiasm for the deal endures.

Our comments about investment bankers may seem harsh. But Charlie and I-in our hopelessly old-fashioned way-believe that they should perform a gatekeeping role, guarding investors against the promoter's propensity to indulge in excess. Promoters, after all, have throughout time exercised the same judgment and restraint in accepting money that alcoholics have exercised in accepting liquor. At a minimum, therefore, the banker's conduct should rise to that of a responsible bartender who, when necessary, refuses the profit from the next drink to avoid sending a drunk out on the highway. In recent years, unfortunately, many leading investment firms have found bartender morality to be an intolerably restrictive standard. Lately, those who have traveled the high road in Wall Street have not encountered heavy traffic.

One distressing footnote: The cost of the zero-coupon folly will not be borne solely by the direct participants. Certain savings and loan associations were heavy buyers of such bonds, using cash that came from FSLIC-insured deposits. Straining to show splendid earnings, these buyers recorded-but did not receive-ultra-high interest income on these issues. Many of these associations are now in major trouble. Had their loans to shaky credits worked, the owners of the associations would have pocketed the profits. In the many cases in which the loans will fail, the taxpayer will pick up the bill. To paraphrase Jackie Mason, at these associations it was the managers who should have been wearing the ski masks.

I. Preferred Stock[26]

We only want to link up with people whom we like, admire, and trust. John Gutfreund at Salomon, Colman Mockler, Jr. at Gillette, Ed Colodny at USAir, and Andy Sigler at Champion meet this test in spades.

They in turn have demonstrated some confidence in us, insisting in each case that our preferreds have unrestricted voting rights on a fully-converted basis, an arrangement that is far from standard in corporate finance. In effect they are trusting us to be intelligent owners, thinking about tomorrow *instead* of today, just as we are trusting them to be intelligent managers, thinking about tomorrow *as well* as today.

The preferred-stock structures we have negotiated will provide a mediocre return for us if industry economics hinder the performance of our investees, but will produce reasonably attractive results for us if they can earn a return comparable to that of American industry in general. We believe that Gillette, under Colman's management, will far exceed that return and believe that John, Ed, and Andy will reach it unless industry conditions are harsh.

Under almost any conditions, we expect these preferreds to return us our money plus dividends. If that is all we get, though, the result will be disappointing, because we will have given up flexibility and consequently will have missed some significant opportunities that are bound to present themselves during the decade. Under that scenario, we will have obtained only a preferred-stock yield during a period when the typical preferred stock will have held no appeal for us whatsoever. The only way Berkshire can achieve satisfactory results from its four preferred issues is to have the common stocks of the investee companies do well.

Good management and at least tolerable industry conditions will be needed if that is to happen. But we believe Berkshire's investment will also help and that the other shareholders of each investee will profit over the years ahead from our preferred-stock purchase. The help will come from the fact that each company now has a major, stable, and interested shareholder whose Chairman and Vice Chairman have, through Berkshire's investments, indirectly committed a very large amount of their own money to these undertakings. In dealing with our investees, Charlie and I will be supportive, analytical, and objective. We recognize that we are working with experienced CEOs who are very much in command

---

26 [Divided by hash lines: 1989; 1994; 1996; 1990; 1995.]

of their own business but who nevertheless, at certain moments, appreciate the chance to test their thinking on someone without ties to their industry or to decisions of the past.

As a group, these convertible preferreds will not produce the returns we can achieve when we find a business with wonderful economic prospects that is unappreciated by the market. Nor will the returns be as attractive as those produced when we make our favorite form of capital deployment, the acquisition of 80% or more of a fine business with a fine management. But both opportunities are rare, particularly in a size befitting our present and anticipated resources.

In summation, Charlie and I feel that our preferred stock investments should produce returns moderately above those achieved by most fixed-income portfolios and that we can play a minor but enjoyable and constructive role in the investee companies.

Mistakes occur at the time of decision. We can only make our mistake-du-jour award, however, when the foolishness of a decision becomes obvious. By this measure, 1994 was a vintage year with keen competition for the gold medal. Here, I would like to tell you that the mistakes I will describe originated with Charlie. But whenever I try to explain things that way, my nose begins to grow.

And the nominees are ...

Late in 1993 I sold 10 million shares of Cap Cities at $63; at year-end 1994, the price was $85¼. (The difference is $222.5 million for those of you who wish to avoid the pain of calculating the damage yourself.) When we purchased the stock at $17.25 in 1986, I told you that I had previously sold our Cap Cities holdings at $4.30 per share during 1978-80, and added that I was at a loss to explain my earlier behavior. Now I've become a repeat offender. Maybe it's time to get a guardian appointed.

Egregious as it is, the Cap Cities decision earns only a silver medal. Top honors go to a mistake I made five years ago that fully ripened in 1994: Our $358 million purchase of USAir preferred stock, on which the dividend was suspended in September. . . . [T]his deal [w]as an "unforced error," meaning that I was neither pushed into the investment nor misled by anyone when making it. Rather, this was a case of sloppy analysis, a lapse that may have been caused by the fact that we were buying a senior security or by hubris. Whatever the reason, the mistake was large.

Before this purchase, I simply failed to focus on the problems that would inevitably beset a carrier whose costs were both high and extremely difficult to lower. In earlier years, these life-threatening costs posed few problems. Airlines were then protected from competition by regulation, and carriers could absorb high costs because they could pass them along by way of fares that were also high.

When deregulation came along, it did not immediately change the picture: The capacity of low-cost carriers was so small that the high-cost lines could, in large part, maintain their existing fare structures. During this period, with the longer-term problems largely invisible but slowly metastasizing, the costs that were non-sustainable became further embedded.

As the seat capacity of the low-cost operators expanded, their fares began to force the old-line, high-cost airlines to cut their own. The day of reckoning for these airlines could be delayed by infusions of capital (such as ours into USAir), but eventually a fundamental rule of economics prevailed: In an unregulated commodity business, a company must lower its costs to competitive levels or face extinction. This principle should have been obvious to your Chairman, but I missed it.

Seth Schofield, [then] CEO of USAir, has worked diligently to correct the company's historical cost problems but, to date, has not managed to do so. In part, this is because he has had to deal with a moving target, the result of certain major carriers having obtained labor concessions and other carriers having benefitted from "fresh-start" costs that came out of bankruptcy proceedings. (As Herb Kelleher, CEO of Southwest Airlines, has said: "Bankruptcy court for airlines has become a health spa.") Additionally, it should be no surprise to anyone that those airline employees who contractually receive above-market salaries will resist any reduction in these as long as their checks continue to clear.

Despite this difficult situation, USAir may yet achieve the cost reductions it needs to maintain its viability long-term. But it is far from sure that will happen.

Accordingly, we wrote our USAir investment down to $89.5 million, or 25¢ on the dollar, at yearend 1994. This valuation reflects both a possibility that our preferred will have its value fully or largely restored and an opposite possibility that the stock will eventually become worthless. Whatever the outcome, we will heed a prime rule of investing: You don't have to make it back the way that you lost it.

The accounting effects of our USAir writedown are complicated. On our balance sheet, we carryall stocks at estimated market value. Therefore, at the end of last year's third quarter, we were carrying our USAir preferred at $89.5 million, or 25% of cost. In other words, our net worth was at that time reflecting a value for USAir that was far below our $358 million cost.

But in the fourth quarter, we concluded that the decline in value was, in accounting terms, "other than temporary," and that judgment required us to send the writedown of $268.5 million through our income statement. The amount had no other fourth-quarter effect. That is, it did not reduce our net worth, because the diminution of value had already been reflected there.

Charlie and I will not stand for reelection to USAir's board at the upcoming annual meeting. Should Seth wish to consult with us, however, we will be pleased to be of any help that we can.

When Richard Branson, the wealthy owner of Virgin Atlantic Airways, was asked how to become a millionaire, he had a quick answer: "There's really nothing to it. Start as a billionaire and then buy an airline." Unwilling to accept Branson's proposition on faith, your Chairman decided in 1989 to test it by investing $358 million in a 9¼% preferred stock of USAir.

I liked and admired Ed Colodny, the company's then-CEO, and I still do. But my analysis of USAir's business was both superficial and wrong. I was so beguiled by the company's long history of profitable operations, and by the protection that ownership of a senior security seemingly offered me, that I overlooked the crucial point: USAir's revenues would increasingly feel the effects of an unregulated, fiercely competitive market whereas its cost structure was a holdover from the days when regulation protected profits. These costs, if left unchecked, portended disaster, however reassuring the airline's past record might be. ([Again, if] history supplied all of the answers, the Forbes 400 would consist of librarians.)

To rationalize its costs, however, USAir needed major improvements in its labor contracts-and that's something most airlines have found it extraordinarily difficult to get, short of credibly threatening, or actually entering, bankruptcy. USAir was to be no exception. Immediately after we purchased our preferred stock, the imbalance between the company's costs and revenues began to grow explosively. In the 1990-1994 period, USAir lost an aggregate of $2.4 billion, a performance that totally wiped out the book equity of its common stock.

For much of this period, the company paid us our preferred dividends, but in 1994 payment was suspended. A bit later, with the situation looking particularly gloomy, we wrote down our investment by 75%, to $89.5 million. Thereafter, during much of 1995, I offered to sell our shares at 50% of face value. Fortunately, I was unsuccessful.

Mixed in with my many mistakes at USAir was one thing I got right: Making our investment, we wrote into the preferred contract a somewhat unusual provision stipulating that "penalty dividends"-to run five percentage points over the prime rate-would be accrued on any arrearages. This meant that when our 9¼% dividend was omitted for two years, the unpaid amounts compounded at rates ranging between 13¼% and 14%.

Facing this penalty provision, USAir had every incentive to pay arrearages just as promptly as it could. And in the second half of 1996, when USAir turned profitable, it indeed began to pay, giving us $47.9 million. We owe Stephen Wolf, the company's CEO, a huge thank-you for extracting a performance from the airline that permitted this payment. Even so, USAir's performance has recently been helped significantly by an industry tailwind that may be cyclical in nature. The company still has basic cost problems that must be solved.

In any event, the prices of USAir's publicly-traded securities tell us that our preferred stock is now probably worth its par value of $358 million, give or take a little. In addition, we have over the years collected an aggregate of $240.5 million in dividends (including $30 million received in 1997).

Early in 1996, before any accrued dividends had been paid, I tried once more to unload our holdings-this time for about $335 million. You're lucky: I again failed in my attempt to snatch defeat from the jaws of victory.

In another context, a friend once asked me: "If you're so rich, why aren't you smart?" After reviewing my sorry performance with USAir, you may conclude he had a point.

We continue to hold the convertible preferred stocks described in earlier reports: $700 million of Salomon Inc., $600 million of The Gillette Company, $358 million of USAir Group, Inc., and $300 million of Champion International Corp. Our Gillette holdings will be converted into 12 million shares of common stock on April 1. Weighing interest rates, credit quality and prices of the related common stocks, we can assess our holdings in Salomon and

Champion at yearend 1990 as worth about what we paid, Gillette as worth somewhat more, and USAir as worth substantially less.

In making the USAir purchase, your Chairman displayed exquisite timing: I plunged into the business at almost the exact moment that it ran into severe problems. (No one pushed me; in tennis parlance, I committed an "unforced error.") The company's troubles were brought on both by industry conditions and by the post-merger difficulties it encountered in integrating Piedmont, an affliction I should have expected since almost all airline mergers have been followed by operational turmoil.

In short order, Ed Colodny and Seth Schofield resolved the second problem: The airline now gets excellent marks for service. Industry-wide problems have proved to be far more serious. Since our purchase, the economics of the airline industry have deteriorated at an alarming pace, accelerated by the kamikaze pricing tactics of certain carriers. The trouble this pricing has produced for all carriers illustrates an important truth: In a business selling a commodity-type product, it's impossible to be a lot smarter than your dumbest competitor.

However, unless the industry is decimated during the next few years, our USAir investment should work out all right. Ed and Seth decisively addressed the current turbulence by making major changes in operations. Even so, our investment is now less secure than at the time I made it.

Our convertible preferred stocks are relatively simple securities, yet I should warn you that, if the past is any guide, you may from time to time read inaccurate or misleading statements about them. Last year, for example, several members of the press calculated the value of all our preferreds as equal to that of the common stock into which they are convertible. By their logic, that is, our Salomon preferred, convertible into common at $38, would be worth 60% of face value if Salomon common were selling at $22.80. But there is a small problem with this line of reasoning: Using it, one must conclude that all of a value of a convertible preferred resides in the conversion privilege and that value of a non-convertible preferred of Salomon would be zero, no matter what its coupon or terms for redemption.

The point you should keep in mind is that most of the value of our convertible preferreds is derived from their fixed-income characteristics. That means the securities cannot be worth less than the value they would possess as non-convertible preferreds and may be worth more because of their conversion options.

Berkshire made five private purchases of convertible preferred stocks during the 1987-91 period and the time seems right to discuss their status.

In each case we had the option of sticking with these preferreds as fixed-income securities or converting them into common stock. Initially, their value to us came primarily from their fixed-income characteristics. The option we had to convert was a kicker.

Our $300 million private purchase of American Express "Peres" . . . was a modified form of common stock whose fixed-income characteristics contributed only a minor portion of its initial value. Three years after we bought them, the Peres automatically were converted to common stock. In contrast, [our other convertible preferred stocks] were set to become common stocks only if we wished them to-a crucial difference.

When we purchased our convertible securities, I told you that we expected to earn after-tax returns from them that "moderately" exceeded what we could earn from the medium-term fixed-income securities they replaced. We beat this expectation-but only because of the performance of a single issue. I also told you that these securities, as a group, would "not produce the returns we can achieve when we find a business with wonderful economic prospects." Unfortunately, that prediction was fulfilled. Finally, I said that "under almost any conditions, we expect these preferreds to return us our money plus dividends." That's one I would like to have back. Winston Churchill once said that "eating my words has never given me indigestion." My assertion, however, that it was almost impossible for us to lose money on our preferreds has caused me some well-deserved heartburn.

Our best holding has been Gillette, which we told you from the start was a superior business. Ironically, though, this is also the purchase in which I made my biggest mistake-of a kind, however, never recognized on financial statements.

We paid $600 million in 1989 for Gillette preferred shares that were convertible into 48 million (split-adjusted) common shares. Taking an alternative route with the $600 million, I probably could have purchased 60 million shares of common from the company. The market on the common was then about $10.50, and given that this would have been a huge private placement carrying important restrictions, I probably could have bought the stock at a discount of at least 5%. I can't be sure about this, but it's likely that Gillette's

management would have been just as happy to have Berkshire opt for common.

But I was far too clever to do that. Instead, for less than two years, we received some extra dividend income (the difference between the preferred's yield and that of the common), at which point the company-quite properly-called the issue, moving to do that as quickly as was possible. If I had negotiated for common rather than preferred, we would have been better off at yearend 1995 by $625 million, minus the "excess" dividends of about $70 million.

In the case of Champion, the ability of the company to call our preferred at 115% of cost forced a move out of us last August that we would rather have delayed. In this instance, we converted our shares just prior to the pending call and offered them to the company at a modest discount.

Charlie and I have never had a conviction about the paper industry-actually, I can't remember ever owning the common stock of a paper producer in my 54 years of investing-so our choice in August was whether to sell in the market or to the company... , Our Champion capital gain was moderate-about 19% after tax from a six-year investment-but the preferred delivered us a good after-tax dividend yield throughout our holding period. (That said, many press accounts have overstated the after-tax yields earned by property-casualty insurance companies on dividends paid to them. What the press has failed to take into account is a change in the tax law that took effect in 1987 and that significantly reduced the dividends received credit applicable to insurers. For details, see [Part V.H.].)

Our First Empire preferred [was to] be called on March 31, 1996, the earliest date allowable. We are comfortable owning stock in well-run banks, and we will convert and keep our First Empire common shares. Bob Wilmers, CEO of the company, is an outstanding banker, and we love being associated with him.

Our other two preferreds have been disappointing, though the Salomon preferred has modestly outperformed the fixed-income securities for which it was a substitute. However, the amount of management time Charlie and I have devoted to this holding has been vastly greater than its economic significance to Berkshire. Certainly I never dreamed I would take a new job at age 60-Salomon interim chairman, that is-because of an earlier purchase of a fixed-income security.

Soon after our purchase of the Salomon preferred in 1987, I wrote that I had "no special insights regarding the direction or future profitability of investment banking." Even the most charitable commentator would conclude that I have since proved my point.

To date, our option to convert into Salomon common has not proven of value. Furthermore, the Dow Industrials have doubled since I committed to buy the preferred, and the brokerage group has performed equally as well. That means my decision to go with Salomon because I saw value in the conversion option must be graded as very poor. Even so, the preferred has continued under some trying conditions to deliver as a fixed-income security, and the 9% dividend is currently quite attractive.

Unless the preferred is converted, its terms require redemption of 20% of the issue on October 31 of each year, 1995-99, and $140 million of our original $700 million was taken on schedule last year. (Some press reports labeled this a sale, but a senior security that matures is not "sold.") Though we did not elect to convert the preferred that matured last year, we have four more bites at the conversion apple, and I believe it quite likely that we will yet find value in our right to convert.

III. COMMON STOCK

[O]ccasional outbreaks of those two super-contagious diseases, fear and greed, will forever occur in the investment community. The timing of these epidemics will be unpredictable. And the market aberrations produced by them will be equally unpredictable, both as to duration and degree. Therefore, we never try to anticipate the arrival or departure of either disease. Our goal is more modest: we simply attempt to be fearful when others are greedy and to be greedy only when others are fearful.

As this is written, little fear is visible in Wall Street. Instead, euphoria prevails-and why not? What could be more exhilarating than to participate in a bull market in which the rewards to owners of businesses become gloriously uncoupled from the plodding performances of the businesses themselves. Unfortunately, however, stocks can't outperform businesses indefinitely.

Indeed, because of the heavy transaction and investment management costs they bear, stockholders as a whole and over the long term must inevitably underperform the companies they own. If American business, in aggregate, earns about 12% on equity annually, investors must end up earning significantly less. Bull markets can obscure mathematical laws, but they cannot repeal them.[27]

A. *The Bane of Trading: Transaction Costs*[28]

It is likely that in a few months Berkshire shares will be traded on the New York Stock Exchange. Our move there would be made possible by a new listing rule that the Exchange's Board of Governors has passed and asked the SEC to approve. If that approval is forthcoming, we expect to apply for a listing, which we believe will be granted.

Up to now, the Exchange has required newly-listed companies to have a minimum of 2,000 shareholders who each own 100 shares or more. The purpose of this rule is to insure that NYSE-listed companies enjoy the broad investor interest that facilitates an orderly market. The 100-share standard corresponds to the trading unit ("round lot") for all common stocks now listed on the Exchange.

Because [in 1988] Berkshire ha[d] relatively few shares outstanding (1,146,642), it [did] not have the number of 100-shares-or-more holders that the Exchange has required. A ten-share holding

---

27 [Introductory paragraph, 1986.]

28 [Letter dated August 5, 1988 sent to Berkshire shareholders and reprinted 1988.]

of Berkshire, however, represents a significant investment commitment. In fact, ten Berkshire shares have a value greater than that of 100 shares of any NYSE-listed stock. The Exchange, therefore, is willing to have Berkshire shares trade in *ten-share* "round lots."

The Exchange's proposed rule simply changes the 2,000 shareholder minimum from one measured by holders of 100 shares or more to one measured by holders of a round lot or more. Berkshire can easily meet this amended test.

Charlie Munger, Berkshire's Vice Chairman, and I are delighted at the prospect of listing, since we believe this move will benefit our shareholders. We have two criteria by which we judge what marketplace would be best for Berkshire stock. First, we hope for the stock to consistently trade at a price rationally related to its intrinsic business value. If it does, the investment result achieved by each shareholder will approximate Berkshire's business result during his period of ownership.

Such an outcome is far from automatic. Many stocks swing between levels of severe undervaluation and overvaluation. When this happens, owners are rewarded or penalized in a manner wildly at variance with how the business has performed during their period of ownership. We want to avoid such capricious results. Our goal is to have our shareholder-partners profit from the achievements of the business rather than from the foolish behavior of their co-owners.

Consistently rational prices are produced by rational owners, both current and prospective. All of our policies and communications are designed to attract the business-oriented long-term owner and to filter out possible buyers whose focus is short-term and market-oriented. To date we have been successful in this attempt, and Berkshire shares have consistently sold in an unusually narrow range around intrinsic business value. We do not believe that a NYSE listing will improve or diminish Berkshire's prospects for consistently selling at an appropriate price; the quality of our shareholders will produce a good result whatever the marketplace.

But we do believe that the listing will reduce transaction costs for Berkshire's shareholders-and that is important. Though we want to attract shareholders who will stay around for a long time, we also want to minimize the costs incurred by shareholders when they enter or exit. In the long run, the aggregate pre-tax rewards to our owners will equal the business gains achieved by the company less the transaction costs imposed by the marketplace-that is, commissions charged by brokers plus the net realized spreads of

market-makers. Overall, we believe these transaction costs will be reduced materially by a NYSE listing.

. . . [T]ransaction costs are very heavy for active stocks, often mounting to 10% or more of the earnings of a public company. In effect, these costs act as a hefty tax on owners, albeit one based on individual decisions to "change chairs" and one that is paid to the financial community rather than to Washington. Our policies and your investment attitude have reduced this "tax" on Berkshire owners to what we believe is the lowest level among large public companies. A NYSE listing should further reduce this cost for Berkshire's owners by narrowing the market-maker's spread.

Under NYSE rules we must have at least two independent directors. Among the Board of Directors you elected in May, only Malcolm Chace, JI. meets their test of independence.

But from this deficiency comes a good result. Charlie and I are pleased to inform you that Walter Scott, Jr., CEO of the Peter Kiewit Sons', Inc. has joined the Berkshire board. PKS is one of the remarkable business stories of our time. The company, which is employee-owned, has a long-term financial record so good that I'm not going to recite it for fear of stirring unrest among our shareholders. Throughout his lifetime, Pete Kiewit ran the company as a strict meritocracy and it was in this tradition that he picked Walter to succeed him upon his death. Walter instinctively thinks like an owner and he will feel at home on the Berkshire board.

One final comment: *You should clearly understand that we are not seeking a NYSE listing for the purpose of achieving a higher valuation on Berkshire shares. Berkshire should sell, and we hope will sell, on the NYSE at prices similar to those it would have commanded in the over-the-counter market, given similar economic circumstances.* The NYSE listing should not induce you to buy or sell; it simply should cut your costs somewhat should you decide to do either.

B. *Attracting the Right Sort of Investor*[29]

Berkshire's shares were listed on the [NYSE] on November 29, 1988.... Let me clarify one point not dealt with in the letter [set forth above]: Though our round lot for trading on the NYSE is ten shares, any number of shares from one on up can be bought or sold.

---

29 [1988.]

As the [foregoing] letter explains, our primary goal in listing was to reduce transaction costs, and we believe this goal is being achieved. Generally, the spread between the bid and asked price on the NYSE has been well below the spread that prevailed in the over-the-counter market.

Henderson Brothers, Inc., the specialist in our shares, is the oldest continuing specialist firm on the Exchange; its progenitor, William Thomas Henderson, bought his seat for $500 on September 8, 1861. (Recently, seats were selling for about $625,000.) Among the 54 firms acting as specialists, HBI ranks second in number of stocks assigned, with 83. We were pleased when Berkshire was allocated to HBI, and have been delighted with the firm's performance. Jim Maguire, Chairman of HBI, personally manages the trading in Berkshire, and we could not be in better hands.

In two respects our goals probably differ somewhat from those of most listed companies. First, we do not want to maximize the price at which Berkshire shares trade. We wish instead for them to trade in a narrow range centered at intrinsic business value (which we hope increases at a reasonable-or, better yet, unreasonable-rate). Charlie and I are bothered as much by significant overvaluation as significant undervaluation. Both extremes will inevitably produce results for many shareholders that will differ sharply from Berkshire's business results. If our stock price instead consistently mirrors business value, each of our shareholders will receive an investment result that roughly parallels the business results of Berkshire during his holding period.

Second, we wish for very little trading activity. If we ran a private business with a few passive partners, we would be disappointed if those partners, and their replacements, frequently wanted to leave the partnership. Running a public company, we feel the same way.

Our goal is to attract long-term owners who, at the time of purchase, have no timetable or price target for sale but plan instead to stay with us indefinitely. We don't understand the CEO who wants lots of stock activity, for that can be achieved only if many of his owners are constantly exiting. At what other organization-school, club, church, etc.-do leaders cheer when members leave? (However if there were a broker whose livelihood depended upon the membership turnover in such organizations, you could be sure that there would be at least one proponent of activity, as in: "There hasn't been much going on in Christianity for a while; maybe we should switch to Buddhism next week.")

Of course, some Berkshire owners will need or want to sell from time to time, and we wish for good replacements who will pay them a fair price. Therefore we try, through our policies, performance, and communications, to attract new shareholders who understand our operations, share our time horizons, and measure us as we measure ourselves. If we can continue to attract this sort of shareholder-and, just as important, can continue to be uninteresting to those with short-term or unrealistic expectations-Berkshire shares should consistently sell at prices reasonably related to business value.[30]

C. *Dividend Policy*[31]

Dividend policy is often reported to shareholders, but seldom explained. A company will say something like, "Our goal is to pay out 40% to 50% of earnings and to increase dividends at a rate at least equal to the rise in the CPI". And that's it-no analysis will be supplied as to why that particular policy is best for the owners of the business. Yet, allocation of capital is crucial to business and investment management. Because it is, we believe managers and owners should think hard about the circumstances under which earnings should be retained and under which they should be distributed.

The first point to understand is that all earnings are not created equal. In many businesses-particularly those that have high asset/profit ratios-inflation causes some or all of the reported earnings to become ersatz. The ersatz portion-let's call these earnings "restricted"-cannot, if the business is to retain its economic position, be distributed as dividends. Were these earnings to be paid out, the business would lose ground in one or more of the following areas: its ability to maintain its unit volume of sales, its long-term competitive position, its financial strength. No matter how conservative its payout ratio, a company that consistently dis-

30 [The following is from 1989:]

With more than a year behind him of trading Berkshire's stock on the New York Stock Exchange, our specialist, Jim Maguire of [RBI] continues his outstanding performance. Before we listed, dealer spreads often were 3% or more of market price. Jim has maintained the spread at 50 points or less, which at current prices is well under 1%. hareholders who buy or sell benefit significantly from this reduction in transaction costs.

Because we are delighted by our experience with Jim, RBI and the NYSE, I said as much in ads that have been run in a series placed by the NYSE. Normally I shun testimonials, but I was pleased in this instance to publicly compliment the Exchange.

31 [1984.]

tributes restricted earnings is destined for oblivion unless equity capital is otherwise infused.

Restricted earnings are seldom valueless to owners, but they often must be discounted heavily. In effect, they are conscripted by the business, no matter how poor its economic potential. (This retention-no-matter-how-unattractive-the-return situation was communicated unwittingly in a marvelously ironic way by Consolidated Edison a decade ago. At the time, a punitive regulatory policy was a major factor causing the company's stock to sell as low as one-fourth of book value: i.e., every time a dollar of earnings was retained for reinvestment in the business, that dollar was transformed into only 25¢ of market value. But, despite this gold-into-lead process, most earnings were reinvested in the business rather than paid to owners. Meanwhile, at construction and maintenance sites throughout New York, signs proudly proclaimed the corporate slogan, "Dig We Must".)

Restricted earnings need not concern us further in this dividend discussion. Let's turn to the much-more-valued unrestricted variety. These earnings may, with equal feasibility, be retained or distributed. In our opinion, management should choose whichever course makes greater sense for the owners of the business.

This principle is not universally accepted. For a number of reasons managers like to withhold unrestricted, readily distributable earnings from shareholders-to expand the corporate empire over which the managers rule, to operate from a position of exceptional financial comfort, etc. But we believe there is only one valid reason for retention. Unrestricted earnings should be retained only when there is a reasonable prospect-backed preferably by historical evidence or, when appropriate, by a thoughtful analysis of the future-that *for every dollar retained by the corporation, at least one dollar of market value will be created for owners.* This will happen only if the capital retained produces incremental earnings equal to, or above, those generally available to investors.

To illustrate, let's assume that an investor owns a risk-free 10% perpetual bond with one very unusual feature. Each year the investor can elect either to take his 10% coupon in cash, or to reinvest the coupon in more 10% bonds with identical terms: i.e., a perpetual life and coupons offering the same cash-or-reinvest options. If, in any given year, the prevailing interest rate on long-term, risk-free bonds is 5%, it would be foolish for the investor to take his coupon in cash since the 10% bonds he could instead choose would be worth considerably more than 100¢ on the dollar.

Under these circumstances, the investor wanting to get his hands on cash should take his coupon in additional bonds and then immediately sell them. By doing that, he would realize more cash than if he had taken his coupon directly in cash. Assuming all bonds were held by rational investors, no one would opt for cash in an era of 5% interest, not even those bondholders needing cash for living purposes.

If, however, interest rates were 15%, no rational investor would want his money invested for him at 10%. Instead, the investor would choose to take his coupon in cash, even if his personal cash needs were nil. The opposite course-reinvestment of the coupon-would give an investor additional bonds with market value far less than the cash he could have elected. If he should want 10% bonds, he can simply take the cash received and buy them in the market, where they will be available at a large discount.

An analysis similar to that made by our hypothetical bondholder is appropriate for owners in thinking about whether a company's unrestricted earnings should be retained or paid out. Of course, the analysis is much more difficult and subject to error because the rate earned on reinvested earnings is not a contractual figure, as in our bond case, but rather a fluctuating figure. Owners must guess as to what the rate will average over the intermediate future. However, once an informed guess is made, the rest of the analysis is simple: you should wish your earnings to be reinvested if they can be expected to earn high returns, and you should wish them paid to you if low returns are the likely outcome of reinvestment.

Many corporate managers reason very much along these lines in determining whether subsidiaries should distribute earnings to their parent company. At that level, the managers have no trouble thinking like intelligent owners. But payout decisions at the parent company level often are a different story. Here managers frequently have trouble putting themselves in the shoes of their shareholder-owners.

With this schizoid approach, the CEO of a multi-divisional company will instruct Subsidiary A, whose earnings on incremental capital may be expected to average 5%, to distribute all available earnings in order that they may be invested in Subsidiary B, whose earnings on incremental capital are expected to be 15%. The CEO's business school oath will allow no lesser behavior. But if his own long-term record with incremental capital is 5%-and

market rates are 10%-he is likely to impose a dividend policy on shareholders of the parent company that merely follows some historical or industry-wide payout pattern. Furthermore, he will expect managers of subsidiaries to give him a full account as to why it makes sense for earnings to be retained in their operations rather than distributed to the parent-owner. But seldom will he supply *his* owners with a similar analysis pertaining to the whole company.

In judging whether managers should retain earnings, shareholders should not simply compare total incremental earnings in recent years to total incremental capital because that relationship may be distorted by what is going on in a core business. During an inflationary period, companies with a core business characterized by extraordinary economics can use small amounts of incremental capital in that business at very high rates of return (as was discussed in last year's section on Goodwill).32 But, unless they are experiencing tremendous unit growth, outstanding businesses by definition generate large amounts of excess cash. If a company sinks most of this money in other businesses that earn low returns, the company's overall return on retained capital may nevertheless appear excellent because of the extraordinary returns being earned by the portion of earnings incremental invested in the core business. The situation is analogous to a Pro-Am golf event: even if all of the amateurs are hopeless duffers, the team's best-ball score will be respectable because of the dominating skills of the professional.

Many corporations that consistently show good returns both on equity and on overall incremental capital have, indeed, employed a large portion of their retained earnings on an economically unattractive, even disastrous, basis. Their marvelous core businesses, however, whose earnings grow year after year, camouflage repeated failures in capital allocation elsewhere (usually involving high-priced acquisition of businesses that have inherently mediocre economics). The managers at fault periodically report on the lesson they have learned from the latest disappointment. They then usually seek out future lessons. (Failure seems to go to their heads.)

In such cases, shareholders would be far better off if earnings were retained only to expand the high-return business, with the balance paid in dividends or used to repurchase stock (an action that increases the owners' interest in the exceptional business while sparing them participation in subpar businesses). Managers of

---

32 [*See* the essay Economic Goodwill Versus Accounting Goodwill in Part V.c.]

high-return businesses who consistently employ much of the cash thrown off by those businesses in other ventures with low returns should be held to account for those allocation decisions, regardless of how profitable the overall enterprise is.

Nothing in this discussion is intended to argue for dividends that bounce around from quarter to quarter with each wiggle in earnings or in investment opportunities. Shareholders of public corporations understandably prefer that dividends be consistent and predictable. Payments, therefore, should reflect long-term expectations for both earnings and returns on incremental capital. Since the long-term corporate outlook changes only infrequently, dividend patterns should change no more often. But over time distributable earnings that have been withheld by managers should earn their keep. If earnings have been unwisely retained, it is likely that managers, too, have been unwisely retained.

D. *Stock Splits and Trading Activity?>3*

We often are asked why Berkshire does not split its stock. The assumption behind this question usually appears to be that a split would be a pro-shareholder action. We disagree. Let me tell you why.

One of our goals is to have Berkshire Hathaway stock sell at a price rationally related to its intrinsic business value. (But note "rationally related," not "identical": if well-regarded companies are generally selling in the market at large discounts from value, Berkshire might well be priced similarly.) The key to a rational stock price is rational shareholders, both current and prospective.

If the holders of a company's stock and/or the prospective buyers attracted to it are prone to make irrational or emotion-based decisions, some pretty silly stock prices are going to appear periodically. Manic-depressive personalities produce manic-depressive valuations. Such aberrations may help us in buying and selling the stocks of other companies. But we think it is in both your interest and ours to minimize their occurrence in the market for Berkshire.

To obtain only high quality shareholders is no cinch. Mrs. Astor could select her 400, but anyone can buy any stock. Entering members of a shareholder "club" cannot be screened for intellectual capacity, emotional stability, moral sensitivity or acceptable

---

33 [1983.]

dress. Shareholder eugenics, therefore, might appear to be a hopeless undertaking.

In large part, however, we feel that high quality ownership can be attracted and maintained if we consistently communicate our business and ownership *philosophy-along with no other conflicting messages-and* then let self selection follow its course. For example, self selection will draw a far different crowd to a musical event advertised as an opera than one advertised as a rock concert-even though anyone can buy a ticket to either.

Through our policies and communications-our "advertisements"-we try to attract investors who will understand our operations, attitudes and expectations. (And, fully as important, we try to dissuade those who won't.) We want those who think of themselves as business owners and invest in companies with the intention of staying a long time. And, we want those who keep their eyes focused on business results, not market prices.

Investors possessing those characteristics are in a small minority, but we have an exceptional collection of them. I believe well over 90%-probably over 95%-of our shares are held by those who were shareholders of Berkshire or Blue Chip five years ago. And I would guess that over 95% of our shares are held by investors for whom the holding is at least double the size of their next largest. Among companies with at least several thousand public shareholders and more than $1 billion of market value, we are almost certainly the leader in the degree to which our shareholders think and act like owners. Upgrading a shareholder group that possesses these characteristics is not easy.

Were we to split the stock or take other actions focusing on stock price rather than business value, we would attract an entering class of buyers inferior to the exiting class of sellers. At $1300, there are very few investors who can't afford a Berkshire share. Would a potential one-share purchaser be better off if we split 100 for 1 so he could buy 100 shares? Those who think so and who would buy the stock because of the split or in anticipation of one would definitely downgrade the quality of our present shareholder group. (Could we really improve our shareholder group by trading some of our present dear-thinking members for impressionable new ones who, preferring paper to value, feel wealthier with nine $10 bills than with one $100 bill?) People who buy for non-value reasons are likely to sell for non-value reasons. Their presence in the picture will accentuate erratic price swings unrelated to underlying business developments.

We will try to avoid policies that attract buyers with a short-term focus on our stock price and try to allow policies that attract informed long-term investors focusing on business values. Just as you purchased your Berkshire shares in a market populated by rational informed investors, you deserve a chance to sell-should you ever want to-in the same kind of market. We will work to keep it in existence.

One of the ironies of the stock market is the emphasis on activity. Brokers, using terms such as "marketability" and "liquidity", sing the praises of companies with high share turnover (those who cannot fill your pocket will confidently fill your ear). But investors should understand that what is good for the croupier is not good for the customer. A hyperactive stock market is the pickpocket of enterprise.

For example, consider a typical company earning, say, 12% on equity. Assume a very high turnover rate in its shares of 100% per year. If a purchase and sale of the stock trades at book value, the owners of our hypothetical company will pay, in aggregate, 2% of the company's net worth annually for the privilege of transferring ownership. This activity does nothing for the earnings of the business, and means that 1/6 of them are lost to the owners through the "frictional" cost of transfer. (And this calculation does not count option trading, which would increase frictional costs still further.)

All that makes for a rather expensive game of musical chairs. Can you imagine the agonized cry that would arise if a governmental unit were to impose a new *1623%* tax on earnings of corporations or investors? By market activity, investors can impose upon themselves the equivalent of such a tax.

Days when the market trades 100 million shares (and that kind of volume, when over-the-counter trading is included, is today abnormally low) are a curse for owners, not a blessing-for they mean that owners are paying twice as much to change chairs as they are on a SO-million-share day. If 100-million-share days persist for a year and the average cost on each purchase and sale is 1S¢ a share, the chair-changing tax for investors in aggregate would total about $7.5 billion-an amount roughly equal to the combined 1982 profits of Exxon, General Motors, Mobil and Texaco, the four largest companies in the Fortune 500.

These companies had a combined net worth of $75 billion at yearend 1982 and accounted for over 12% of both net worth and net income of the entire Fortune 500 list. Under our assumption investors, in aggregate, every year forfeit all earnings from this

staggering sum of capital merely to satisfy their penchant for "financial flip-flopping". In addition, investment management fees of over $2 billion annually-sums paid for chair-changing advice-require the forfeiture by investors of all earnings of the five largest banking organizations (Citicorp, Bank America, Chase Manhattan, Manufacturers Hanover and J.P. Morgan). These expensive activities may decide who eats the pie, but they don't enlarge it.

(We are aware of the pie-expanding argument that says that such activities improve the rationality of the capital allocation process. We think that this argument is specious and that, on balance, hyperactive equity markets subvert rational capital allocation and act as pie shrinkers. Adam Smith felt that all noncollusive acts in a free market were guided by an invisible hand that led an economy to maximum progress; our view is that casino-type markets and hair-trigger investment management act as an invisible foot that trips up and slows down a forward-moving economy.)

Contrast the hyperactive stock with Berkshire. The bid-and-ask spread in our stock currently is about 30 points, or a little over 2%. Depending on the size of the transaction, the difference between proceeds received by the seller of Berkshire and cost to the buyer may range downward from 4% (trading involving only a few shares) to perhaps 1½% (in large trades where negotiation can reduce both the market-maker's spread and the broker's commission). Because most Berkshire shares are traded in fairly large transactions, the spread on all trading probably does not average more than 2%.

Meanwhile, true turnover in Berkshire stock (excluding inter-dealer transactions, gifts and bequests) probably runs 3% per year. Thus our owners, in aggregate, are paying perhaps *6/100* of 1% of Berkshire's market value annually for transfer privileges. By this very rough estimate, that's $900,000-not a small cost, but far less than average. Splitting the stock would increase that cost, downgrade the quality of our shareholder population, and encourage a market price less consistently related to intrinsic business value. We see no offsetting advantages.

E. *Shareholder Strategies*[34]

Late last year Berkshire's stock price crossed $10,000. Several shareholders have mentioned to me that the high price causes them problems: They like to give shares away each year and find them-

34 [1992.]

selves impeded by the tax rule that draws a distinction between annual gifts of $10,000 or under to a single individual and those above $10,000. That is, those gifts no greater than $10,000 are completely tax-free; those above $10,000 require the donor to use up a portion of his or her lifetime exemption from gift and estate taxes, or, if that exemption has been exhausted, to pay gift taxes.

I can suggest three ways to address this problem. The first would be useful to a married shareholder, who can give up to $20,000 annually to a single recipient, as long as the donor files a gift tax return containing his or her spouse's written consent to gifts made during the year.

Secondly, a shareholder, married or not, can make a bargain sale. Imagine, for example, that Berkshire is selling for $12,000 and that one wishes to make only a $10,000 gift. In that case, sell the stock to the giftee for $2,000. (Caution: You will be taxed on the amount, if any, by which the sales price to your giftee exceeds your tax basis.)

Finally, you can establish a partnership with people to whom you are making gifts, fund it with Berkshire shares, and simply give percentage interests in the partnership away each year. These interests can be for any value that you select. If the value is $10,000 or less, the gift will be tax-free.

We issue the customary warning: Consult with your own tax advisor before taking action on any of the more esoteric methods of gift-making.

We hold to the view about stock splits that we set forth in the 1983 Annual Report.[35] Overall, we believe our owner-related policies-including the no-split policy-have helped us assemble a body of shareholders that is the best associated with any widely-held American corporation. Our shareholders think and behave like rational long-term owners and view the business much as Charlie and I do. Consequently, our stock consistently trades in a price range that is sensibly related to intrinsic value.

Additionally, we believe that our shares turn over far less actively than do the shares of any other widely-held company. The frictional costs of trading-which act as a major "tax" on the owners of many companies-are virtually non-existent at Berkshire. (The market-making skills of Jim Maguire, our New York Stock Exchange specialist, definitely help to keep these costs low.) Obviously a split would not change this situation dramatically. None-

35 *[See* the essay Stock Splits and Trading Activity in Part iII.D.]

theless, there is no way that our shareholder group would be upgraded by the new shareholders enticed by a split. Instead we believe that modest degradation would occur.

F. *Berkshire's Recapitalization*[36]

At the Annual Meeting you will be asked to approve a recapitalization of Berkshire, creating two classes of stock. If the plan is adopted, our existing common stock will be designated as Class A Common Stock and a new Class B Common Stock will be authorized.

Each share of the "B" will have the rights of 1I30th of an "A" share with these exceptions: First, a B share will have 1I200th of the vote of an A share (rather than 1I30th of the vote). Second, the B will not be eligible to participate in Berkshire's shareholder-designated charitable contributions program.

When the recapitalization is complete, each share of A will become convertible, at the holder's option and at any time, into 30 shares of B. This conversion privilege will not extend in the opposite direction. That is, holders of B shares will not be able to convert them into A shares.

We expect to list the B shares on the New York Stock Exchange, where they will trade alongside the A stock. To create the shareholder base necessary for a listing-and to ensure a liquid market in the B stock-Berkshire expects to make a public offering for cash of at least $100 million of new B shares. The offering will be made only by means of a prospectus.

The market will ultimately determine the price of the B shares. Their price, though, should be in the neighborhood of 1I30th of the price of the A shares.

Class A shareholders who wish to give gifts may find it convenient to convert a share or two of their stock into Class B shares. Additionally, arbitrage-related conversions will occur if demand for the B is strong enough to push its price to slightly above 1I30th of the price of A.

However, because the Class A stock will entitle its holders to full voting rights and access to Berkshire's contributions program, these shares will be superior to the Class B shares and we would expect most shareholders to remain holders of the Class A-which is precisely what the Buffett and Munger families plan to do, except in those instances when we ourselves might convert a few

---

36 [Divided by hash lines: 1995; 1996.]

shares to facilitate gifts. The prospect that most shareholders will stick to the A stock suggests that it will enjoy a somewhat more liquid market than the B.

There are tradeoffs for Berkshire in this recapitalization. But they do not arise from the proceeds of the offering-we will find constructive uses for the money-nor in any degree from the price at which we will sell the B shares. As I write this-with Berkshire stock at $36,000-Charlie and I do not believe it undervalued. Therefore, the offering we propose will not diminish the per-share intrinsic value of our existing stock. Let me also put our thoughts about valuation more baldly: Berkshire is selling at a price at which Charlie and I would not consider buying it.

What Berkshire will incur by way of the B stock are certain added costs, including those involving the mechanics of handling a larger number of shareholders. On the other hand, the stock should be a convenience for people wishing to make gifts. And those of you who have hoped for a split have gained a do-it-yourself method of bringing one about.

We are making this move, though, for other reasons-having to do with the appearance of expense-laden unit trusts purporting to be low-priced "clones" of Berkshire and sure to be aggressively marketed. The idea behind these vehicles is not new: In recent years, a number of people have told me about their wish to create an "all-Berkshire" investment fund to be sold at a low dollar price. But until recently, the promoters of these investments heard out my objections and backed off.

I did not discourage these people because I prefer large investors over small. Were it possible, Charlie and I would love to turn $1,000 into $3,000 for multitudes of people who would find that gain an important answer to their immediate problems.

In order to quickly triple small stakes, however, we would have to just as quickly turn our present market capitalization of $43 billion into $129 billion (roughly the market cap of General Electric, America's most highly valued company). *We can't come close to doing that.* The very best we hope for is-on average-to double Berkshire's per-share intrinsic value every five years, and we may well fall far short of that goal.

In the end, Charlie and I do not care whether our shareholders own Berkshire in large or small amounts. What we wish for are shareholders of any size who are knowledgeable about our operations, share our objectives and long-term perspective, and are

aware of our limitations, most particularly those imposed by our large capital base.

The unit trusts that have recently surfaced fly in the face of these goals. They would be sold by brokers working for big commissions, would impose other burdensome costs on their shareholders, and would be marketed *en masse* to unsophisticated buyers, apt to be seduced by our past record and beguiled by the publicity Berkshire and I have received in recent years. The sure outcome: a multitude of investors destined to be disappointed.

Through our creation of the B stock-a low-denomination product far superior to Berkshire-only trusts-we hope to make the clones unmerchandisable.

But both present and prospective Berkshire shareholders should pay special attention to one point: Though the per-share intrinsic value of our stock has grown at an excellent rate during the past five years, its market price has grown still faster. The stock, in other words, has outperformed the business.

That kind of market overperformance cannot persist indefinitely, neither for Berkshire nor any other stock. *Inevitably, there will be periods of underperformance as well.* The price volatility that results, though endemic to public markets, is not to our liking. What we would prefer instead is to have the market price of Berkshire precisely track its intrinsic value. Were the stock to do that, every shareholder would benefit during his period of ownership in exact proportion to the progress Berkshire itself made in the period.

Obviously, the market behavior of Berkshire's stock will never conform to this ideal. But we will come closer to this goal than we would otherwise if our present and prospective shareholders are informed, business-oriented and not exposed to high-commission salesmanship when making their investment decisions. To that end, we are better off if we can blunt the merchandising efforts of the unit trust-and that is the reason we are creating the B stock.

[W]e made two good-sized offerings through Salomon [during 1996], both with interesting aspects. The first was our sale in May of 517,500 shares of Class B Common, which generated net proceeds of $565 million. As I have told you before, we made this sale in response to the threatened creation of unit trusts that would have marketed themselves as Berkshire look-alikes. In the process, they would have used our past, and definitely nonrepeatable,

record to entice naive small investors and would have charged these innocents high fees and commissions.

I think it would have been quite easy for such trusts to have sold many billions of dollars worth of units, and I also believe that early marketing successes by these trusts would have led to the formation of others. (In the securities business, whatever can be sold will be sold.) The trusts would have meanwhile indiscriminately poured the proceeds of their offerings into a supply of Berkshire shares that is fixed and limited. The likely result: a speculative bubble in our stock. For at least a time, the price jump would have been self-validating, in that it would have pulled new waves of naive and impressionable investors into the trusts and set off still more buying of Berkshire shares.

Some Berkshire shareholders choosing to exit might have found that outcome ideal, since they could have profited at the expense of the buyers entering with false hopes. Continuing shareholders, however, would have suffered once reality set in, for at that point Berkshire would have been burdened with both hundreds of thousands of unhappy, indirect owners (trustholders, that is) and a stained reputation.

Our issuance of the B shares not only arrested the sale of the trusts, but provided a low-cost way for people to invest in Berkshire if they still wished to after hearing the warnings we issued. To blunt the enthusiasm that brokers normally have for pushing new issues-because that's where the money is-we arranged for our offering to carry a commission of only *1¼%,* the lowest payoff that we have ever seen in common stock underwriting. Additionally, we made the amount of the offering open-ended, thereby repelling the typical IPO buyer who looks for a short-term price spurt arising from a combination of hype and scarcity.

Overall, we tried to make sure that the B stock would be purchased only by investors with a long-term perspective. Those efforts were generally successful: Trading volume in the B shares immediately following the offering-a rough index of "flipping"-was far below the norm for a new issue. In the end we added about 40,000 shareholders, most of whom we believe both understand what they own and share our time horizons.

Salomon could not have performed better in the handling of this unusual transaction. Its investment bankers understood perfectly what we were trying to achieve and tailored every aspect of the offering to meet these objectives. The firm would have made far more money-perhaps ten times as much-if our offering had

been standard in its make-up. But the investment bankers involved made no attempt to tweak the specifics in that direction. Instead they came up with ideas that were counter to Salomon's financial interest but that made it much more certain Berkshire's goals would be reached. Terry Fitzgerald captained this effort, and we thank him for the job that he did.

Given that background, it won't surprise you to learn that we again went to Terry when we decided late in the year to sell an issue of Berkshire notes that can be exchanged for a portion of the Salomon shares that we hold. In this instance, once again, Salomon did an absolutely first-class job, selling $500 million principal amount of five-year notes for $447.1 million. Each $1,000 note is exchangeable into 17.65 shares and is callable in three years at accreted value. Counting the original issue discount and a 1% coupon, the securities will provide a yield of 3% to maturity for holders who do not exchange them for Salomon stock. But it seems quite likely that the notes will be exchanged before their maturity. If that happens, our interest cost will be about 1.1% for the period prior to exchange.

In recent years, it has been written that Charlie and I are unhappy about all investment-banking fees. That's dead wrong. We have paid a great many fees over the last 30 years-beginning with the check we wrote to Charlie Heider upon our purchase of National Indemnity in 1967-and we are delighted to make payments that are commensurate with performance. In the case of the 1996 transactions at Salomon Brothers we more than got our money's worth.

IV. MERGERS AND ACQUISITIONS

Of all our activities at Berkshire, the most exhilarating for Charlie and me is the acquisition of a business with excellent economic characteristics and a management that we like, trust and admire. Such acquisitions are not easy to make but we look for them constantly. In the search, we adopt the same attitude one might find appropriate in looking for a spouse: It pays to be active, interested, and open-minded, but it does not pay to be in a hurry.

In the past, I've observed that many acquisition-hungry managers were apparently mesmerized by their childhood reading of the story about the frog-kissing princess. Remembering her success, they pay dearly for the right to kiss corporate toads, expecting wondrous transfigurations. Initially, disappointing results only deepen their desire to round up new toads. ("Fanaticism," said [Santayana], "consists of redoubling your effort when you've forgotten your aim.") Ultimately, even the most optimistic manager must face reality. Standing knee-deep in unresponsive toads, he then announces an enormous "restructuring" charge. In this corporate equivalent of a Head Start program, the CEO receives the education but the stockholders pay the tuition.

In my early days as a manager I, too, dated a few toads. They were cheap dates-I've never been much of a sport-but my results matched those of acquirers who courted higher-priced toads. I kissed and they croaked.

After several failures of this type, I finally remembered some useful advice I once got from a golf pro (who, like all pros who have had anything to do with my game, wishes to remain anonymous). Said the pro: "Practice doesn't make perfect; practice makes permanent." And thereafter I revised my strategy and tried to buy good businesses at fair prices rather than fair businesses at good prices.[37]

A. *Bad Motives and High Prices*[38]

As our history indicates, we are comfortable both with total ownership of businesses and with marketable securities representing small portions of businesses. We continually look for ways to employ large sums in each area. (But we try to avoid small commitments-"If something's not worth doing at all, it's not worth doing well".) Indeed, the liquidity requirements of our insurance

37 [Introductory essay, 1992.]

38 [Divided by hash lines: 1981; 1982; 1994.]

and trading stamp businesses mandate major investments in marketable securities.

Our acquisition decisions will be aimed at maximizing real economic benefits, not at maximizing either managerial domain or reported numbers for accounting purposes. (In the long run, managements stressing accounting appearance over economic substance usually achieve little of either.)

Regardless of the impact upon immediately reportable earnings, we would rather buy 10% of Wonderful Business T at X per share than 100% of Tat 2X per share. Most corporate managers prefer just the reverse, and have no shortage of stated rationales for their behavior.

However, we suspect three motivations-usually unspoken-to be, singly or in combination, the important ones in most high-premium takeovers:

(1) Leaders, business or otherwise, seldom are deficient in animal spirits and often relish increased activity and challenge. At Berkshire, the corporate pulse never beats faster than when an acquisition is in prospect.

(2) Most organizations, business or otherwise, measure themselves, are measured by others, and compensate their managers far more by the yardstick of size than by any other yardstick. (Ask a *Fortune 500* manager where his corporation stands on that famous list and, invariably, the number responded will be from the list ranked by size of sales; he may well not even know where his corporation places on the list *Fortune* just as faithfully compiles ranking the same 500 corporations by profitability.)

(3) Many managements apparently were overexposed in impressionable childhood years to the story in which the imprisoned handsome prince is released from a toad's body by a kiss from a beautiful princess. Consequently, they are certain their managerial kiss will do wonders for the profitability of Company T(arget).

Such optimism is essentiaL Absent that rosy view, why else should the shareholders of Company A(cquisitor) want to own an interest in T at the 2X takeover cost rather than at the X market price they would pay if they made direct purchases on their own?

In other words, investors can always buy toads at the going price for toads. If investors instead bankroll princesses who wish to pay double for the right to kiss the toad, those kisses had better pack some real dynamite. We've observed many kisses but very

few miracles. Nevertheless, many managerial princesses remain serenely confident about the future potency of their kisses-even after their corporate backyards are knee-deep in unresponsive toads. In fairness, we should acknowledge that some acquisition records have been dazzling. Two major categories stand out.

The first involves companies that, through design or accident, have purchased only businesses that are particularly well adapted to an inflationary environment. Such favored business must have two characteristics: (1) an ability to increase prices rather easily (even when product demand is flat and capacity is not fully utilized) without fear of significant loss of either market share or unit volume, and (2) an ability to accommodate large dollar volume increases in business (often produced more by inflation than by real growth) with only minor additional investment of capital. Managers of ordinary ability, focusing solely on acquisition possibilities meeting these tests, have achieved excellent results in recent decades. However, very few enterprises possess both characteristics, and competition to buy those that do has now become fierce to the point of being self-defeating.

The second category involves the managerial superstars-men who can recognize that rare prince who is disguised as a toad, and who have managerial abilities that enable them to peel away the disguise. We salute such managers as Ben Heineman at Northwest Industries, Henry Singleton at Teledyne, Erwin Zaban at National Service Industries, and especially Tom Murphy at Capital Cities Communications (a real managerial "twofer", whose acquisition efforts have been properly focused in Category 1 and whose operating talents also make him a leader of Category 2). From both direct and vicarious experience, we recognize the difficulty and rarity of these executives' achievements. (So do they; these champs have made very few deals in recent years, and often have found repurchase of their own shares to be the most sensible employment of corporate capital.)

Your Chairman, unfortunately, does not qualify for Category 2. And, despite a reasonably good understanding of the economic factors compelling concentration in Category 1, our actual acquisition activity in that category has been sporadic and inadequate. Our preaching was better than our performance. (We neglected the Noah principle: predicting rain doesn't count, building arks does.)

We have tried occasionally to buy toads at bargain prices with results that have been chronicled in past reports. Clearly our kisses

fell fiat. We have done well with a couple of princes-but they were princes when purchased. At least our kisses didn't turn them into toads. And, finally, we have occasionally been quite successful in purchasing fractional interests in easily-identifiable princes at toad-like prices.

Berkshire and Blue Chip are considering merger in 1983. If it takes place, it will involve an exchange of stock based upon an identical valuation method applied to both companies. The one other significant issuance of shares by Berkshire or its affiliated companies that occurred during present management's tenure was in the 1978 merger of Berkshire with Diversified Retailing Company.

Our share issuances follow a simple basic rule: we will not issue shares unless we receive as much intrinsic business value as we give. Such a policy might seem axiomatic. Why, you might ask, would anyone issue dollar bills in exchange for fifty-cent pieces? Unfortunately, many corporate managers have been willing to do just that.

The first choice of these managers in making acquisitions may be to use cash or debt. But frequently the CEO's cravings outpace cash and credit resources (certainly mine always have). Frequently, also, these cravings occur when his own stock is selling far below intrinsic business value. This state of affairs produces a moment of truth. At that point, as Yogi Berra has said, "You can observe a lot just by watching." For shareholders then will find which objective the management truly prefers-expansion of domain or maintenance of owners' wealth.

The need to choose between these objectives occurs for some simple reasons. Companies often sell in the stock market below their intrinsic business value. But when a company wishes to sell out completely, in a negotiated transaction, it inevitably wants to-and usually can-receive full business value in whatever kind of currency the value is to be delivered. If cash is to be used in payment, the seller's calculation of value received couldn't be easier. If stock of the buyer is to be the currency, the seller's calculation is still relatively easy: just figure the market value in cash of what is to be received in stock.

Meanwhile, the buyer wishing to use his own stock as currency for the purchase has no problems if the stock is selling in the market at full intrinsic value.

But suppose it is selling at only half intrinsic value. In that case, the buyer is faced with the unhappy prospect of using a substantially undervalued currency to make its purchase.

Ironically, were the buyer to instead be a seller of its *entire* business, it too could negotiate for, and probably get, full intrinsic business value. But when the buyer makes a partial sale of itself-*and that is what the issuance of shares to make an acquisition amounts to-it* can customarily get no higher value set on its shares than the market chooses to grant it.

The acquirer who nevertheless barges ahead ends up using an undervalued (market value) currency to pay for a fully valued (negotiated value) property. In effect, the acquirer must give up $2 of value to receive $1 of value. Under such circumstances, a marvelous business purchased at a fair sales price becomes a terrible buy. For gold valued as gold cannot be purchased intelligently through the utilization of gold-or even silver-valued as lead.

If, however, the thirst for size and action is strong enough, the acquirer's manager will find ample rationalizations for such a value-destroying issuance of stock. Friendly investment bankers will reassure him as to the soundness of his actions. (Don't ask the barber whether you need a haircut.)

A few favorite rationalizations employed by stock-issuing managements follow:

(a) "The company we're buying is going to be worth a lot more in the future." (Presumably so is the interest in the old business that is being traded away; future prospects are implicit in the business valuation process. If 2X is issued for X, the imbalance still exists when both parts double in business value.)

(b) "We have to grow." (Who, it might be asked, is the "we"? For present shareholders, the reality is that all existing businesses shrink when shares are issued. Were Berkshire to issue shares tomorrow for an acquisition, Berkshire would own everything that it now owns plus the new business, but *your* interest in such hard-to-match businesses as See's Candy Shops, National Indemnity, etc. would automatically be reduced. If (1) your family owns a 120-acre farm and (2) you invite a neighbor with 60 acres of comparable land to merge his farm into an equal partnership-with you to be managing partner, then (3) your managerial domain will have grown to 180 acres but you will have permanently shrunk by 25% your family's ownership in-

terest in both acreage and crops. Managers who want to expand their domain at the expense of owners might better consider a career in government.)

(c) "Our stock is undervalued and we've minimized its use in this deal-but we need to give the selling shareholder 51% in stock and 49% in cash so that certain of those shareholders can get the tax-free exchange they want." (This argument acknowledges that it is beneficial to the acquirer to hold down the issuance of shares, and we like that. But if it hurts old owners to utilize shares on a 100% basis, it very likely hurts on a 51% basis. After all, a man is not charmed if a spaniel defaces his lawn, just because it's a spaniel and not a St. Bernard. And the wishes of sellers can't be the determinant of the best interests of the buyer-what would happen if, heaven forbid, the seller insisted that as a condition of merger the CEO of the acquirer be replaced?)

There are three ways to avoid destruction of value for old owners when shares are issued for acquisitions. One is to have a true business-value-for-business-value merger, such as the Berkshire-Blue Chip combination is intended to be. Such a merger attempts to be fair to shareholders of *both* parties, with each receiving just as much as it gives in terms of intrinsic business value. The Dart Industries-Kraft and Nabisco-Standard Brands mergers appeared to be of this type, but they are the exceptions. It's not that acquirers wish to avoid such deals; it's just that they are very hard to do.

The second route presents itself when the acquirer's stock sells at or above its intrinsic business value. In that situation, the use of stock as currency actually may enhance the wealth of the acquiring company's owners. Many mergers were accomplished on this basis in the 1965-69 period. The results were the converse of most of the activity since 1970: the shareholders of the *acquired* company received very inflated currency (frequently pumped up by dubious accounting and promotional techniques) and were the losers of wealth through such transactions.

During recent years the second solution has been available to very few large companies. The exceptions have primarily been those companies in glamorous or promotional businesses to which the market temporarily attaches valuations at or above intrinsic business valuation.

The third solution is for the acquirer to go ahead with the acquisition, but then subsequently repurchase a quantity of shares equal to the number issued in the merger. In this manner, what originally was a stock-for-stock merger can be converted, effectively, into a cash-for-stock acquisition. Repurchases of this kind are damage-repair moves. Regular readers will correctly guess that we much prefer repurchases that directly enhance the wealth of owners instead of repurchases that merely repair previous damage. Scoring touchdowns is more exhilarating than recovering one's fumbles. But, when a fumble has occurred, recovery is important and we heartily recommend damage-repair repurchases that turn a bad stock deal into a fair cash deal.

The language utilized in mergers tends to confuse the issues and encourage irrational actions by managers. For example, "dilution" is usually carefully calculated on a pro forma basis for both book value and current earnings per share. Particular emphasis is given to the latter item. When that calculation is negative (dilutive) from the acquiring company's standpoint, a justifying explanation will be made (internally, if not elsewhere) that the lines will cross favorably at some point in the future. (While deals often fail in practice, they never fail in projections-if the CEO is visibly panting over a prospective acquisition, subordinates and consultants will supply the requisite projections to rationalize any price.) Should the calculation produce numbers that are immediately positive-that is, anti-dilutive-for the acquirer, no comment is thought to be necessary.

The attention given this form of dilution is overdone: current earnings per share (or even earnings per share of the next few years) are an important variable in most business valuations, but far from all-powerful.

There have been plenty of mergers, non-dilutive in this limited sense, that were instantly value-destroying for the acquirer. And some mergers that have diluted current and near-term earnings per share have in fact been value-enhancing. What really counts is whether a merger is dilutive or anti-dilutive in terms of intrinsic business value (a judgment involving consideration of many variables). We believe calculation of dilution from this viewpoint to be all-important (and too seldom made).

A second language problem relates to the equation of exchange. If Company A announces that it will issue shares to merge with Company B, the process is customarily described as "Company A to Acquire Company B", or "B Sells to A". Clearer think-

ing about the matter would result if a more awkward but more accurate description were used: "Part of A sold to acquire B", or "Owners of B to receive part of A in exchange for their properties". In a trade, what you are giving is just as important as what you are getting. This remains true even when the final tally on what is being given is delayed. Subsequent sales of common stock or convertible issues, either to complete the financing for a deal or to restore balance sheet strength, must be fully counted in evaluating the fundamental mathematics of the original acquisition. (If corporate pregnancy is going to be the consequence of corporate mating, the time to face that fact is before the moment of ecstasy.)

Managers and directors might sharpen their thinking by asking themselves if they would sell 100% of their business on the same basis they are being asked to sell part of it. And if it isn't smart to sell all on such a basis, they should ask themselves why it is smart to sell a portion. A cumulation of small managerial stupidities will produce a major stupidity-not a major triumph. (Las Vegas has been built upon the wealth transfers that occur when people engage in seemingly-small disadvantageous capital transactions.)

The "giving versus getting" factor can most easily be calculated in the case of registered investment companies. Assume Investment Company X, selling at 50% of asset value, wishes to merge with Investment Company Y. Assume, also, that Company X therefore decides to issue shares equal in market value to 100% of Y's asset value.

Such a share exchange would leave X trading $2 of its previous intrinsic value for $1 of Y's intrinsic value. Protests would promptly come forth from both X's shareholders and the SEC, which rules on the fairness of registered investment company mergers. Such a transaction simply would not be allowed.

In the case of manufacturing, service, financial companies, etc., values are not normally as precisely calculable as in the case of investment companies. But we have seen mergers in these industries that just as dramatically destroyed value for the owners of the acquiring company as was the case in the hypothetical illustration above. This destruction could not happen if management and directors would assess the fairness of any transaction by using the same yardstick in the measurement of both businesses.

Finally, a word should be said about the "double whammy" effect upon owners of the acquiring company when value-diluting stock issuances occur. Under such circumstances, the first blow is the loss of intrinsic business value that occurs through the merger

itself. The second is the downward revision in market valuation that, quite rationally, is given to that now-diluted business value. For current and prospective owners understandably will not pay as much for assets lodged in the hands of a management that has a record of wealth-destruction through unintelligent share issuances as they will pay for assets entrusted to a management with precisely equal operating talents, but a known distaste for anti-owner actions. Once management shows itself insensitive to the interests of owners, shareholders will suffer a long time from the price/value ratio afforded their stock (relative to other stocks), no matter what assurances management gives that the value-diluting action taken was a one-of-a-kind event.

Those assurances are treated by the market much as one-bug-in-the-salad explanations are treated at restaurants. Such explanations, even when accompanied by a new waiter, do not eliminate a drop in the demand (and hence market value) for salads, both on the part of the offended customer and his neighbors pondering what to order. Other things being equal, the highest stock market prices relative to intrinsic business value are given to companies whose managers have demonstrated their unwillingness to issue shares at any time on terms unfavorable to the owners of the business.

[I]n contemplating business mergers and acquisitions, many managers tend to focus on whether the transaction is immediately dilutive or anti-dilutive to earnings per share (or, at financial institutions, to per-share book value). An emphasis of this sort carries great dangers. . . . [I]magine that a 25-year-old first-year MBA student is considering merging his future economic interests with those of a 25-year-old day laborer. The MBA student, a non-earner, would find that a "share-for-share" merger of his equity interest in himself with that of the day laborer would enhance his near-term earnings (in a big way!). But what could be sillier for the student than a deal of this kind?

In corporate transactions, it's equally silly for the would-be purchaser to focus on current earnings when the prospective acquiree has either different prospects, a different mix of operating and non-operating assets, or a different capital structure. At Berkshire, we have rejected many merger and purchase opportunities that would have boosted current and near-term earnings but that would have reduced per-share intrinsic value. Our approach, rather, has been to follow Wayne Gretzky's advice: "Go to where

the puck is going to be, not to where it is." As a result, our shareholders are now many billions of dollars richer than they would have been if we had used the standard catechism.

The sad fact is that most major acquisitions display an egregious imbalance: They are a bonanza for the shareholders of the acquiree; they increase the income and status of the acquirer's management; and they are a honey pot for the investment bankers and other professionals on both sides. But, alas, they usually reduce the wealth of the acquirer's shareholders, often to a substantial extent. That happens because the acquirer typically gives up more intrinsic value than it receives. Do that enough, says John Medlin, the retired head of Wachovia Corp., and "you are running a chain letter in reverse."

Over time, the skill with which a company's managers allocate capital has an enormous impact on the enterprise's value. Almost by definition, a really good business generates far more money (at least after its early years) than it can use internally. The company could, of course, distribute the money to shareholders by way of dividends or share repurchases. But often the CEO asks a strategic planning staff, consultants or investment bankers whether an acquisition or two might make sense. That's like asking your interior decorator whether you need a $50,000 rug.

The acquisition problem is often compounded by a biological bias: Many CEO's attain their positions in part because they possess an abundance of animal spirits and ego. If an executive is heavily endowed with these qualities-which, it should be acknowledged, sometimes have their advantages-they won't disappear when he reaches the top. When such a CEO is encouraged by his advisors to make deals, he responds much as would a teenage boy who is encouraged by his father to have a normal sex life. It's not a push he needs.

Some years back, a CEO friend of mine-in jest, it must be said-unintentionally described the pathology of many big deals. This friend, who ran a property-casualty insurer, was explaining to his directors why he wanted to acquire a certain life insurance company. After droning rather unpersuasively through the economics and strategic rationale for the acquisition, he abruptly abandoned the script. With an impish look, he simply said: "Aw, fellas, all the other kids have one."

At Berkshire, our managers will continue to earn extraordinary returns from what appear to be ordinary businesses. As a first step, these managers will look for ways to deploy their earnings

advantageously in their businesses. What's left, they will send to Charlie and me. We then will try to use those funds in ways that build per-share intrinsic value. Our goal will be to acquire either part or all of businesses that we believe we understand, that have good, sustainable underlying economics, and that are run by managers whom we like, admire and trust.

B. *Sensible Stock Repurchases Versus Greenmaip9*

The companies in which we have our largest investments have all engaged in significant stock repurchases at times when wide discrepancies existed between price and value. As shareholders, we find this encouraging and rewarding for two important reasons- one that is obvious, and one that is subtle and not always understood. The obvious point involves basic arithmetic: major repurchases at prices well below per-share intrinsic business value immediately increase, in a highly significant way, that value. When companies purchase their own stock, they often find it easy to get $2 of present value for $1. Corporate acquisition programs almost never do as well and, in a discouragingly large number of cases, fail to get anything close to $1 of value for each $1 expended.

The other benefit of repurchases is less subject to precise measurement but can be fully as important over time. By making repurchases when a company's market value is well below its business value, management clearly demonstrates that it is given to actions that enhance the wealth of shareholders, rather than to actions that expand management's domain but that do nothing for (or even harm) shareholders. Seeing this, shareholders and potential shareholders increase their estimates of future returns from the business. This upward revision, in turn, produces market prices more in line with intrinsic business value. These prices are entirely rational. Investors should pay more for a business that is lodged in the hands of a manager with demonstrated pro-shareholder leanings than for one in the hands of a self-interested manager marching to a different drummer. (To make the point extreme, how much would you pay to be a minority shareholder of a company controlled by Robert Vesco?)

The key word is "demonstrated". A manager who consistently turns his back on repurchases, when these clearly are in the interests of owners, reveals more than he knows of his motivations. No matter how often or how eloquently he mouths some public rela-

---

39 [Divided by hash lines: 1984; 1984.]

tions-inspired phrase such as "maximizing shareholder wealth" (this season's favorite), the market correctly discounts assets lodged with him. His heart is not listening to his mouth-and, after a while, neither will the market.

(Our endorsement of repurchases is limited to those dictated by price/value relationships and does not extend to the "greenmail" repurchase-a practice we find odious and repugnant. **In** these transactions, two parties achieve their personal ends by exploitation of an innocent and unconsulted third party. The players are: (1) the "shareholder" extortionist who, even before the ink on his stock certificate dries, delivers his "your-money-or-your-life" message to managers; (2) the corporate insiders who quickly seek peace at any price-as long as the price is paid by someone else; and (3) the shareholders whose money is used by (2) to make (1) go away. As the dust settles, the mugging, transient shareholder gives his speech on "free enterprise", the muggee management gives its speech on "the best interests of the company", and the innocent shareholder standing by mutely funds the payoff.)

C. *Leveraged Buyouts*[40]

If successful corporate business acquisition is so hard, how does one explain the widespread recent success of most of the leveraged-buy-out ("LBO") operators who have purchased corporations? A huge part of the answer comes from income-tax effects and other simple effects. When, in a typical LBO, the typical mostly equity corporate capitalization was replaced by 90% debt plus a new lO%-of-capitalization common stock position:

(1) the combined market value of all the new common stock plus all the new debt became much higher than the previous market value of all the older common stock, because the existing stream of pre-tax earnings was no longer shared with corporate income tax collectors who, in many cases, had previously received more cash each year than shareholders; and

(2) even after the value-enhancing effect of the corporate tax reduction was shared with former shareholders by paying them extra-high prices to leave, a retained residue of value-enhancing tax effect made the new common stock

---

40 [1989 Wesco Financial Corporation Letter to Shareholders, by Charles T. Munger. Reprinted with permission.]

(which now became much like a speculative warrant with good terms) worth considerably more than cost as the ink dried on acquisition papers; and

(3) the new "owners" then resorted to strategies, difficult neither to conceive nor implement, including the following:
   (a) they eliminated many of the easily removable costs (largely personnel costs) and sub-par segments which in some mix (i) bedevil successful corporations (including ours) with sloth and folly and (ii) create their humane grace and, through present sacrifice, good long-term prospects, justifying sacrifice endured; and
   (b) they sold off a few operations at super-high prices, sometimes exercising the easiest microeconomic insight by selling to a direct competitor and sometimes selling to a surprisingly easy-to-find non-competitive corporate buyer, not owned by its managers, willing to pay almost as high a price as a competitor would; and

(4) the new "owners" then profited, in due course, not only from the tax effect and other simple reshuffling activities described above, but also from the wonderful upside effects of extreme financial leverage during a long business boom accompanied by a rising stock market.

Whether the country wants a large number (or even any) of its large corporations to have extremely leveraged capitalizations, except through occasional adversity, presents interesting social questions. Is one social function of corporations to be financially strong so that they act as shock absorbers, protecting dependent employees, suppliers and customers from part of the volatility implicit in capitalism? Was Ben Franklin right when he included the following folk wisdom in *Poor Richard's Almanac:* "It is hard for an empty sack to stand upright." Is a weak corporation, borrowed to the hilt, the social equivalent of a bridge with an inadequate reserve of structural strength? Granting that leveraged buyouts have some favorable effects (as well as unfavorable effects) on long term efficiency, how many thousands of able people do we wish to attract into promotional corporate recapitalization activity which (1) reduces corporate income taxes, (2) often tests the limits of antitrust law, and (3) focuses business attention on short-term cash generation to pay down oppressive levels of debt? Finally, as Columbia Law School's Professor Lou Lowenstein puts it (more or

less): "Do we really want entire corporate businesses, as important social institutions, continuously traded like pork belly contracts?"

However the social questions are answered, three aspects of the present situation are clear. First, the corporate tax effect is so large in LBO transactions that easy success in such transactions does not imply that success is easy in ordinary corporate acquisitions. Second, the hordes of leveraged-buy-out operators now with us raise the general level of acquisition prices to the detriment of other would-be acquirers, including Wesco, which are not willing to maximize tax benefits through maximized borrowing. And, third, the LBO operator will not go away so long as present permissive laws last. The operators have a real advantage under such laws, not just a fig leaf aiding promotion. Even though failure and disgrace will reduce their number, and prices paid in leveraged-buy-out transactions will fall, the capitalized value of reducing the corporate income tax will remain. Therefore, plenty of rational incentive will remain for transactions. The LBO genie will encounter reverses, but he is not going back in the bottle unless ordered to do so by new laws.

It should also be noted that the LBO operators' incentives to bid high do not end with real advantages derived from tax law and willingness to reshuffle businesses with much speed and few scruples. Additional incentives for high bids come from typical structures in which general partners of LBO partnerships risk little of their own money (often less than none after fees are taken into account), yet share significantly in gains. Such arrangements are similar to the system of the race track tout. And who has ever seen a tout who didn't want his backer to make a lot of bets?

To Wesco, as a non-LBO operator, the good-corporate-acquisition game was always tough. And that game in each recent year has become more like fishing for muskies at Leech Lake, in Minnesota, where the writer's earliest business partner, Ed Hoskins, had the following conversation with his Indian guide:

"Are any muskies caught in this lake?"

"More muskies are caught in this lake than in any other lake in Minnesota. This lake is famous for muskies."

"How long have you been fishing here?"

"19 years."

"And how many muskies have you caught?"

"None."

When a management has our point of view, infrequency of business acquisition may safely be predicted. Whether this hap-

pens, as we like to believe, because the game is hard for almost everyone, or merely because the game is hard for us, the result for Wesco shareholders is the same: less worthwhile activity than we all would like. But there may be one consolation: A series of big, incorrectable acquisition troubles, with no meaningful salvage, is seldom caused by people who think the acquisition game is like fishing for muskies at Leech Lake.

D. *Sound Acquisition Policies*[41]

It may seem strange that we exult over a year in which we made three acquisitions, given that we have regularly used these pages to question the acquisition activities of most managers. Rest assured, Charlie and I haven't lost our skepticism: We believe most deals do damage to the shareholders of the acquiring company. Too often, the words from *HMS Pinafore* apply: "Things are seldom what they seem, skim milk masquerades as cream." Specifically, sellers and their representatives invariably present financial projections having more entertainment value than educational value. In the production of rosy scenarios, Wall Street can hold its own against Washington.

In any case, why potential buyers even look at projections prepared by sellers baffles me. Charlie and I never give them a glance, but instead keep in mind the story of the man with an ailing horse. Visiting the vet, he said: "Can you help me? Sometimes my horse walks just fine and sometimes he limps." The vet's reply was pointed: "No problem-when he's walking fine, sell him." In the world of mergers and acquisitions, that horse would be peddled as Secretariat.

At Berkshire, we have all the difficulties in perceiving the future that other acquisition-minded companies do. Like they [sic] also, we face the inherent problem that the seller of a business practically always knows far more about it than the buyer and also picks the time of sale-a time when the business is likely to be walking "just fine."

Even so, we do have a few advantages, perhaps the greatest being that we *don't* have a strategic plan. Thus we feel no need to proceed in an ordained direction (a course leading almost invariably to silly purchase prices) but can instead simply decide what makes sense for our owners. In doing that, we always mentally

41 [Divided by hash lines: 1995; 1991 (the latter with similar versions beginning in 1982 and continuting thereafter).]

compare any move we are contemplating with dozens of other opportunities open to us, including the purchase of small pieces of the best businesses in the world via the stock market. Our practice of making this comparison-acquisitions against passive investments-is a discipline that managers focused simply on expansion seldom use.

Talking to *Time Magazine* a few years back, Peter Drucker got to the heart of things: "I will tell you a secret: Dealmaking beats working. Dealmaking is exciting and fun, and working is grubby. Running anything is primarily an enormous amount of grubby detail work . . . dealmaking is romantic, sexy. That's why you have deals that make no sense."

In making acquisitions, we have a further advantage: As payment, we can offer sellers a stock backed by an extraordinary collection of outstanding businesses. An individual or a family wishing to dispose of a single fine business, but also wishing to defer personal taxes indefinitely, is apt to find Berkshire stock a particularly comfortable holding. I believe, in fact, that this calculus played an important part in the two acquisitions for which we paid shares in 1995.

Beyond that, sellers sometimes care about placing their companies in a corporate home that will both endure and provide pleasant, productive working conditions for their managers. Here again, Berkshire offers something special. Our managers operate with extraordinary autonomy. Additionally, our ownership structure enables sellers to know that when I say we are buying to keep, the promise means something. For our part, we like dealing with owners who care what happens to their companies and people. A buyer is likely to find fewer unpleasant surprises dealing with that type of seller than with one simply auctioning off his business.

In addition to the foregoing being an explanation of our acquisition style, it is, of course, a not-so-subtle sales pitch. If you own or represent a business earning $25 million or more before tax, and it fits the criteria [set forth below], just give me a call. Our discussion will be confidential. And if you aren't interested now, file our proposition in the back of your mind: We are never going to lose our appetite for buying companies with good economics and excellent management.

Concluding this little dissertation on acquisitions, I can't resist repeating a tale told me last year by a corporate executive. The business he grew up in was a fine one, with a long-time record of leadership in its industry. Its main product, however, was distress-

ingly glamorless. So several decades ago, the company hired a management consultant who-naturally-advised diversification, the then-current fad. ("Focus" was not yet in style.) Before long, the company acquired a number of businesses, each after the consulting firm had gone through a long-and expensive-acquisition study. And the outcome? Said the executive sadly, "When we started, we were getting 100% of our earnings from the original business. After ten years, we were getting 150%."

It's discouraging to note that though we have on four occasions made major purchases of companies whose sellers were represented by prominent investment banks, we were in only one of these instances contacted by the investment bank. In the other three cases, I myself or a friend initiated the transaction at some point after the investment bank had solicited its own list of prospects. We would love to see an intermediary earn its fee by thinking of us-and therefore repeat here what we're looking for:

(1) Large purchases (at least $10 million of after-tax earnings),
(2) Demonstrated consistent earning power (future projections are of little interest to us, nor are "turnaround" situations),
(3) Businesses earning good returns on equity while employing little or no debt,
(4) Management in place (we can't supply it),
(5) Simple businesses (if there's lots of technology, we won't understand it),
(6) An offering price (we don't want to waste our time or that of the seller by talking, even preliminarily, about a transaction when price is unknown).

We will not engage in unfriendly takeovers. We can promise complete confidentiality and a very fast answer-customarily within five minutes-as to whether we're interested. (With [H.H.] Brown, we didn't even need to take five.) We prefer to buy for cash, but will consider issuing stock when we receive as much in intrinsic business value as we give.

Our favorite form of purchase is one [in which] the company's owner-managers wish to generate significant amounts of cash, sometimes for themselves, but often for their families or inactive shareholders. At the same time, these managers wish to remain significant owners who continue to run their companies just as they have in the past. We think we offer a particularly good fit for own-

ers with such objectives, and we invite potential sellers to check us out by contacting people with whom we have done business in the past.

Charlie and I frequently get approached about acquisitions that don't come close to meeting our tests: We've found that if you advertise an interest in buying collies, a lot of people will call hoping to sell you their cocker spaniels. A line from a country song expresses our feeling about new ventures, turnarounds, or auction-like sales: "When the phone don't ring, you'll know it's me."[42]

Besides being interested in the purchase of businesses as described above, we are also interested in the negotiated purchase of large, but not controlling, blocks of stock comparable to those we hold in Capital Cities, Salomon, Gillette, USAir, Champion, and American Express. We are not interested, however, in receiving suggestions about purchases we might make in the general stockmarket.

E. *On Selling One's Business*[43]

Most business owners spend the better part of their lifetimes building their businesses. By experience built upon endless repetition, they sharpen their skills in merchandising, purchasing, personnel selection, etc. It's a learning process, and mistakes made in one year often contribute to competence and success in succeeding years.

In contrast, owner-managers sell their business only once-frequently in an emotionally-charged atmosphere with a multitude of pressures coming from different directions. Often, much of the pressure comes from brokers whose compensation is contingent upon consummation of a sale, regardless of its consequences for both buyer and seller. The fact that the decision is so important, both financially and personally, to the owner can make the process more, rather than less, prone to error. And, mistakes made in the once-in-a-lifetime sale of a business are not reversible.

Price is very important, but often is not the most critical aspect of the sale. You and your family have an extraordinary business-one of a kind in your field-and any buyer is going to recognize that. It's also a business that is going to get more valuable as the years go by. So if you decide not to sell now, you are very likely to

---

42 [In 1988 and 1989, the last sentence read: "Our interest in new ventures, turnarounds, or auction-like sales can best be expressed by the Goldwynism: 'Please include me out.'"]

43 [1990 Appendix B-form of letter sent to potential sellers of businesses.]

realize more money later on. With that knowledge you can deal from strength and take the time required to select the buyer you want.

If you should decide to sell, I think Berkshire Hathaway offers some advantages that most other buyers do not. Practically all of these buyers will fall into one of two categories:

(1) A company located elsewhere but operating in your business or in a business somewhat akin to yours. Such a buyer-no matter what promises are made-will usually have managers who feel they know how to run your business operations and, sooner or later, will want to apply some hands-on "help." If the acquiring company is much larger, it often will have squads of managers, recruited over the years in part by promises that they will get to run future acquisitions. They will have their own way of doing things and, even though your business record undoubtedly will be far better than theirs, human nature will at some point cause them to believe that their methods of operating are superior. You and your family probably have friends who have sold their businesses to larger companies, and I suspect that their experiences will confirm the tendency of parent companies to take over the running of their subsidiaries, particularly when the parent knows the industry, or thinks it does.

(2) A financial maneuverer, invariably operating with large amounts of borrowed money, who plans to resell either to the public or to another corporation as soon as the time is favorable. Frequently, this buyer's major contribution will be to change accounting methods so that earnings can be presented in the most favorable light just prior to his bailing out. . . . [T]his sort of transaction . . . is becoming much more frequent because of a rising stock market and the great supply of funds available for such transactions.

If the sole motive of the present owners is to cash their chips and put the business behind them-and plenty of sellers fall in this category-either type of buyer that I've just described is satisfactory. But if the sellers' business represents the creative work of a lifetime and forms an integral part of their personality and sense of being, buyers of either type have serious flaws.

Berkshire is another kind of buyer-a rather unusual one. We buy to keep, but we don't have, and don't expect to have, operating people in our parent organization. All of the businesses we own are run autonomously to an extraordinary degree. In most cases, the managers of important businesses we have owned for many

years have not been to Omaha or even met each other. When we buy a business, the sellers go on running it just as they did before the sale; we adapt to their methods rather than vice versa.

We have no one-family, recently recruited MBAs, etc.-to whom we have promised a chance to run businesses we have bought from owner-managers. And we won't have.

You know of some of our past purchases. I'm enclosing a list of everyone from whom we have ever bought a business, and I invite you to check with them as to our performance versus our promises. You should be particularly interested in checking with the few whose businesses did not do well in order to ascertain how we behaved under difficult conditions.

Any buyer will tell you that he needs you personally-and if he has any brains, he most certainly does need you. But a great many buyers, for the reasons mentioned above, don't match their subsequent actions to their earlier words. We will behave exactly as promised, both because we have so promised, and because we need to in order to achieve the best business results.

This need explains why we would want the operating members of your family to retain a 20% interest in the business. We need 80% to consolidate earnings for tax purposes, which is a step important to us. It is equally important to us that the family members who run the business remain as owners. Very simply, we would not want to buy unless we felt key members of present management would stay on as our partners. Contracts cannot guarantee your continued interest; we would simply rely on your word.

The areas I get involved in are capital allocation and selection and compensation of the top man. Other personnel decisions, operating strategies, etc. are his bailiwick. Some Berkshire managers talk over some of their decisions with me; some don't. It depends upon their personalities and, to an extent, upon their own personal relationship with me.

If you should decide to do business with Berkshire, we would pay in cash. Your business would not be used as collateral for any loan by Berkshire. There would be no brokers involved.

Furthermore, there would be no chance that a deal would be announced and that the buyer would then back off or start suggesting adjustments (with apologies, of course, and with an explanation that banks, lawyers, boards of directors, etc. were to be blamed). And finally, you would know exactly with whom you are dealing. You would not have one executive negotiate the deal only to have someone else in charge a few years later, or have the presi-

dent regretfully tell you that his board of directors required this change or that (or possibly required sale of your business to finance some new interest of the parent's).

It's only fair to tell you that you would be no richer after the sale than now. The ownership of your business already makes you wealthy and soundly invested. A sale would change the form of your wealth, but it wouldn't change its amount. If you sell, you will have exchanged a 100%-owned valuable asset that you understand for another valuable asset-cash-that will probably be invested in small pieces (stocks) of other businesses that you understand less well. There is often a sound reason to sell but, if the transaction is a fair one, the reason is not so that the seller can become wealthier.

I will not pester you; if you have any possible interest in selling, I would appreciate your call. I would be extraordinarily proud to have Berkshire, along with the key members of your family, own _____; I believe we would do very well financially; and I believe you would have just as much fun running the business over the next 20 years as you have had during the past 20.

Sincerely,

/s/ Warren E. Buffett

V. ACCOUNTING AND TAXATION

To those of you who are uninterested in accounting, I apologize for this dissertation. I realize that many of you do not pore over our figures, but instead hold Berkshire primarily because you know that: (1) Charlie and I have the bulk of our money in Berkshire; (2) we intend to run things so that your gains or losses are in direct proportion to ours; (3) the record has so far been satisfactory. There is nothing necessarily wrong with this kind of "faith" approach to investing. Other shareholders, however, prefer an "analysis" approach and we want to supply the information they need. In our own investing, we search for situations in which both approaches give us the same answer.[44]

A. *A Satire on Accounting Shenanigans*[45]

*u.S. STEEL ANNOUNCES SWEEPING MODERNIZATION SCHEME**

Myron C. Taylor, Chairman of U.S. Steel Corporation, today announced the long awaited plan for completely modernizing the world's largest industrial enterprise. Contrary to expectations, no changes will be made in the company's manufacturing or selling policies. Instead, the bookkeeping system is to be entirely revamped. By adopting and further improving a number of modern accounting and financial devices the corporation's earning power will be amazingly transformed. Even under the subnormal conditions of 1935, it is estimated that the new bookkeeping methods would have yielded a reported profit of close to $50 per share on the common stock. The scheme of improvement is the result of a comprehensive survey made by Messrs. Price, Bacon, Guthrie & Colpitts; it includes the following six points:

1. Writing down of Plant Account to Minus $1,000,000,000.
2. Par Value of Common Stock to be reduced to 1¢.
3. Payment of all wages and salaries in option warrants.
4. Inventories to be carried at $1.
5. Preferred Stock to be replaced by non-interest bearing bonds redeemable at 50% discount.
6. A $1,000,000,000 Contingency Reserve to be established.

---

44 [Introductory paragraph, 1988.]

45 [1990 Appendix A.]

* An unpublished satire by Ben Graham, written in 1936 and given by the author to Warren Buffett in 1954.

The official statement of this extraordinary Modernization Plan follows in full:

The Board of Directors of U.S. Steel Corporation is pleased to announce that after intensive study of the problems arising from changed conditions in the industry, it has approved a comprehensive plan for remodeling the Corporation's accounting methods. A survey by a Special Committee, aided and abetted by Messrs. Price, Bacon, Guthrie & Colpitts, revealed that our company has lagged somewhat behind other American business enterprises in utilizing certain advanced bookkeeping methods, by means of which the earning power may be phenomenally enhanced without requiring any cash outlay or any changes in operating or sales conditions. It has been decided not only to adopt these newer methods, but to develop them to a still higher stage of perfection. The changes adopted by the Board may be summarized under six heads, as follows:

1. Fixed Assets to be written down to *Minus $1,000,000,000.*

Many representative companies have relieved their income accounts of all charges for depreciation by writing down their plant account to $1. The Special Committee points out that if their plants are worth only $1, the fixed assets of U.S. Steel Corporation are worth a good deal less than that sum. It is now a well-recognized fact that many plants are in reality a liability rather than an asset, entailing not only depreciation charges, but taxes, maintenance, and other expenditures. Accordingly, the Board has decided to extend the write-down policy initiated in the 1935 report, and to mark down the Fixed Assets from $1,338,522,858.96 to a round *Minus $1,000,000,000.*

The advantages of this move should be evident. As the plant wears out, the liability becomes correspondingly reduced. Hence, instead of the present depreciation charge of some $47,000,000 yearly there will be an annual *appreciation credit* of 5%, or $50,000,000. This will increase earnings by no less than $97,000,000 per annum.

2. Reduction of Par Value of Common Stock to 1¢, and

3. Payment of Salaries and Wages in Option Warrants.

Many corporations have been able to reduce their overhead expenses substantially by paying a large part of their executive salaries in the form of options to buy stock, which carry no charge against earnings. The full possibilities of this modem device have

apparently not been adequately realized. The Board of Directors have adopted the following advanced form of this idea:

The entire personnel of the Corporation are to receive their compensation in the form of rights to buy common stock at $50 per share, at the rate of one purchase right for each $50 of salary and! or wages in their present amounts. The par value of the common stock is to be reduced to 1¢.

The almost incredible advantages of this new plan are evident from the following:

A. The payroll of the Corporation will be entirely eliminated, a saving of $250,000,000 per annum, based on 1935 operations.

B. At the same time, the effective compensation of all our employees will be increased severalfold. Because of the large earnings per share to be shown on our common stock under the new methods, it is certain that the shares will command a price in the market far above the option level of $50 per share, making the readily realizable value of these option warrants greatly in excess of the present cash wages that they will replace.

C. The Corporation will realize an additional large annual profit through the exercise of these warrants. Since the par value of the common stock will be fixed at 1¢, there will be a gain of $49.99 on each share subscribed for. In the interest of conservative accounting, however, this profit will not be included in the income account, but will be shown separately as a credit to Capital Surplus.

D. The Corporation's cash position will be enormously strengthened. In place of the present annual cash *outgo* of $250,000,000 for wages (1935 basis), there will be annual cash *inflow* of $250,000,000 through exercise of the subscription warrants for 5,000,000 shares of common stock. The Company's large earnings and strong cash position will permit the payment of a liberal dividend which, in turn, will result in the exercise of these option warrants immediately after issuance which, in turn, will further improve the cash position which, in turn, will permit a higher dividend rate-and so on, indefinitely.

4. Inventories to be carried at $1.

Serious losses have been taken during the depression due to the necessity of adjusting inventory value to market. Various enterprises-notably in the metal and cotton-textile fields-have successfully dealt with this problem by carrying all or part of their inventories at extremely low unit prices. The U.S. Steel Corpora-

tion has decided to adopt a still more progressive policy~ and to carry its entire inventory at $1. This will be effected by an appropriate write-down at the end of each year, the amount of ,said write-down to be charged to the Contingency Reserve hereinafter referred to.

The benefits to be derived from this new method are very great. Not only will it obviate all possibility of inventory depreciation, but it will substantially enhance the annual earnings of the Corporation. The inventory on hand at the beginning of the year, valued at $1, will be sold during the year at an excellent profit. It is estimated that our income will be increased by means of this method to the extent of at least $150,000,000 per annum which, by a coincidence, will about equal the amount of the write-down to be made each year against Contingency Reserve.

A minority report of the Special Committee recommends that Accounts Receivable and Cash also be written down to $1, in the interest of consistency and to gain additional advantages similar to those just discussed. This proposal has been rejected for the time being because our auditors still require that any recoveries of receivables and cash so charged off be credited to surplus instead of to the year's income. It is expected, however, that this auditing rule-which is rather reminiscent of the horse-and-buggy days-will soon be changed in line with modern tendencies. Should this occur, the minority report will be given further and favorable consideration.

5. Replacement of Preferred Stock by Non-Interest Bearing Bonds Redeemable at 50% Discount.

During the recent depression many companies have been able to offset their operating losses by including in income profits arising from repurchases of their own bonds at a substantial discount from par. Unfortunately the credit of U.S. Steel Corporation has always stood so high that this lucrative source of revenue has not hitherto been available to it. The Modernization Scheme will remedy this condition.

It is proposed that each share of preferred stock be exchanged for $300 face value of non-interest-bearing sinking-fund notes, redeemable by lot at 50% of face value in 10 equal annual installments. This will require the issuance of $1,080,000,000 of new notes, of which $108,000,000 will be retired each year at a cost to the Corporation of only $54,000,000, thus creating an annual profit of the same amount.

, Like the wage-and/or-salary plan described under 3. above, this' arrangement will benefit both the Corporation and its preferred stockholders. The latter are assured payment for their present shares at 150% of par value over an average period of five years. Since short-term securities yield practically no return at present, the non-interest-bearing feature is of no real importance. The Corporation will convert its present annual *charge* of $25,000,000 for preferred dividends into an annual bond-retirement *profit* of $54,000,000-an aggregate yearly gain of $79,000,000.

6. Establishment of a Contingency Reserve of $1,000,000,000.

The Directors are confident that the improvements hereinbefore described will assure the Corporation of a satisfactory earning power under all conditions in the future. Under modem accounting methods, however, it is unnecessary to incur the slightest risk of loss through adverse business developments of any sort, since all these may be provided for in advance by means of a Contingency Reserve.

The Special Committee has recommended that the Corporation create such a Contingency Reserve in the fairly substantial amount of $1,000,000,000. As previously set forth, the annual write-down of inventory of $1 will be absorbed by this reserve. To prevent eventual exhaustion of the Contingency Reserve, it has been further decided that it be replenished each year by transfer of an appropriate sum from Capital Surplus. Since the latter is expected to increase each year by not less than $250,000,000 through the exercise of the Stock Option Warrants (see 3. above), it will readily make good any drains on the Contingency Reserve.

In setting up this arrangement, the Board of Directors must confess regretfully that they have been unable to improve upon the devices already employed by important corporations in transferring large sums between Capital, Capital Surplus, Contingency Reserves and other Balance Sheet Accounts. In fact, it must be admitted that our entries will be somewhat too simple, and will lack that element of extreme mystification that characterizes the most advanced procedure in this field. The Board of Directors, however, have insisted upon clarity and simplicity in framing their Modernization Plan, even at the sacrifice of possible advantage to the Corporation's earning power.

In order to show the combined effect for the new proposals upon the Corporation's earning power, we submit herewith a condensed Income Account for 1935 on two bases, viz:

	A. As Reported	B. Pro-Forma Giving Effect to Changes Proposed Herewith
Gross Receipts from all Sources (Including Inter Company)	$765,000,000	$765,000,000
Salaries and Wages	251,000,000	
Other Operating Expenses and Taxes	461,000,000	311,000,000
DepreciatIon	47,000,000	(50,000,000)
Interest	5,000,000	5,000,000
Discount on Bonds Retired		(54,000,000)
Preferred Dividends	25,000,000	
Balance for Common	(24,000,000)	553,000,000
Average Shares Outstanding	8,703,252	11,203,252
Earned Per Share	($2.76)	$49.80

In accordance with a somewhat antiquated custom there is appended herewith a condensed pro-forma Balance Sheet of the U.S. Steel Corporation as of December 31, 1935, after giving effect to proposed changes in asset and liability accounts.

ASSETS

Fixed Assets, net	($1,000,000,000)
Cash Assets	142,000,000
Receivables	56,000,000
Inventory	1
Miscellaneous Assets	27,000,000
Total	($774,999,999)

LIABILITIES

Common Stock Par 1¢ (Par Value $87,032.52) Stated Value*	($3,500,000,000)
Subsidiaries' Bonds and Stocks	113,000,000
New Sinking Fund Notes	1,080,000,000
Current Liabilities	69,000,000
Contingency Reserve	1,000,000,000
Other Reserves	74,000,000
Initial Surplus	389,000,001
Total	($774,999,999)

*Given a Stated Value differing from Par Value, in accordance with the laws of the State of Virginia, where the company will be re-incorporated.

It is perhaps unnecessary to point out to our stockholders that modern accounting methods give rise to balance sheets differing somewhat in appearance from those of a less advanced period. In view of the very large earning power that will result from these

changes in the Corporation's Balance Sheet, it is not expected that undue attention will be paid to the details of assets and liabilities.

In conclusion, the Board desires to point out that the combined procedure, whereby plant will be carried at a minus figure, our wage bill will be eliminated, and inventory will stand on our books at virtually nothing, will give U.S. Steel Corporation an enormous competitive advantage in the industry. We shall be able to sell our products at exceedingly low prices and still show a handsome margin of profit. It is the considered view of the Board of Directors that under the Modernization Scheme we shall be able to undersell all competitors to such a point that the anti-trust laws will constitute the only barrier to 100% domination of the industry.

In making this statement, the Board is not unmindful of the possibility that some of our competitors may seek to offset our new advantages by adopting similar accounting improvements. We are confident, however, that U.S. Steel will be able to retain the loyalty of its customers, old and new, through the unique prestige that will accrue to it as the originator and pioneer in these new fields of service to the user of steel. Should necessity arise, moreover, we believe we shall be able to maintain our deserved superiority by introducing still more advanced bookkeeping methods, which are even now under development in our Experimental Accounting Laboratory.

B. *Look-Through Earnings*[46]

When one company owns part of another company, appropriate accounting procedures pertaining to that ownership interest must be selected from one of three major categories. The percentage of voting stock that is owned, in large part, determines which category of accounting principles should be utilized.

Generally accepted accounting principles require (subject to exceptions, naturally . . .) full consolidation of sales, expenses, taxes, and earnings of business holdings more than 50% owned. Blue Chip Stamps, 60% owned by Berkshire Hathaway Inc., falls into this category. Therefore, all Blue Chip income and expense items are included in full in Berkshire's Consolidated Statement of Earnings, with the 40% ownership interest of others in Blue Chip's net earnings reflected in the Statement as a deduction for "minority interest".

---

46 [Divided by hash lines: 1980; 1990; 1982; 1991, 1979.]

Full inclusion of underlying earnings from another class of holdings, companies owned 20% to 50% (usually called "investees"), also normally occurs. Earnings from such companies-.for example, Wesco Financial, controlled by Berkshire but only 48% owned-are included via a one-line entry in the owner's Statement of Earnings. Unlike the over-50% category, all items of revenue and expense are omitted; just the proportional share of net income is included. Thus, if Corporation A owns one-third of Corporation B, one-third of B's earnings, whether or not distributed by B, will end up in A's earnings. There are some modifications, both in this and the over-50% category, for intercorporate taxes and purchase price adjustments, the explanation of which we will save for a later day. (We know you can hardly wait.)

Finally come holdings representing less than 20% ownership of another corporation's voting securities. In these cases, accounting rules dictate that the owning companies include in their earnings only dividends received from such holdings. Undistributed earnings are ignored. Thus, should we own 10% of Corporation X with earnings of $10 million in 1980, we would report in our earnings (ignoring relatively minor taxes on intercorporate dividends) either (a) $1 million if X declared the full $10 million in dividends; (b) $500,000 if X paid out 50%, or $5 million, in dividends; or (c) zero if X reinvested all earnings.

We impose this short-and over-simplified-course in accounting upon you because Berkshire's concentration of resources in the insurance field produces a corresponding concentration of its assets in companies in that third (less than 20% owned) category. Many of these companies payout relatively small proportions of their earnings in dividends. This means that only a small proportion of their current earning power is recorded in our own current operating earnings. But, while our reported operating earnings reflect only the dividends received from such companies, our economic well-being is determined by their earnings, not their dividends.

Our holdings in this third category of companies have increased dramatically in recent years as our insurance business has prospered and as securities markets have presented particularly attractive opportunities in the common stock area. The large increase in such holdings, plus the growth of earnings experienced by those partially-owned companies, has produced an unusual result; the part of "our" earnings that these companies retained last year (the part not paid to us in dividends) exceeded the total reported

annual operating earnings of Berkshire Hathaway. Thus, conventional accounting only allows less than half of our earnings "iceberg" to appear above the surface, in plain view. Within the corporate world such a result is quite rare; in our case it is likely to be recurring.

Our own analysis of earnings reality differs somewhat from generally accepted accounting principles, particularly when those principles must be applied in a world of high and uncertain rates of inflation. (But it's much easier to criticize than to improve such accounting rules. The inherent problems are monumental.) We have owned 100% of businesses whose reported earnings were not worth close to 100 cents on the dollar to us even though, in an accounting sense, we totally controlled their disposition. (The "control" was theoretical. Unless we reinvested all earnings, massive deterioration in the value of assets already in place would occur. But those reinvested earnings had no prospect of earning anything close to a market return on capital.) We have also owned small fractions of businesses with extraordinary reinvestment possibilities whose retained earnings had an economic value to us far in excess of 100 cents on the dollar.

The value to Berkshire Hathaway of retained earnings is not determined by whether we own 100%, 50%, 20% or 1% *of the businesses in which they reside. Rather, the value of those retained earnings is determined by the use to which they are put and the subsequent level of earnings produced by that usage.* This is true whether we determine the usage, or whether managers we did not hire-but did elect to join-determine that usage. (It's the act that counts, not the actors.) And the value is in no way affected by the inclusion or non-inclusion of those retained earnings in our own reported operating earnings. If a tree grows in a forest partially owned by us, but we don't record the growth in our financial statements, we still own part of the tree.

Our view, we warn you, is non-conventional. But we would rather have earnings for which we did not get accounting credit put to good use in a 10%-owned company by a management we did not personally hire, than have earnings for which we did get credit put into projects of more dubious potential by another management-even if we are that management.

(We can't resist pausing here for a short commercial. One usage of retained earnings we often greet with special enthusiasm when practiced by companies in which we have an investment interest is repurchase of their own shares. The reasoning is simple: if

a fine business is selling in the market place for far less than intrinsic value, what more certain or more profitable utilization of capital can there be than significant enlargement of the interests of all owners at that bargain price? The competitive nature of corporate acquisition activity almost guarantees the payment of a full-frequently more than full-price when a company buys the entire ownership of another enterprise. But the auction nature of security markets often allows finely-run companies the opportunity to purchase portions of their own businesses at a price under 50% of that needed to acquire the same earning power through the negotiated acquisition of another enterprise.)

The term "earnings" has a precise ring to it. And when an earnings figure is accompanied by an unqualified auditor's certificate, a naive reader might think it comparable in certitude to 1t, calculated to dozens of decimal places.

In reality, however, earnings can be as pliable as putty when a charlatan heads the company reporting them. Eventually truth will surface, but in the meantime a lot of money can change hands. Indeed, some important American fortunes have been created by the monetization of accounting mirages.

Funny business in accounting is not new. For connoisseurs of chicanery, [consider the foregoing satire written by Ben Graham in 1936]. Alas, excesses similar to those he then lampooned have many times since found their way into the financial statements of major American corporations and been duly certified by big-name auditors. Clearly, investors must always keep their guard up and use accounting numbers as a beginning, not an end, in their attempts to calculate true "economic earnings" accruing to them.

Berkshire's own reported earnings are misleading in a different, but important, way: We have huge investments in companies ("investees") whose earnings far exceed their dividends and in which we record our share of earnings only to the extent of the dividends we receive. The extreme case is Capital *Cities*/ABC, Inc. Our 17% share of the company's earnings amounted to more than $83 million last year. Yet only about $530,000 ($600,000 of dividends it paid us less some $70,000 of tax) is counted in Berkshire's GAAP earnings. The residual $82 million-plus stayed with Cap Cities as retained earnings, which work for our benefit but go unrecorded on our books.

Our perspective on such "forgotten-but-not-gone" earnings is simple: The way they are accounted for is of no importance, but

their ownership and subsequent utilization is all-important. We care not whether the auditors hear a tree fall in the forest; we do care who owns the tree and what's next done with it.

When Coca-Cola uses retained earnings to repurchase its shares, the company increases our percentage ownership in what I regard to be the most valuable franchise in the world. (Coke also, of course, uses retained earnings in many other value-enhancing ways.) Instead of repurchasing stock, Coca-Cola could pay those funds to us in dividends, which we could then use to purchase more Coke shares. That would be a less efficient scenario: Because of taxes we would pay on dividend income, we would not be able to increase our proportionate ownership to the degree that Coke can, acting for us. If this less efficient procedure were followed, however, Berkshire would report far greater "earnings."

I believe the best way to think about our earnings is in terms of "look-through" results, calculated as follows: Take $250 million, which is roughly our share of the 1990 operating earnings retained by our investees; subtract $30 million, for the incremental taxes we would have owed had that $250 million been paid to us in dividends; and add the remainder, $220 million, to our reported operating earnings of $371 million. Thus our 1990 "look-through earnings" were about $590 million.

In our view, the value to all owners of the retained earnings of a business enterprise is determined by the effectiveness with which those earnings are used-and not by the size of one's ownership percentage. If you have owned .01 of 1% of Berkshire during the past decade, you have benefited economically in full measure from your share of our retained earnings, no matter what your accounting system. Proportionately, you have done just as well as if you had owned the magic 20%. But if you have owned 100% of a great many capital-intensive businesses during the decade, retained earnings that were credited fully and with painstaking precision to you under standard accounting methods have resulted in minor or zero economic value. This is not a criticism of accounting procedures. We would not like to have the job of designing a better system. It's simply to say that managers and investors alike must understand that accounting numbers are the beginning, not the end, of business valuation.

In most corporations, less-than-20% ownership positions are unimportant (perhaps, in part, because they prevent maximization of cherished reported earnings) and the distinction between ac-

counting and economic results we have just discussed matters little. But in our own case, such positions are of very large and growing importance. Their magnitude, we believe, is what makes our reported operating earnings figure of limited significance.

Within [the] gigantic auction arena [composed of the entire array of major American corporations], it is our job to select businesses with economic characteristics allowing each dollar of retained earnings to be translated eventually into at least a dollar of market value. Despite a lot of mistakes, we have so far achieved this goal. In doing so, we have been greatly assisted by Arthur Okun's patron saint for economists-St. Offset. In some cases, that is, retained earnings attributable to our ownership position have had insignificant or even negative impact on market value, while in other major positions a dollar retained by an investee corporation has been translated into two or more dollars of market value. To date, our corporate over-achievers have more than offset the laggards. If we can continue this record, it will validate our efforts to maximize "economic" earnings, regardless of the impact upon "accounting" earnings.

We also believe that investors can benefit by focusing on their own look-through earnings. To calculate these, they should determine the underlying earnings attributable to the shares they hold in their portfolio and total these. The goal of each investor should be to create a portfolio (in effect, a "company") that will deliver him or her the highest possible look-through earnings a decade or so from now.

An approach of this kind will force the investor to think about long-term business prospects rather than short-term stock market prospects, a perspective likely to improve results. It's true, of course, that, in the long run, the scoreboard for investment decisions is market price. But prices will be determined by future earnings. In investing, just as in baseball, to put runs on the scoreboard one must watch the playing field, not the scoreboard.

The primary test of managerial economic performance is the achievement of a high earnings rate on equity capital employed (without undue leverage, accounting gimmickry, etc.) and not the achievement of consistent gains in earnings per share. In our view, many businesses would be better understood by their shareholder owners, as well as the general public, if managements and financial

analysts modified the primary emphasis they place upon earnings per share, and upon yearly changes in that figure.

C. *Economic Goodwill Versus Accounting Goodwill*[47]

[O]ur intrinsic business value considerably exceeds book value. There are two major reasons:

(1) Standard accounting principles require that common stocks held by our insurance subsidiaries be stated on our books at market value, but that other stocks we own be carried at the lower of aggregate cost or market. At the end of 1983, the market value of this latter group exceeded carrying value by $70 million pre-tax, or about $50 million after tax. This excess belongs in our intrinsic business value, but is not included in the calculation of book value;

(2) More important, we own several businesses that possess economic Goodwill (which is properly includable in intrinsic business value) far larger than the accounting Goodwill that is carried on our balance sheet and reflected in book value.

You can live a full and rewarding life without ever thinking about Goodwill and its amortization. But students of investment and management should understand the nuances of the subject. My own thinking has changed drastically from 35 years ago when I was taught to favor tangible assets and to shun businesses whose value depended largely upon economic Goodwill. This bias caused me to make many important business mistakes of omission, although relatively few of commission.

Keynes identified my problem: "The difficulty lies not in the new ideas but in escaping from the old ones." My escape was long delayed, in part because most of what I had been taught by the same teacher had been (and continues to be) so extraordinarily valuable. Ultimately, business experience, direct and vicarious, produced my present strong preference for businesses that possess large amounts of enduring Goodwill and that utilize a minimum of tangible assets.

I recommend the [following essay] to those who are comfortable with accounting terminology and who have an interest in understanding the business aspects of Goodwill. Whether or not you

47 [Divided by hash lines: 1983; 1983 Appendix; 1996 Owner's Manual.]

wish to tackle the [essay] you should be aware that Charlie and I believe that Berkshire possesses very significant economic Goodwill value above that reflected in our book value.

[The following discussion] deals only with economic and accounting Goodwill-not the goodwill of everyday usage. For example, a business may be well liked, even loved, by most of its customers but possess no economic goodwill. (AT&T, before the breakup, was generally well thought of, but possessed not a dime of economic Goodwill.) And, regrettably, a business may be disliked by its customers but possess substantial, and growing economic Goodwill. So, just for the moment, forget emotions and focus only on economics and accounting.

When a business is purchased, accounting principles require that the purchase price first be assigned to the fair value of the identifiable assets that are acquired. Frequently the sum of the fair values put on the assets (after the deduction of liabilities) is less than the total purchase price of the business. In that case, the difference is assigned to an asset entitled "excess of cost over equity in net assets acquired". To avoid constant repetition of this mouthful, we will substitute "Goodwill."

Accounting Goodwill arising from businesses purchased before November 1970 has a special standing. Except under rare circumstances, it can remain an asset on the balance sheet as long as the business bought is retained. That means no amortization charges to gradually extinguish that asset need be made against earnings.

The case is different, however, with purchases made from November 1970 on. When these create Goodwill, it must be amortized over not more than 40 years through charges-of equal amount in every year-to the earnings account. Since 40 years is the maximum period allowed, 40 years is what managements (including us) usually elect. This annual charge to earnings is not allowed as a tax deduction and, thus, has an effect on after-tax income that is roughly double that of most other expenses.[48]

That's how accounting Goodwill works. To see how it differs from economic reality, let's look at an example elose at hand. We'll round some figures, and greatly oversimplify, to make the example easier to follow. We'll also mention some implications for investor and manager.

---

48 [The tax rule has changed. *See* I.R.c. § 197.]

Blue Chip Stamps bought See's early in 1972 for $25 million, at which time See's had about $8 million of net tangible assets. (Throughout this discussion, accounts receivable will be classified as tangible assets, a definition proper for business analysis.) This level of tangible assets was adequate to conduct the business without use of debt, except for short periods seasonally. See's was earning about $2 million after tax at the time, and such earnings seemed conservatively representative of future earning power in constant 1972 dollars.

Thus our first lesson: businesses logically are worth far more than net tangible assets when they can be expected to produce earnings on such assets considerably in excess of market rates of return. The capitalized value of this excess return is economic Goodwill.

In 1972 (and now) relatively few businesses could be expected to consistently earn the 25% after tax on net tangible assets that was earned by See's-doing it, furthermore, with conservative accounting and no financial leverage. It was not the fair market value of the inventories, receivables or fixed assets that produced the premium rates of return. Rather it was a combination of intangible assets, particularly a pervasive favorable reputation with consumers based upon countless pleasant experiences they have had with both product and personnel.

Such a reputation creates a consumer franchise that allows the value of the product to the purchaser, rather than its production cost, to be the major determinant of selling price. Consumer franchises are a prime source of economic Goodwill. Other sources include governmental franchises not subject to profit regulation, such as television stations, and an enduring position as the low cost producer in an industry.

Let's return to the accounting in the See's example. Blue Chip's purchase of See's at $17 million over net tangible assets required that a Goodwill account of this amount be established as an asset on Blue Chip's books and that $425,000 be charged to income annually for 40 years to amortize that asset. By 1983, after 11 years of such charges, the $17 million had been reduced to about $12.5 million. Berkshire, meanwhile, owned 60% of Blue Chip and, therefore, also 60% of See's. This ownership meant that Berkshire's balance sheet reflected 60% of See's Goodwill, or about $7.5 million.

In 1983 Berkshire acquired the rest of Blue Chip in a merger that required purchase accounting as contrasted to the "pooling"

treatment allowed for some mergers. Under purchase accounting, the "fair value" of the shares we gave to (or "paid") Blue Chip holders had to be spread over the net assets acquired from Blue Chip. This "fair value" was measured, as it almost always is when public companies use their shares to make acquisitions, by the market value of the shares given up.

The assets "purchased" consisted of 40% of everything owned by Blue Chip (as noted, Berkshire already owned the other 60%). What Berkshire "paid" was more than the net identifiable assets we received by $51.7 million, and was assigned to two pieces of Goodwill: $28.4 million to See's and $23.3 million to Buffalo Evening News.

After the merger, therefore, Berkshire was left with a Goodwill asset for See's that had two components: the $7.5 million remaining from the 1971 purchase, and $28.4 million newly created by the 40% "purchased" in 1983. Our amortization charge now will be about $1.0 million for the next 28 years, and $.7 million for the following 12 years, 2002 through 2013.

In other words, different purchase dates and prices have given us vastly different asset values and amortization charges for two pieces of the same asset. (We repeat our usual disclaimer: we have no better accounting system to suggest. The problems to be dealt with are mind boggling and require arbitrary rules.)

But what are the economic realities? One reality is that the amortization charges that have been deducted as costs in the earnings statement each year since acquisition of See's were not true economic costs. We know that because See's last year earned $13 million after taxes on about $20 million of net tangible assets-a performance indicating the existence of economic Goodwill far larger than the total original cost of our accounting Goodwill. In other words, while accounting Goodwill regularly decreased from the moment of purchase, economic Goodwill increased in irregular but very substantial fashion.

Another reality is that annual amortization charges in the future will not correspond to economic costs. It is possible, of course, that See's economic Goodwill will disappear. But it won't shrink in even decrements or anything remotely resembling them. What is more likely is that the Goodwill will increase-in current, if not in constant, dollars-because of inflation.

That probability exists because true economic Goodwill tends to rise in nominal value proportionally with inflation. To illustrate how this works, let's contrast a See's kind of business with a more

mundane business. When we purchased See's in 1972, it will be recalled, it was earning about $2 million on $8 million of net tangible assets. Let us assume that our hypothetical mundane business then had $2 million of earnings also, but needed $18 million in net tangible assets for normal operations. Earning only 11% on required tangible assets, that mundane business would possess little or no economic Goodwill.

A business like that, therefore, might well have sold for the value of its net tangible assets, or for $18 million. In contrast, we paid $25 million for See's, even though it had no more in earnings and less than half as much in "honest-to-God" assets. Could less really have been more, as our purchase price implied? The answer is *"yes"-even if both businesses were expected to have fiat unit volume-as* long as you anticipated, as we did in 1972, a world of continuous inflation.

To understand why, imagine the effect that a doubling of the price level would subsequently have on the two businesses. Both would need to double their nominal earnings to $4 million to keep themselves even with inflation. This would seem to be no great trick: just sell the same number of units at double earlier prices and, assuming profit margins remain unchanged, profits also must double.

But, crucially, to bring that about, both businesses probably would have to double their nominal investment in net tangible assets, since that is the kind of economic requirement that inflation usually imposes on businesses, both good and bad. A doubling of dollar sales means correspondingly more dollars must be employed immediately in receivables and inventories. Dollars employed in fixed assets will respond more slowly to inflation, but probably just as surely. And all of this inflation-required investment will produce no improvement in rate of return. The motivation for this investment is the survival of the business, not the prosperity of the owner.

Remember, however, that See's had net tangible assets of only $8 million. So it would only have had to commit an additional $8 million to finance the capital needs imposed by inflation. The mundane business, meanwhile, had a burden over twice as large-a need for $18 million of additional capital.

After the dust had settled, the mundane business, now earning $4 million annually, might still be worth the value of its tangible assets, or $36 million. That means its owners would have gained only a dollar of nominal value for every new dollar invested. (This

is the same dollar-for-dollar result they would have achieved if they had added money to a savings account.)

See's, however, also earning $4 million, might be worth $50 million *if* valued (as *it logically would* be) on *the same basis* as *it* was at the *time* of our purchase. So it *would* have *gained* $25 *million* in nominal value while the owners were putting up only $8 million in additional capital-over $3 of nominal value gained for each $1 invested.

Remember, even so, that the owners of the See's kind of business were forced by inflation to ante up $8 million in additional capital just to stay even in real profits. Any unleveraged business that requires some net tangible assets to operate (and almost all do) is hurt by inflation. Businesses needing little in the way of tangible assets simply are hurt the least.

And that fact, of course, has been hard for many people to grasp. For years the traditional wisdom-long on tradition, short on wisdom-held that inflation protection was best provided by businesses laden with natural resources, plants and machinery, or other tangible assets ("In Goods We Trust"). It doesn't work that way. Asset-heavy businesses generally earn low rates of return-rates that often barely provide enough capital to fund the inflationary needs of the existing business, with nothing left over for real growth, for distribution to owners, or for acquisition of new businesses.

In contrast, a disproportionate number of the great business fortunes built up during the inflationary years arose from ownership of operations that combined intangibles of lasting value with relatively minor requirements for tangible assets. In such cases earnings have bounded upward in nominal dollars, and these dollars have been largely available for the acquisition of additional businesses. This phenomenon has been particularly evident in the communications business. That business has required little in the way of tangible investment-yet its franchises have endured. During inflation, Goodwill is the gift that keeps giving.

But that statement applies, naturally, only to true economic Goodwill. Spurious accounting Goodwill-and there is plenty of it around-is another matter. When an overexcited management purchases a business at a silly price, the same accounting niceties described earlier are observed. Because it can't go anywhere else, the silliness ends up in the Goodwill account. Considering the lack of managerial discipline that created the account, under such circumstances it might better be labeled "No-Will". Whatever the

term, the 40-year *ritual typically* is observed and the *adrenalin* so capitalized remains on the books as an "asset" just as if the acquisition had been a sensible one.

* * * * *

If you cling to any belief that accounting treatment of Goodwill is the best measure of economic reality, I suggest one final item to ponder.

Assume a company with $20 per share of net worth, all tangible assets. Further assume the company has internally developed some magnificent consumer franchise, or that it was fortunate enough to obtain some important television stations by original FCC grant. Therefore, it earns a great deal on tangible assets, say $5 per share, or 25%.

With such economics, it might sell for $100 per share or more, and it might well also bring that price in a negotiated sale of the entire business.

Assume an investor buys the stock at $100 per share, paying in effect $80 per share for Goodwill Gust as would a corporate purchaser buying the whole company). Should the investor impute a $2 per share amortization charge annually ($80 divided by 40 years) to calculate "true" earnings per share? And, if so, should the new "true" earnings of $3 per share cause him to rethink his purchase price?

* * * * *

We believe managers and investors alike should view intangible assets from two perspectives:

(1) In analysis of operating results-that is, in evaluating the underlying economics of a business unit-amortization charges should be ignored. What a business can be expected to earn on unleveraged net tangible assets, excluding any charges against earnings for amortization of Goodwill, is the best guide to the economic attractiveness of the operation. It is also the best guide to the current value of the operation's economic Goodwill.

(2) In evaluating the wisdom of business acquisitions, amortization charges should be ignored also. They should be deducted neither from earnings nor from the cost of the business. This means forever viewing purchased Goodwill at its full cost, before any amortization. Furthermore, cost should be defined as including the full intrinsic business

> value-not just the recorded accounting value-of all consideration given, irrespective of market prices of the securities involved at the time of merger and irrespective of whether pooling treatment was allowed. For example, what we truly paid in the Blue Chip merger for 40% of the Goodwill of See's and the News was considerably more than the $51.7 million entered on our books. This disparity exists because the market value of the Berkshire shares given up in the merger was less than their intrinsic business value, which is the value that defines the true cost to us.

Operations that appear to be winners based upon perspective (1) may pale when viewed from perspective (2). A good business is not always a good purchase-although it's a good place to look for one.

When Berkshire buys a business for a premium over the GAAP net worth of the acquiree-as will usually be the case, since most companies we'd want to buy don't come at a discount-that premium has to be entered on the asset side of our balance sheet. There are loads of rules about just how a company should record the premium. But to simplify this discussion, we will focus on "Goodwill," the asset item to which almost all of Berkshire's acquisition premiums have been allocated. For example, when we recently acquired the half of GEICO we didn't previously own, we recorded goodwill of about $1.6 billion.

GAAP requires Goodwill to be amortized-that is, written off-over a period no longer than 40 years. Therefore, to extinguish our $1.6 billion in GEICO Goodwill, we will annually take charges of about $40 million against our earnings. This amount is not deductible for tax purposes, so it reduces both our pre-tax and after-tax earnings by $40 million.[49]

In an accounting sense, consequently, our GEICO Goodwill will disappear gradually in even-sized bites. But the one thing I can guarantee you is that the *economic* Goodwill we have purchased at GEICO will not decline in the same measured way. In fact, my best guess is that the economic goodwill assignable to GEICO will not decline at all, but rather will increase-and probably in a very substantial way.

---

49 [The tax rule has changed. *See* I.R.C. § 197.]

I made a similar statement in our 1983 Annual Report about the Goodwill attributed to See's Candy, when I used that company as an example in a discussion of Goodwill accounting. At that time, our balance sheet carried about $36 million of See's Goodwill. We have since been charging about $1 million against earnings every year in order to amortize the asset, and the See's Goodwill on our balance sheet is now down to about $23 million. In other words, from an accounting standpoint, See's is now presented as having lost a good deal of goodwill since 1983.

The economic facts could not be more different. In 1983, See's earned about $27 million pre-tax on $11 million of net operating assets; in 1995 it earned $50 million on only $5 million of net operating assets. Clearly See's economic Goodwill has increased dramatically during the interval rather than decreased. Just as clearly, See's is worth many hundreds of millions of dollars more than its stated value on our books.

We could, of course, be wrong, but we expect GEICO's gradual loss of accounting value to be paired with increases in its economic value. Certainly that has been the pattern at most of our subsidiaries, not just See's. That is why we regularly present our operating earnings in a way that allows you to ignore all purchase-accounting adjustments.

In the future, also, we will adopt a similar policy for look-through earnings, moving to a form of presentation that rids these earnings of the major purchase-accounting adjustments of investees. We will not apply this policy to companies that have only small amounts of goodwill on their books, such as Coca-Cola or Gillette. We will extend it, however, to Wells Fargo and Disney, which have both recently made huge acquisitions and are consequently dealing with exceptionally large goodwill charges.

Before leaving this subject, we should issue an important warning: Investors are often led astray by CEOs and Wall Street analysts who equate depreciation charges with the amortization charges we have just discussed. In no way are the two the same: With rare exceptions, depreciation is an economic cost every bit as real as wages, materials, or taxes. Certainly that is true at Berkshire and at virtually all the other businesses we have studied. Furthermore, we do *not* think so-called EBITDA (earnings before interest, taxes, depreciation and amortization) is a meaningful measure of performance. Managements that dismiss the importance of depreciation-and emphasize "cash flow" or EBITDA-

are apt to make faulty decisions, and you should keep that in mind as you make your own investment decisions.

D. *Owner Earnings and the Cash Flow Fallacy*[50]

[Many business acquisitions require] major purchase-price accounting adjustments, as prescribed by generally accepted accounting principles (GAAP). The GAAP figures, of course, are the ones used in our consolidated financial statements. But, in our view, the GAAP figures are not necessarily the most useful ones for investors or managers. Therefore, the figures shown for specific operating units are earnings before purchase-price adjustments are taken into account. In effect, these are the earnings that would have been reported by the businesses if we had not purchased them.

A discussion of our reasons for preferring this form of presentation [follows. It] will never substitute for a steamy novel and definitely is not required reading. However, I know that among our 6,000 shareholders there are those who are thrilled by my essays on accounting-and I hope that both of you enjoy [it].

First a short quiz: below are abbreviated 1986 statements of earnings for two companies. Which business is the more valuable?

50 [Divided by hash lines: 1986; 1986 Appendix]

		Company 0		Company N
			(000s Omitted)	
Revenues		$677,240		$677,240
Cost of Goods Sold:				
Historical costs, excluding depreciation	$341,170		$341,170	
Special non-cash inventory costs			4,979(1)	
Depreciation of plant and equipment	8,301		13,355(2)	
		349,471		359,504
Gross Profit		$327,769		$317,736
Selling & Admin. Expense	$260,286		$260,286	
Amortization of Goodwill			595(3)	
		260,286		260,881
Operating Profit		$ 67,483		$ 56,855
Other Income, Net		4,135		4,135
Pre-Tax Income		$ 71,618		$ 60,990
Applicable Income Tax:				
Historical deferred and current tax	$ 31,387		$ 31,387	
Non-Cash Inter-period Allocation Adjustment			998(4)	
		31,387		32,385
Net Income		$ 40,231		$ 28,605

(Numbers (1) through (4) designate items discussed later in this section.)

As you've probably guessed, Companies 0 and N are the same business-Scott Fetzer. In the "0" (for "old") column we have shown what the company's 1986 GAAP earnings would have been if we had not purchased it; in the "N" (for "new") column we have shown Scott Fetzer's GAAP earnings as actually reported by Berkshire.

It should be emphasized that the two columns depict identical economics-i.e., the same sales, wages, taxes, etc. And both "companies" generate the same amount of cash for owners. Only the accounting is different.

So, fellow philosophers, which column presents truth? Upon which set of numbers should managers and investors focus?

Before we tackle those questions, let's look at what produces the disparity between 0 and N. We will simplify our discussion in some respects, but the simplification should not produce any inaccuracies in analysis or conclusions.

The contrast between 0 and N comes about because we paid an amount for Scott Fetzer that was different from its stated net worth. Under GAAP, such differences-such premiums or discounts-must be accounted for by "purchase-price adjustments." In Scott Fetzer's case, we paid $315 million for net assets that were

carried on its books at $172.4 million. So we paid a premium of $142.6 million.

The first step in accounting for any premium paid is to adjust the carrying value of current assets to current values. In practice, this requirement usually does not affect receivables, which are routinely carried at current value, but often affects inventories. Because of a $22.9 million LIFO reserve and other accounting intricacies,s1 Scott Fetzer's inventory account was carried at a $37.3 million discount from current value. *So,* making our first accounting move, we used $37.3 million of our $142.6 million premium to increase the carrying value of the inventory.

Assuming any premium is left after current assets are adjusted, the next step is to adjust fixed assets to current value. In our case, this adjustment also required a few accounting acrobatics relating to deferred taxes. Since this has been billed as a simplified discussion, I will skip the details and give you the bottom line: $68.0 million was added to fixed assets and $13.0 million was eliminated from deferred tax liabilities. After making this $81.0 million adjustment, we were left with $24.3 million of premium to allocate.

Had our situation called for them, two steps would next have been required: the adjustment of intangible assets other than Goodwill to current fair values, and the restatement of liabilities to current fair values, a requirement that typically affects only long-term debt and unfunded pension liabilities. In Scott Fetzer's case, however, neither of these steps was necessary.

The final accounting adjustment we needed to make, after recording fair market values for all assets and liabilities, was the assignment of the residual premium to Goodwill (technically known as "excess of cost over the fair value of net assets acquired"). This residual amounted to $24.3 million. Thus, the balance sheet of Scott Fetzer immediately before the acquisition, which is summarized below in column O, was transformed by the purchase into the balance sheet shown in column N. In real terms, both balance sheets depict the same assets and liabilities-but, as you can see, certain figures differ significantly.

---

51 [A LIFO reserve is the difference between the current cost to replace inventory and the amount shown as the cost of inventory on a balance sheet. This difference can grow significantly, especially during inflationary periods.]

	Company O	Company N
	(000s Omitted)	
Assets		
Cash and Cash Equivalents	$ 3,593	$ 3,593
Receivables, net	90,919	90,919
Inventories	77,489	114,764
Other	5,954	5,954
Total Current Assets	177,955	215,230
Property, Plant, and Equipment, net	80,967	148,960
Investments in the Advances to Unconsolidated Subsidiaries and Joint Ventures	93,589	93,589
Other Assets, including Goodwill	9,836	34,210
	$362,347	$491,989
Liabilities		
Notes Payable and Current Portion of Long-term Debt	$ 4,650	$ 4,650
Accounts Payable	39,003	39,003
Accrued Liabilities	84,939	84,939
Total Current Liabilities	128,592	128,592
Long-term Debt and Capitalized Leases	34,669	34,669
Deferred Income Taxes	17,052	4,075
Other Deferred Credits	9,657	9,657
Total Liabilities	189,970	176,993
Shareholder's Equity	172,377	314,996
	$362,347	$491,989

The higher balance sheet figures shown in column N produce the lower income figures shown in column N of the earnings statement presented earlier. This is the result of the asset write-ups and of the fact that some of the written-up assets must be depreciated or amortized. The higher the asset figure, the higher the annual depreciation or amortization charge to earnings must be. The charges that flowed to the earnings statement because of the balance sheet write-ups were numbered in the statement of earnings shown earlier:

1. $4,979,000 for non-cash inventory costs resulting, primarily, from reductions that Scott Fetzer made in its inventories during 1986; charges of this kind are apt to be small or non-existent in future years.
2. $5,054,000 for extra depreciation attributable to the write-up of fixed assets; a charge approximating this amount will probably be made annually for 12 more years.
3. $595,000 for amortization of Goodwill; this charge will be made annually for 39 more years in a slightly larger amount

because our purchase was made on January 6 and, therefore, the 1986 figure applies to only 98% of the year.

4. $998,000 for deferred-tax acrobatics that are beyond my ability to explain briefly (or perhaps even non-briefly); a charge approximating this amount will probably be made annually for 12 more years.

It is important to understand that none of these newly-created accounting costs, totaling $11.6 million, are deductible for income tax purposes.[52] The "new" Scott Fetzer pays exactly the same tax as the "old" Scott Fetzer would have, even though the GAAP earnings of the two entities differ greatly. And, in respect to operating earnings, that would be true in the future also. However, in the unlikely event that Scott Fetzer sells one of its businesses, the tax consequences to the "old" and "new" company might differ widely.

By the end of 1986 the difference between the net worth of the "old" and "new" Scott Fetzer had been reduced from $142.6 million to $131.0 million by means of the extra $11.6 million that was charged to earnings of the new entity. As the years go by, similar charges to earnings will cause most of the premium to disappear, and the two balance sheets will converge. However, the higher land values and most of the higher inventory values that were established on the new balance sheet will remain unless land is disposed of or inventory levels are further reduced.

* * * * *

What does all this mean for owners? Did the shareholders of Berkshire buy a business that earned $40.2 million in 1986 or did they buy one earning $28.6 million? Were those $11.6 million of new charges a real economic cost to us? Should investors pay more for the stock of Company 0 than of Company N? And, if a business is worth some given multiple of earnings, was Scott Fetzer worth considerably more the day before we bought it than it was worth the following day?

If we think through these questions, we can gain some insights about what may be called "owner earnings." These represent (a) reported earnings plus (b) depreciation, depletion, amortization, and certain other non-cash charges such as Company N's items (1) and (4) less (c) the average annual amount of capitalized expenditures for plant and equipment, etc. that the business requires to

52 [The tax rule has changed. *See* I.R.C. § 197.]

fully maintain its long-term competitive position and its unit volume. (If the business requires additional working capital to maintain its competitive position and unit volume, the increment also should be included in (c). However, businesses following the LIFO inventory method usually do not require additional working capital if unit volume does not change.)

Our owner-earnings equation does not yield the deceptively precise figures provided by GAAP, since (c) must be a guess-and one sometimes very difficult to make. Despite this problem, we consider the owner earnings figure, not the GAAP figure, to be the relevant item for valuation purposes-both for investors in buying stocks and for managers in buying entire businesses. We agree with Keynes's observation: "I would rather be vaguely right than precisely wrong."

The approach we have outlined produces "owner earnings" for Company 0 and Company N that are identical, which means valuations are also identical, just as common sense would tell you should be the case. This result is reached because the sum of (a) and (b) is the same in both columns 0 and N, and because (c) is necessarily the same in both cases.

And what do Charlie and I, as owners and managers, believe is the correct figure for the owner earnings of Scott Fetzer? Under current circumstances, we believe (c) is very close to the "old" company's (b) number of $8.3 million and much below the "new" company's (b) number of $19.9 million. Therefore, we believe that owner earnings are far better depicted by the reported earnings in the 0 column than by those in the N column. In other words, we feel owner earnings of Scott Fetzer are considerably larger than the GAAP figures that we report.

That is obviously a happy state of affairs. But calculations of this sort usually do not provide such pleasant news. Most managers probably will acknowledge that they need to spend something more than (b) on their businesses over the longer term just to hold their ground in terms of both unit volume and competitive position. When this imperative exists-that is, when (c) exceeds (b)-GAAP earnings overstate owner earnings. Frequently this overstatement is substantial. The oil industry has in recent years provided a conspicuous example of this phenomenon. Had most major oil companies spent only (b) each year, they would have guaranteed their shrinkage in real terms.

All of this points up the absurdity of the "cash flow" numbers that are often set forth in Wall Street reports. These numbers rou-

tinely include (a) plus (b)-but do not subtract (c). Most sales brochures of investment bankers also feature deceptive presentations of this kind. These imply that the business being offered is the commercial counterpart of the Pyramids-forever state-of-the-art, never needing to be replaced, improved or refurbished. Indeed, if all U.S. corporations were to be offered simultaneously for sale through our leading investment bankers-and if the sales brochures describing them were to be believed-governmental projections of national plant and equipment spending would have to be slashed by 90%.

"Cash Flow," true, may serve as a shorthand of some utility in descriptions of certain real estate businesses or other enterprises that make huge initial outlays and only tiny outlays thereafter. A company whose only holding is a bridge or an extremely long-lived gas field would be an example. But "cash flow" is meaningless in such businesses as manufacturing, retailing, extractive companies, and utilities because, for them, (c) is always significant. To be sure, businesses of this kind may in a given year be able to defer capital spending. But over a five- or ten-year period, they must make the investment-or the business decays.

Why, then, are "cash flow" numbers so popular today? In answer, we confess our cynicism: we believe these numbers are frequently used by marketers of businesses and securities in attempts to justify the unjustifiable (and thereby to sell what should be the unsalable). When (a)-that is, GAAP earnings-looks by itself inadequate to service debt of a junk bond or justify a foolish stock price, how convenient it becomes for salesmen to focus on (a) + (b). But you shouldn't add (b) without subtracting (c): though dentists correctly claim that if you ignore your teeth they'll go away, the same is not true for (c). The company or investor believing that the debt-servicing ability or the equity valuation or an enterprise can be measured by totalling (a) and (b) while ignoring (c) is headed for certain trouble.

* * * * *

To sum up: in the case of both Scott Fetzer and our other businesses, we feel that (b) on an historical-cost basis-i.e., with both amortization of intangibles and other purchase-price adjustments excluded-is quite close in amount to (c). (The two items are not identical, of course. For example, at See's we annually make capitalized expenditures that exceed depreciation by $500,000 to $1 million, simply to hold our ground competitively.) Our conviction

about this point is the reason we show our amortization and other purchase-price adjustment items separately ... and is also our reason for viewing the earnings of the individual businesses . . . as much more closely approximating owner earnings than the GAAP figures.

Questioning GAAP figures may seem impious to some. After all, what are we paying the accountants for if it is not to deliver us the "truth" about our business. But the accountants' job is to record, not to evaluate. The evaluation job falls to investors and managers.

Accounting numbers of course, are the language of business and as such are of enormous help to anyone evaluating the worth of a business and tracking its progress. Charlie and I would be lost without these numbers: they invariably are the starting point for us in evaluating our own businesses and those of others. Managers and owners need to remember, however, that accounting is but an aid to business thinking, never a substitute for it.

E. *Intrinsic Value, Book Value, and Market Price*[53]

[Intrinsic value is] an all-important concept that offers the only logical approach to evaluating the relative attractiveness of investments and businesses. Intrinsic value can be defined simply: It is the discounted value of the cash that can be taken out of a business during its remaining life.

The calculation of intrinsic value, though, is not so simple. As our definition suggests, intrinsic value is an estimate rather than a precise figure, and it is additionally an estimate that must be changed if interest rates move or forecasts of future cash flows are revised. Two people looking at the same set of facts, moreover-and this would apply even to Charlie and me-will almost inevitably come up with at least slightly different intrinsic value figures. That is one reason we never give you our estimates of intrinsic value. What our annual reports do supply, though, are the facts that we ourselves use to calculate this value.

Meanwhile, we regularly report our per-share book value, an easily calculable number, though one of limited use. The limitations do not arise from our holdings of marketable securities, which are carried on our books at their current prices. Rather the inadequacies of book value have to do with the companies we control,

---

53 [Divided by hash lines: 1996 Owner's Manual; 1987; 1985; 1996.]

whose values as stated on our books may be far different from their intrinsic values.

The disparity can go in either direction. For example, in 1964 we could state with certitude that Berkshire's per-share book value was $19.46. However, that figure considerably overstated the company's intrinsic value, since all of the company's resources were tied up in a sub-profitable textile business. Our textile assets had neither going-concern nor liquidation values equal to their carrying values. Today, however, Berkshire's situation is reversed: Our March 31, 1996 book value of $15,180 *far* understates Berkshire's intrinsic value, a point true because many of the businesses we control are worth much more than their carrying value.

Inadequate though they are in telling the story, we give you Berkshire's book-value figures because they today serve as a rough, albeit significantly understated, tracking measure for Berkshire's intrinsic value. In other words, the percentage change in book value in any given year is likely to be reasonably close to that year's change in intrinsic value.

You can gain some insight into the differences between book value and intrinsic value by looking at one form of investment, a college education. Think of the education's cost as its "book value." If this cost is to be accurate, it should include the earnings that were foregone by the student because he chose college rather than a job.

For this exercise, we will ignore the important non-economic benefits of an education and focus strictly on its economic value. First, we must estimate the earnings that the graduate will receive over his lifetime and subtract from that figure an estimate of what he would have earned had he lacked his education. That gives us an excess earnings figure, which must then be discounted, at an appropriate interest rate, back to graduation day. The dollar result equals the intrinsic economic value of the education.

Some graduates will find that the book value of their education exceeds its intrinsic value, which means that whoever paid for the education didn't get his money's worth. In other cases, the intrinsic value of an education will far exceed its book value, a result that proves capital was wisely deployed. In all cases, what is clear is that book value is meaningless as an indicator of intrinsic value.

An interesting accounting irony overlays a comparison of the reported financial results of our controlled companies with those of

the permanent minority holdings . . .. [These holdings] have a market value of over $2 billion. Yet they produced only $11 million in reported after-tax earnings for Berkshire in 1987.

Accounting rules dictate that we take into income only the dividends these companies pay us-which are little more than nominal-rather than our share of their earnings, which in 1987 amounted to well over $100 million. On the other hand, accounting rules provide that the carrying value of these three holdings-owned, as they are, by insurance companies-must be recorded on our balance sheet at current market prices. The result: GAAP accounting lets us reflect in our net worth the up-to-date underlying values of the businesses we partially own, but does not let us reflect their underlying earnings in our income account.

In the case of our controlled companies, just the opposite is true. Here, we show full earnings in our income account but never change asset values on our balance sheet, no matter how much the value of a business might have increased since we purchased it.

Our mental approach to this accounting schizophrenia is to ignore GAAP figures and to focus solely on the future earning power of both our controlled and non-controlled businesses. Using this approach, we establish our own ideas of business value, keeping these independent from both the accounting values shown on our books for controlled companies and the values placed by a sometimes foolish market on our partially-owned companies. It is this business value that we hope to increase at a reasonable (or, preferably, unreasonable) rate in the years ahead.

Historically, Berkshire shares have sold modestly below intrinsic business value. With the price there, purchasers could be certain (as long as they did not experience a widening of this discount) that their personal investment experience would at least equal the financial experience of the business. But recently the discount has disappeared, and occasionally a modest premium has prevailed.

The elimination of the discount means that Berkshire's market value increased even faster than business value (which, itself, grew at a pleasing pace). That was good news for any owner holding while that move took place, but it is bad news for the new or prospective owner. If the financial experience of new owners of Berkshire is merely to match the future financial experience of the company, any premium of market value over intrinsic business value that they pay must be maintained.

Management cannot determine market prices, although it can, by its disclosures and policies, encourage rational behavior by market participants. My own preference, as perhaps you'd guess, is for a market price that consistently approximates business value. Given that relationship, all owners prosper precisely as the business prospers during their period of ownership. Wild swings in market prices far above and below business value do not change the final gains for owners in aggregate; in the end, investor gains must equal business gains. But long periods of substantial undervaluation and/ or overvaluation will cause the gains of the business to be inequitably distributed among various owners, with the investment result of any given owner largely depending upon how lucky, shrewd, or foolish he happens to be.

Over the long term there has been a more consistent relationship between Berkshire's market value and business value than has existed for any other publicly-traded equity with which I am familiar. This is a tribute to you. Because you have been rational, interested, and investment-oriented, the market price for Berkshire stock has almost always been sensible. This unusual result has been achieved by a shareholder group with unusual demographics: virtually all of our shareholders are individuals, not institutions. No other public company our size can claim the same.

Ben Graham told a story 40 years ago that illustrates why investment professionals behave as they do: An oil prospector, moving to his heavenly reward, was met by St. Peter with bad news. "You're qualified for residence", said St. Peter, "but, as you can see, the compound reserved for oil men is packed. There's no way to squeeze you in." After thinking a moment, the prospector asked if he might say just four words to the present occupants. That seemed harmless to St. Peter, so the prospector cupped his hands and yelled, "Oil discovered in hell." Immediately the gate to the compound opened and all of the oil men marched out to head for the nether regions. Impressed, St. Peter invited the prospector to move in and make himself comfortable. The prospector paused. "No," he said, "I think I'll go along with the rest of the boys. There might be some truth to that rumor after all."

In [the 1995] letter, with Berkshire shares selling at $36,000, I told you: (1) Berkshire's gain in market value in recent years had outstripped its gain in intrinsic value, even though the latter gain had been highly satisfactory; (2) that kind of overperformance

could not continue indefinitely; (3) Charlie and I did not at that moment consider Berkshire to be undervalued.

Since I set down those cautions, Berkshire's intrinsic value has increased very significantly ... while the market price of our shares has changed little. This, of course, means that in 1996 Berkshire's stock underperformed the business. Consequently, today's price/value relationship is both much different from what it was a year ago and, as Charlie and I see it, more appropriate.

Over time, the aggregate gains made by Berkshire shareholders must of necessity match the business gains of the company. When the stock temporarily overperforms or underperforms the business, a limited number of shareholders-either sellers or buyers-receive outsized benefits at the expense of those they trade with. Generally, the sophisticated have an edge over the innocents in this game.

Though our primary goal is to maximize the amount that our shareholders, in total, reap from their ownership of Berkshire, we wish also to minimize the benefits going to some shareholders at the expense of others. These are goals we would have were we managing a family partnership, and we believe they make equal sense for the manager of a public company. In a partnership, fairness requires that partnership interests be valued equitably when partners enter or exit; in a public company, fairness prevails when market price and intrinsic value are in sync. Obviously, they won't always meet that ideal, but a manager-by his policies and communications-can do much to foster equity.

Of course, the longer a shareholder holds his shares, the more bearing Berkshire's business results will have on his financial experience-and the less it will matter what premium or discount to intrinsic value prevails when he buys and sells his stock. That's one reason we hope to attract owners with long-term horizons. Overall, I think we have succeeded in that pursuit. Berkshire probably ranks number one among large American corporations in the percentage of its shares held by owners with a long-term view.

F. *Segment Data and Consolidation*[54]

Despite the shortcomings of [GAAP], I would hate to have the job of devising a better set of rules. The limitations of the existing set, however, need not be inhibiting: CEOs are free to treat GAAP statements as a beginning rather than an end to their obli-

54 [1988.]

gation to inform owners and creditors-and indeed they should. After all, any manager of a subsidiary company would find himself in hot water if he reported barebones GAAP numbers that omitted key information needed by his boss, the parent corporation's CEO. Why, then, should the CEO himself withhold information vitally useful to *his* bosses-the shareholder-owners of the corporation?

What needs to be reported is data-whether GAAP, non-GAAP, or extra-GAAP-that helps financially-literate readers answer three key questions: (1) Approximately how much is this company worth? (2) What is the likelihood that it can meet its future obligations? and (3) How good a job are its managers doing, given the hand they have been dealt?

In most cases, answers to one or more of these questions are somewhere between difficult and impossible to glean from the minimum GAAP presentation. The business world is simply too complex for a single set of rules to effectively describe economic reality for all enterprises, particularly those operating in a wide variety of businesses, such as Berkshire.

Further complicating the problem is the fact that many managements view GAAP not as a standard to be met, but as an obstacle to overcome. Too often their accountants willingly assist them. ("How much," says the client, "is two plus two?" Replies the cooperative accountant, "What number did you have in mind?") Even honest and well-intentioned managements sometimes stretch GAAP a bit in order to present figures they think will more appropriately describe their performance. Both the smoothing of earnings and the "big bath" quarter are "white lie" techniques employed by otherwise upright managements.

Then there are managers who actively use GAAP to deceive and defraud. They know that many investors and creditors accept GAAP results as gospel. So these charlatans interpret the rules "imaginatively" and record business transactions in ways that technically comply with GAAP but actually display an economic illusion to the world.

As long as investors-including supposedly sophisticated institutions-place fancy valuations on reported "earnings" that march steadily upward, you can be sure that some managers and promoters will exploit GAAP to produce such numbers, no matter what the truth may be. Over the years, Charlie and I have observed many accounting-based frauds of staggering size. Few of the perpetrators have been punished; many have not even been censured.

It has been far safer to steal large sums with a pen than small sums with a gun.

Under one major change mandated by GAAP for 1988, we have been required to fully consolidate all our subsidiaries in our balance sheet and earnings statement. In the past, Mutual Savings and Loan, and Scott Fetzer Financial (a credit company that primarily finances installment sales of World Book and Kirby products) were consolidated on a "one-line" basis. That meant we (1) showed our equity in their combined net worths as a single-entry asset on Berkshire's consolidated balance sheet and (2) included our equity in their combined annual earnings as a single-line income entry in our consolidated statement of earnings. Now the rules require that we consolidate each asset and liability of these companies in our balance sheet and each item of their income and expense in our earnings statement.

This change underscores the need for companies also to report segmented data: The greater the number of economically diverse business operations lumped together in conventional financial statements, the less useful those presentations are and the less able investors are to answer the three questions posed earlier. Indeed, the only reason we ever prepare consolidated figures at Berkshire is to meet outside requirements. On the other hand, Charlie and I constantly study our segment data.

Now that we are required to bundle more numbers in our GAAP statements, we have decided to publish additional supplementary information that we think will help you measure both business value and managerial performance. (Berkshire's ability to discharge its obligations to creditors-the third question we listed-should be obvious, whatever statements you examine.) In these supplementary presentations, we will not necessarily follow GAAP procedures, or even corporate structure. Rather, we will attempt to lump major business activities in ways that aid analysis but do not swamp you with detail. Our goal is to give you important information in a form that we would wish to get it if our roles were reversed.

G. *Deferred Taxes*[55]

I referred earlier to a major change in GAAP that is expected in 1990. This change relates to the calculation of deferred taxes,

---

55 [Divided by hash lines: 1988; 1989; 1992.]

and is both complicated and controversial-so much so that its imposition, originally scheduled for 1989, was postponed for a year.

When implemented, the new rule will affect us in various ways. Most important, we will be required to change the way we calculate our liability for deferred taxes on the unrealized appreciation of stocks held by our insurance companies.

Right now, our liability is layered. For the unrealized appreciation that dates back to 1986 and earlier years, $1.2 billion, we have booked a 28% tax liability. For the unrealized appreciation built up since, $600 million, the tax liability has been booked at 34%. The difference reflects the increase in tax rates that went into effect in 1987.

It now appears, however, that the new accounting rule will require us to establish the entire liability at 34% in 1990, taking the charge against our earnings. Assuming no change in tax rates by 1990, this step will reduce our earnings in that year (and thereby our reported net worth) by $71 million. The proposed rule will also affect other items on our balance sheet, but these changes will have only a minor impact on earnings and net worth.

We have no strong views about the desirability of this change in calculation of deferred taxes. We should point out, however, that neither a 28% nor a 34% tax liability precisely depicts economic reality at Berkshire since we have no plans to sell the stocks in which we have the great bulk of our gains.

A new accounting rule is likely to be adopted that will require companies to reserve against all gains at the current tax rate, whatever it may be. With the rate at 34%, such a rule would increase our deferred tax liability, and decrease our net worth, by about $71 million-the result of raising the reserve on our pre-1987 gain by six percentage points. Because the proposed rule has sparked widespread controversy and its final form is unclear, we have not yet made this change.

. . . [W]e would owe taxes of more than $1.1 billion were we to sell all of our securities at year-end market values. Is this $1.1 billion liability equal, or even similar, to a $1.1 billion liability payable to a trade creditor 15 days after the end of the year? Obviously not-despite the fact that both items have exactly the same effect on audited net worth, reducing it by $1.1 billion.

On the other hand, is this liability for deferred taxes a meaningless accounting fiction because its payment can be triggered

only by the sale of stocks that, in very large part, we have no intention of selling? Again, the answer is no.

In economic terms, the liability resembles an interest-free loan from the U.S. Treasury that comes due only at our election (unless, of course, Congress moves to tax gains before they are realized). This "loan" is peculiar in other respects as well: It can be used only to finance the ownership of the particular, appreciated stocks and it fluctuates in size-daily as market prices change and periodically if tax rates change. In effect, this deferred tax liability is equivalent to a very large transfer tax that is payable only if we elect to move from one asset to another. Indeed, we sold some relatively small holdings in 1989, incurring about $76 million of "transfer" tax on $224 million of gains.

Because of the way the tax law works, the Rip Van Winkle style of investing that we favor-if successful-has an important mathematical edge over a more frenzied approach. Let's look at an extreme comparison.

Imagine that Berkshire had only $1, which we put in a security that doubled by yearend and was then sold. Imagine further that we used the after-tax proceeds to repeat this process in each of the next 19 years, scoring a double each time. At the end of the 20 years, the 34% capital gains tax that we would have paid on the profits from each sale would have delivered about $13,000 to the government and we would be left with about $25,250. Not bad. If, however, we made a single fantastic investment that itself doubled 20 times during the 20 years, our dollar would grow to $1,048,576. Were we then to cash out, we would pay a 34% tax of roughly $356,500 and be left with about $692,000.

The *sole* reason for *this* staggering *difference in results would* be the timing of tax payments. Interestingly, the government would gain from Scenario 2 in exactly the same 27:1 ratio as we-taking in taxes of $356,500 verus $13,OOO-though, admittedly, it would have to wait for its money.

We have not, we *should stress, adopted our strategy favoring* long-term investment commitments because of these mathematics. Indeed, it is possible we could earn greater after-tax returns by moving rather frequently from one investment to another. Many years ago, that's exactly what Charlie and I did.

Now we would rather stay put, even if that means slightly lower returns. Our reason is simple: We have found splendid business relationships to be so rare and so enjoyable that we want to retain all we develop. This decision is particularly easy for us be-

cause we feel that these relationships will produce good-though perhaps not optimal-financial results. Considering that, we think it makes little sense for us to give up time with people we know to be interesting and admirable for time with others we do not know and who are likely to have human qualities far closer to average. That would be akin to marrying for money-a mistake under most circumstances, insanity if one is already rich.

A new accounting rule having to do with deferred taxes becomes effective in 1993. It undoes a dichotomy in our books that I have described in previous annual reports and that relates to the accrued taxes carried against the unrealized appreciation in our investment portfolio. At yearend 1992, that appreciation amounted to $7.6 billion. Against $6.4 billion of that, we carried taxes at the current 34% rate. Against the remainder of $1.2 billion, we carried an accrual of 28%, the tax rate in effect when that portion of the appreciation occurred. The new accounting rule says we must henceforth accrue all deferred tax at the current rate, which to us seems sensible.

The new marching orders mean that in the first quarter of 1993 we will apply a 34% rate to all of our unrealized appreciation, thereby increasing the tax liability and reducing net worth by $70 million. The new rule also will cause us to make other minor changes in our calculation of deferred taxes.

Future changes in tax rates will be reflected immediately in the liability for deferred taxes and, correspondingly, in net worth. The impact could well be substantial. Nevertheless, what is important in the end is the tax rate at the time we sell securities, when unrealized appreciation becomes realized.

H. *Retiree Benefits and Stock Options*[56]

Another major accounting change, whose implementation is required by January 1, 1993, mandates that businesses recognize their present-value liability for post-retirement health benefits. Though GAAP has previously required recognition of pensions to be paid in the future, it has illogically ignored the costs that companies will then have to bear for health benefits. The new rule will force many companies to record a huge balance-sheet liability (and a consequent reduction in net worth) and also henceforth to recog-

---

56 [1992.]

nize substantially higher costs when they are calculating annual profits.

In making acquisitions, Charlie and I have tended to avoid companies with significant post-retirement liabilities. As a result, Berkshire's present liability and future costs for post-retirement health benefits-though we now have 22,000 employees-are inconsequential. I need to admit, though, that we had a near miss: In 1982 I made a huge mistake in committing to buy a company burdened by extraordinary post-retirement health obligations. Luckily, though, the transaction fell through for reasons beyond our control. Reporting on this episode in the 1982 annual report, I said: "If we were to introduce graphics to this report, illustrating favorable business developments of the past year, two blank pages depicting this blown deal would be the appropriate centerfold." Even so, I wasn't expecting things to get as bad as they did. Another buyer appeared, the business soon went bankrupt and was shut down, and thousands of workers found those bountiful health-care promises to be largely worthless.

In recent decades, no CEO would have dreamed of going to his board with the proposition that his company become an insurer of uncapped post-retirement health benefits that other corporations chose to install. A CEO didn't need to be a medical expert to know that lengthening life expectancies and soaring health costs would guarantee an insurer a financial battering from such a business. Nevertheless, many a manager blithely committed his own company to a self-insurance plan embodying precisely the same promises-and thereby doomed his shareholders to suffer the inevitable consequences. In health-care, open-ended promises have created open-ended liabilities that in a few cases 100m so large as to threaten the global competitiveness of major American industries.

I believe part of the reason for this reckless behavior was that accounting rules did not, for so long, require the booking of post-retirement health costs as they were incurred. Instead, the rules allowed cash-basis accounting, which vastly understated the liabilities that were building up. In effect, the attitude of both managements and their accountants toward these liabilities was "out-of-sight, out-of-mind." Ironically, some of these same managers would be quick to criticize Congress for employing "cash-basis" thinking in respect to Social Security promises or other programs creating future liabilities of size.

Managers thinking about accounting issues should never forget one of Abraham Lincoln's favorite riddles: "How many legs does a dog have if you call his tail a leg?" The answer: "Four, because calling a tail a leg does not make it a leg." It behooves managers to remember that Abe's right even if an auditor is willing to certify that the tail is a leg.

* * * * *

The most egregious case of let's-not-face-up-to-reality behavior by executives and accountants has occurred in the world of stock options. In Berkshire's 1985 annual report, I laid out my opinions about the use and misuse of options.[57] But even when options are structured properly, they are accounted for in ways that make no sense. The lack of logic is not accidental: For decades, much of the business world has waged war against accounting rulemakers, trying to keep the costs of stock options from being reflected in the profits of the corporations that issue them.

Typically, executives have argued that options are hard to value and that therefore their costs should be ignored. At other times managers have said that assigning a cost to options would injure small start-up businesses. Sometimes they have even solemnly declared that "out-of-the-money" options (those with an exercise price equal to or above the current market price) have no value when they are issued.

Oddly, the Council of Institutional Investors has chimed in with a variation on that theme, opining that options should not be viewed as a cost because they "aren't dollars out of a company's coffers." I see this line of reasoning as offering exciting possibilities to American corporations for instantly improving their reported profits. For example, they could eliminate the cost of insurance by paying for it with options. So if you're a CEO and subscribe to this "no cash-no cost" theory of accounting, I'll make you an offer you can't refuse: Give us a call at Berkshire and we will happily sell you insurance in exchange for a bundle of long-term options on your company's stock.

Shareholders should understand that companies incur costs when they deliver something of value to another party and not just when cash changes hands. Moreover, it is both silly and cynical to say that an important item of cost should not be recognized simply because it can't be quantified with pinpoint precision. Right now,

---

57 *[See* the essay A Principled Approach to Executive Pay in Part I.E.]

accounting abounds with imprecision. After all, no manager or auditor knows how long a 747 is going to last, which means he also does not know what the yearly depreciation charge for the plane should be. No one knows with any certainty what a bank's annual loan loss charge ought to be. And the estimates of losses that property casualty companies make are notoriously inaccurate.

Does this mean that these important items of cost should be ignored simply because they can't be quantified with absolute accuracy? Of course not. Rather, these costs should be estimated by honest and experienced people and then recorded. When you get right down to it, what other item of major but hard-to-precisely-calculate cost-other, that is, than stock options-does the accounting profession say should be ignored in the calculation of earnings?

Moreover, options are just not that difficult to value. Admittedly, the difficulty is increased by the fact that the options given to executives are restricted in various ways. These restrictions affect value. They do not, however, eliminate it. In fact, since I'm in the mood for offers, I'll make one to any executive who is granted a restricted option, even though it may be out of the money: On the day of issue, Berkshire will pay him or her a substantial sum for the right to any future gain he or she realizes on the option. So if you find a CEO who says his newly-issued options have little or no value, tell him to try us out. In truth, we have far more confidence in our ability to determine an appropriate price to pay for an option than we have in our ability to determine the proper depreciation rate for our corporate jet.

It seems to me that the realities of stock options can be summarized quite simply: If options aren't a form of compensation, what are they? If compensation isn't an expense, what is it? And, if expenses shouldn't go into the calculation of earnings, where in the world should they go?

The accounting profession and the SEC should be shamed by the fact that they have long let themselves be muscled by business executives on the option-accounting issue. Additionally, the lobbying that executives engage in may have an unfortunate by-product: In my opinion, the business elite risks losing its credibility on issues of significance to society-about which it may have much of value to say-when *it* advocates the *incredible* on *issues* of *significance* to itself.

1. *Distribution of the Corporate Tax Burden*[58]

The Tax Reform Act of 1986 affects our various businesses in important and divergent ways. Although we find much to praise in the Act, the net financial effect for Berkshire is negative: our rate of increase in business value is likely to be at least moderately slower under the new law than under the old. The net effect for our shareholders is even more negative: every dollar of increase in per-share business value, assuming the increase is accompanied by an equivalent dollar gain in the market value of Berkshire stock, will produce 72¢ of after-tax gain for our shareholders rather than the 80¢ produced under the old law. This result, of course, reflects the rise in the maximum tax rate on personal capital gains from 20% to 28%.

Here are the main tax changes that affect Berkshire:

• The tax rate on corporate ordinary income is scheduled to decrease from 46% in 1986 to 34% in 1988. This change obviously affects us positively-and it also has a significant positive effect on two of our three major investees, Capital Cities/ABC and The Washington Post Company.

I say this knowing that over the years there has been a lot of fuzzy and often partisan commentary about who really pays corporate taxes-businesses or their customers. The argument, of course, has usually turned around tax increases, not decreases. Those people resisting increases in corporate rates frequently argue that corporations in reality pay none of the taxes levied on them but, instead, act as a sort of economic pipeline, passing all taxes through to consumers. According to these advocates, any corporate-tax increase will simply lead to higher prices that, for the corporation, offset the increase. Having taken this position, proponents of the "pipeline" theory must also conclude that a tax decrease for corporations will not help profits but will instead flow through, leading to correspondingly lower prices for consumers.

Conversely, others argue that corporations not only pay the taxes levied upon them, but absorb them also. Consumers, this school says, will be unaffected by changes in corporate rates.

What really happens? When the corporate rate is cut, do Berkshire, The Washington Post, Cap Cities, etc., themselves soak up the benefits, or do these companies pass the benefits along to their customers in the form of lower prices? This is an important question for investors and managers, as well as for policymakers.

---

58 [1986.]

Our conclusion is that in some cases the benefits of lower corporate taxes fall exclusively, or almost exclusively, upon the corporation and its shareholders, and that in other cases the benefits are entirely, or almost entirely, passed through to the customer. What determines the outcome is the strength of the corporation's business franchise and whether the profitability of the franchise is regulated.

For example, when the franchise is strong and after-tax profits are regulated in a relatively precise manner, as is the case with electric utilities, changes in corporate tax rates are largely reflected in prices, not in profits. When taxes are cut, prices will usually be reduced in short order. When taxes are increased, prices will rise, though often not as promptly.

A similar result occurs in a second arena-in the price-competitive industry, whose companies typically operate with very weak business franchises. In such industries, the free market "regulates" after-tax profits in a delayed and irregular, but generally effective, manner. The marketplace, in effect, performs much the same function in dealing with the price-competitive industry as the Public Utilities Commission does in dealing with electric utilities. In these industries, therefore, tax changes eventually affect prices more than profits.

In the case of unregulated businesses blessed with strong franchises, however, it's a different story: the corporation and its shareholders are then the major beneficiaries of tax cuts. These companies benefit from a tax cut much as the electric company would if it lacked a regulator to force down prices.

Many of our businesses, both those we own in whole and in part, possess such franchises. Consequently, reductions in their taxes largely end up in our pockets rather than the pockets of our customers. While this may be impolitic to state, it is impossible to deny. If you are tempted to believe otherwise, think for a moment of the most able brain surgeon or lawyer in your area. Do you really expect the fees of this expert (the local "franchise-holder" in his or her specialty) to be reduced now that the top personal tax rate is being cut from 50% to 28%?

Your joy at our conclusion that lower rates benefit a number of our operating businesses and investees should be severely tempered, however, by another of our convictions: scheduled 1988 tax rates, both individual and corporate, seem totally unrealistic to us. These rates will very likely bestow a fiscal problem on Washington that will prove incompatible with price stability. We believe, there-

fore, that ultimately-within, say, five years-either higher tax rates or higher inflation rates are almost certain to materialize. And it would not surprise us to see both.

• Corporate capital gains tax rates have been increased from 28% to 34%, effective in 1987. This change will have an important adverse effect on Berkshire because we expect much of our gain in business value in the future, as in the past, to arise from capital gains. For example, our three major investment holdings-Cap Cities, GEICO, and Washington Post-at yearend had a market value of over $1.7 billion, close to 75% of the total net worth of Berkshire, and yet they deliver us only about $9 million in annual income. Instead, all three retain a very high percentage of their earnings, which we expect to eventually deliver us capital gains.

The new law increases the rate for all gains realized in the future, including the unrealized gains that existed before the law was enacted. At yearend, we had $1.2 billion of such unrealized gains in our equity investments. The effect of the new law on our balance sheet will be delayed because a GAAP rule stipulates that the deferred tax liability applicable to unrealized gains should be stated at last year's 28% tax rate rather than the current 34% rate. This rule is expected to change soon. The moment it does, about $73 million will disappear from our GAAP net worth and be added to the deferred tax account.

• Dividend and interest income received by our insurance companies will be taxed far more heavily under the new law. First, all corporations will be taxed on 20% of the dividends they receive from other domestic corporations, up from 15% under the old law. Second, there is a change concerning the residual 80% that applies only to property/casualty companies: 15% of that residual will be taxed if the stocks paying the dividends were purchased after August 7, 1986. A third change, again applying only to property/casualty companies, concerns tax-exempt bonds: interest on bonds purchased by insurers after August 7, 1986 will only be 85% tax-exempt.

The last two changes are very important. They mean that our income from the investments we make in future years will be significantly lower than would have been the case under the old law. My best guess is that these changes alone will eventually reduce the earning power of our insurance operation by at least 10% from what we could previously have expected.

• The new tax law also materially changes the timing of tax payments by property/casualty insurance companies. One new rule

requires us to discount our loss reserves in our tax returns, a change that will decrease deductions and increase taxable income. Another rule, to be phased in over six years, requires us to include 20% of our unearned premium reserve in taxable income.

Neither rule changes the amount of the annual tax accrual in our reports to you, but each materially accelerates the schedule of payments. That is, taxes formerly deferred will now be front-ended, a change that will significantly cut the profitability of our business. An analogy will suggest the toll: if, upon turning 21, you were required to immediately pay tax on all income you were due to receive throughout your life, both your lifetime wealth and your estate would be a small fraction of what they would be if all taxes on your income were payable only when you died.

Attentive readers may spot an inconsistency in what we say. Earlier, discussing companies in price-competitive industries, we suggested that tax increases or reductions affect these companies relatively little, but instead are largely passed along to their customers. But now we are saying that tax increases will affect profits of Berkshire's property/casualty companies even though they operate in an intensely price-competitive industry.

The reason this industry is likely to be an exception to our general rule is that not all major insurers will be working with identical tax equations. Important differences will exist for several reasons: a new alternative minimum tax will materially affect some companies but not others; certain major insurers have huge loss carry-forwards that will largely shield their income from significant taxes for at least a few years; and the results of some large insurers will be folded into the consolidated returns of companies with non-insurance businesses. These disparate conditions will produce widely-varying marginal tax rates in the property/casualty industry. That will not be the case, however, in most other price-competitive industries, such as aluminum, autos and department stores, in which the major players will generally contend with similar tax equations.

The absence of a common tax calculus for property/casualty companies means that the increased taxes falling on the industry will probably not be passed along to customers to the degree that they would in a typical price-competitive industry. Insurers, in other words, will themselves bear much of the new tax burdens.

• A partial offset to these burdens is a "fresh start" adjustment that occurred on January 1, 1987 when our December 31, 1986 loss reserve figures were converted for tax purposes to the

newly-required discounted basis. (In our reports to you, however, reserves will remain on exactly the same basis as in the past-undiscounted except in special cases such as structured settlements.) The net effect of the "fresh start" is to give us a double deduction: we will get a tax deduction in 1987 and future years for a portion of our incurred-but-unpaid insurance losses that have already been fully deducted as costs in 1986 and earlier years.

The increase in net worth that is produced by this change is not yet reflected in our financial statements. Rather, under present GAAP rules (which may be changed), the benefit will flow into the earnings statement and, consequently, into net worth over the next few years by way of reduced tax charges. We expect the total benefit from the fresh-start adjustment to be in the $30-$40 million range. It should be noted, however, that this is a one-time benefit, whereas the negative impact of the other insurance-related tax changes is not only ongoing but, in important respects, will become more severe as time passes.

• The General Utilities Doctrine was repealed by the new tax law. This means that in 1987 and thereafter there will be a double tax on corporate liquidations, one at the corporate level and another at the shareholder level. In the past, the tax at the corporate level could be avoided. If Berkshire, for example, were to be liquidated-which it most certainly won't be-shareholders would, under the new law, receive far less from the sales of our properties than they would have if the properties had been sold in the past, assuming identical prices in each sale. Though this outcome is theoretical in our case, the change in the law will very materially affect many companies. Therefore, it also affects our evaluations of prospective investments. Take, for example, producing oil and gas businesses, selected media companies, real estate companies, etc. that might wish to sell out. The values that their shareholders can realize are likely to be significantly reduced simply because the General Utilities Doctrine has been repealed-though the companies' operating economics will not have changed adversely at all. My impression is that this important change in the law has not yet been fully comprehended by either investors or managers.

J. *Taxation and Investment Philosophy*[59]

Berkshire is a substantial payer of federal income taxes. In aggregate, we will pay 1993 federal income taxes of $390 million,

---

59 [1993.]

about $200 million of that attributable to operating earnings and $190 million to realized capital gains.[60] Furthermore, our share of the 1993 federal and foreign income taxes paid by our investees is well over $400 million, a figure you don't see on our financial statements but that is nonetheless real. Directly and indirectly, Berkshire's 1993 federal income tax payments will be about lh of 1% of the total paid last year by all American corporations.

Speaking for our own shares, Charlie and I have absolutely no complaint about these taxes. We know we work in a market-based economy that rewards our efforts far more bountifully than it does the efforts of others whose output is of equal or greater benefit to society. Taxation should, and does, partially redress this inequity. But we still remain extraordinarily well-treated.

Berkshire and its shareholders, in combination, would pay a much smaller tax if Berkshire operated a partnership or "S" corporation, two structures often used for business activities. For a variety of reasons, that's not feasible for Berkshire to do. However, the penalty our corporate form imposes is mitigated-though far from eliminated-by our strategy of investing for the long term. Charlie and I would follow a buy-and-hold policy even if we ran a tax-exempt institution. We think it the soundest way to invest, and it also goes down the grain of our personalities. A third reason to favor this policy, however, is the fact that taxes are due only when gains are realized.

Through my favorite comic strip, Li'l Abner, I got a chance during my youth to see the benefits of delayed taxes, though I missed the lesson at the time. Making his readers feel superior, Li'l Abner bungled happily, but moronically, through life in Dogpatch. At one point he became infatuated with a New York temptress, Appassionatta Van Climax, but despaired of marrying her because he had only a single silver dollar and she was interested solely in millionaires. Dejected, Abner took his problem to Old Man Mose, the font of all knowledge in Dogpatch. Said the sage: Double your money 20 times and Appassionatta will be yours (1, 2, 4, 8 - - - - 1,048,576).

My last memory of the strip is Abner entering a roadhouse, dropping his dollar into a slot machine, and hitting a jackpot that spilled money all over the floor. Meticulously following Mose's advice, Abner picked up two dollars and went off to find his next

60 [For 1996, the figure was $860 million.]

double. Whereupon I dumped Abner and began reading Ben Graham.

Mose clearly was overrated as a guru: Besides failing to anticipate Abner's slavish obedience to instructions, he also forgot about taxes. Had Abner been subject, say, to the 35% federal tax rate that Berkshire pays, and had he managed one double annually, he would after 20 years only have accumulated $22,370. Indeed, had he kept on both getting his annual doubles and paying a 35% tax on each, he would have needed 7½ years more to reach the $1 million required to win Appassionatta.

But what if Abner had instead put his dollar in a single investment and held it until it doubled the same *27¼* times? In that case, he would have realized about $200 million pre-tax or, after paying a $70 million tax in the final year, about $130 million after-tax. For that, Appassionatta would have crawled to Dogpatch. Of course, with *27¼* years having passed, how Appassionatta would have looked to a fellow sitting on $130 million is another question.

What this little tale tells us is that tax-paying investors will realize a far, far greater sum from a single investment that compounds internally at a given rate than from a succession of investments compounding at the same rate. But I suspect many Berkshire shareholders figured that out long ago.

EPILOGUE[61]

We will keep most of our major holdings, regardless of how they are priced relative to intrinsic business value. This 'til-death-do-us-part attitude, combined with the full prices these holdings command, means that they cannot be expected to push up Berkshire's value in the future as sharply as in the past. In other words, our performance to date has benefited from a double-dip: (1) the exceptional gains in intrinsic value that our portfolio companies have achieved; (2) the additional bonus we realized as the market appropriately "corrected" the prices of these companies, raising their valuations in relation to those of the average business. We will continue to benefit from good gains in business value that we feel confident our portfolio companies will make. But our "catch-up" rewards have been realized, which means we'll have to settle for a single-dip in the future.

We face another obstacle: In a finite world, high growth rates must self-destruct. If the base from which the growth is taking place is tiny, this law may not operate for a time. But when the base balloons, the party ends: A high growth rate eventually forges its own anchor.

Carl Sagan has entertainingly described this phenomenon, musing about the destiny of bacteria that reproduce by dividing into two every 15 minutes. Says Sagan: "That means four doublings an hour, and 96 doublings a day. Although a bacterium weighs only about a trillionth of a gram, its descendants, after a day of wild asexual abandon, will collectively weigh as much as a mountain [...] in two days, more than the sun-and before very long, everything in the universe will be made of bacteria." Not to worry, says Sagan: Some obstacle always impedes this kind of exponential growth. "The bugs run out of food, or they poison each other, or they are shy about reproducing in public."

Even on bad days, Charlie Munger (Berkshire's Vice Chairman and my partner) and I do not think of Berkshire as a bacterium. Nor, to our unending sorrow, have we found a way to double its net worth every 15 minutes. Furthermore, we are not the least bit shy about reproducing-financially-in public. Nevertheless, Sagan's observations apply.

A fat wallet ... is the enemy of superior investment results. And Berkshire now has a net worth of $11.9 billion compared to

---

61 [Divided by hash lines: 1989; 1994; 1996 Owner's Manual.]

about $22 million when Charlie and I began to manage the company. Though there are as many good businesses as ever, it is useless for us to make purchases that are inconsequential in relation to Berkshire's capital. (As Charlie regularly reminds me, "If something is not worth doing at all, it's not worth doing welL") We now consider a security for purchase only if we believe we can deploy at least $100 million in it. Given that minimum, Berkshire's investment universe has shrunk dramatically.

Nevertheless, we will stick with the approach that got us here and try not to relax our standards. Ted Williams, in *The Story of My Life,* explains why: "My argument is, to be a good hitter, you've got to get a good ball to hit. It's the first rule in the book. If I have to bite at stuff that is out of my happy zone, I'm not a .344 hitter. I might only be a .250 hitter." Charlie and I agree and will try to wait for opportunities that are well within our own "happy zone."

We will continue to ignore political and economic forecasts, which are an expensive distraction for many investors and businessmen. Thirty years ago, no one could have foreseen the huge expansion of the Vietnam War, wage and price controls, two oil shocks, the resignation of a president, the dissolution of the Soviet Union, a one-day drop in the Dow of 508 points, or treasury bill yields fluctuating between 2.8% and 17.4%.

But, surprise-none of these blockbuster events made the slightest dent in Ben Graham's investment principles. Nor did they render unsound the negotiated purchases of fine businesses at sensible prices. Imagine the cost to us, then, if we had let a fear of unknowns cause us to defer or alter the deployment of capital. Indeed, we have usually made our best purchases when apprehensions about some macro event were at a peak. Fear is the foe of the faddist, but the friend of the fundamentalist.

A different set of major shocks is sure to occur in the next 30 years. We will neither try to predict these nor to profit from them. If we can identify businesses similar to those we have purchased in the past, external surprises will have little effect on our long-term results.

What we promise you-along with more modest gains-is that during your ownership of Berkshire, you will fare just as Charlie and I do. If you suffer, we will suffer; if we prosper, so will you. And we will not break this bond by introducing compensation arrangements that give us a greater participation in the upside than the downside.

We further promise you that our personal fortunes will remain overwhelmingly concentrated in Berkshire shares: We will not ask you to invest with us and then put our own money elsewhere. In addition, Berkshire dominates both the investment portfolios of most members of our families and of a great many friends who belonged to partnerships that Charlie and I ran in the 1960's. We could not be more motivated to do our best. . . . .

We achieved our gains through the efforts of a superb corps of operating managers who get extraordinary results from some ordinary-appearing businesses. Casey Stengel described managing a baseball team as "getting paid for home runs other fellows hit." That's my formula at Berkshire, also . . . . .

It's far better to own a significant portion of the Hope diamond than 100% of a rhinestone, and the companies just mentioned easily qualify as rare gems. Best of all, we aren't limited to simply a few of this breed, but instead possess a growing collection.

Stock prices will continue to fluctuate-sometimes sharply-and the economy will have its ups and downs. Over time, however, we believe it is highly probable that the sort of businesses we own will continue to increase in value at a satisfactory rate.

I think it's appropriate that I conclude with a discussion of Berkshire's management, today and in the future. As our first owner-related principle tells you, Charlie and I are the managing partners of Berkshire. But we subcontract all of the heavy lifting in this business to the managers of our subsidiaries. In fact, we delegate almost to the point of abdication: Though Berkshire has about 33,000 employees, only 12 of these are at headquarters.

Charlie and I mainly attend to capital allocation and the care and feeding of our key managers. Most of these managers are happiest when they are left alone to run their businesses, and that is customarily just how we leave them. That puts them in charge of all operating decisions and of dispatching the excess cash they generate to headquarters. By sending it to us, they don't get diverted by the various enticements that would come their way were they responsible for deploying the cash their businesses throw off. Furthermore, Charlie and I are exposed to a much wider range of possibilities for investing these funds than any of our managers could find in his or her own industry.

Most of our managers are independently wealthy, and it's therefore up to us to create a climate that encourages them to choose working with Berkshire over golfing or fishing. This leaves

us needing to treat them fairly and in the manner that we would wish to be treated if our positions were reversed.

As for the allocation of capital, that's an activity both Charlie and I enjoy and in which we have acquired some useful experience. In a general sense, grey hair doesn't hurt on this playing field: You don't need good hand-eye coordination or well-toned muscles to push money around (thank heavens). As long as our minds continue to function effectively, Charlie and I can keep on doing our jobs pretty much as we have in the past.

On my death, Berkshire's ownership picture will change but not in a disruptive way: First, only about 1% of my stock will have to be sold to take care of bequests and taxes; second, the balance of my stock will go to my wife, Susan, if she survives me, or to a family foundation if she doesn't. In either event, Berkshire will possess a controlling shareholder guided by the same philosophy and objectives that now set our course.

At that juncture, the Buffett family will not be involved in managing the business, only in picking and overseeing the managers who do. Just who those managers will be, of course, depends on the date of my death. But I can anticipate what the management structure will be: Essentially my job will be split into two parts, with one executive becoming responsible for investments and another for operations. If the acquisition of new businesses is in prospect, the two will cooperate in making the decisions needed. Both executives will report to a board of directors that will be responsive to the controlling shareholder, whose interests will in turn be aligned with yours.

Were we to need the management structure I have just described on an immediate basis, my family and a few key individuals know who I would pick to fill both posts. Both currently work for Berkshire and are people in whom I have total confidence.

I will continue to keep my family posted on the succession issue. Since Berkshire stock will make up virtually my entire estate and will account for a similar portion of the assets of either my wife or the foundation for a considerable period after my death, you can be sure that I have thought through the succession question carefully. You can be equally sure that the principles we have employed to date in running Berkshire will continue to guide the managers who succeed me.

Lest we end on a morbid note, I also want to assure you that I have never felt better. I love running Berkshire, and if enjoying life promotes longevity, Methuselah's record is in jeopardy.62

62 [According to the Bible, Methuselah lived 969 years. *Genesis 5:27.]*

In preparing this compendium and organizing the symposium featuring it, many friends and colleagues generously gave me indispensable help. Iowe an enormous debt of gratitude to Warren Buffett for his generosity of spirit, time, and intellect; for allowing me to undertake the project; and for his direct participation in making it a success. I am equally indebted to Charlie Munger, not only for his service as a panel-master and participant throughout the symposium, but also for allowing me to reprint in this collection portions of his Chairman's letters to the shareholders of Berkshire's Wesco Financial Corporation. Thanks also go to Bob Denham for making the connection, to Susan Buffett and Howard Buffett for joining us throughout the conference weekend, to Ajit Jain, Carol Loomis, Bob Mundheim, and Lou Simpson, and to Debbie Bosanek.

Sam and Ronnie Heyman generously furnished financial support for the symposium through their endowment of the Samuel and Ronnie Heyman Center on Corporate Governance at Cardozo School of Law. All concerned are grateful to the Heymans for that, as well as for their gracious hospitality to many guests during the conference weekend. We at Cardozo are further indebted to the Heymans for making possible many other significant events at our school.

My colleagues at Cardozo also provided unfailing support for this project, especially Arthur Jacobson who must share credit for inspiring the idea of the conference, and Monroe Price who made it all possible. My Cardozo colleague Chuck Yablon also deserves my special thanks, as do my former Cardozo colleagues and predecessors as Directors of the Heyman Center, Bill Bratton and Elliott Weiss. All three participated in the conference as well.

The indefatigable efforts of two editors of the *Cardozo Law Review* during 1996-97 were essential to the planning and coordination of the symposium-Stacy Goldschmidt and Jennifer Newcomb held the fort down at Cardozo while I was visiting at George Washington Law School during the 1996-97 academic year. The *Cardozo Law Review* editors and staff during 1997-98 helped pull the symposium volume together and are due thanks as well, especially Ken Dursht, Yulan Li, Mark Oh, and Steve Sparling. My colleagues at GW Law School were also super-supportive, especially Larry Mitchell, who also participated in the symposium, and Dean Jack Friedenthal.

I also wish to acknowledge David Rudenstine, who served as interim Dean of Cardozo during 1996-97, and Paul Verkuil, who has been the Dean of Cardozo since. Other major assets at Cardozo who contributed to this project include Associate Dean Michael Herz, as well as Cynthia Church, Susan Davis, and Paulette Crowther. My secretaries, Lillian Castanon at Cardozo and Stephanie Boyd at GW, also performed great services.

All the members of my family deserve thanks too, especially my nephew Justin Cunningham, as do many other friends who gave encouragement, including Dana Auslander, Robin Grant, Bill Placke, Michelle Roth, and Deb Skulnik, and old friends and colleagues from Cravath, Swaine & Moore: Joe Adams, Sam Butler, Jeff Hass, Dave Jacquin, Tad O'Connor, Debbie Paul, and Todd Roberts.

My special thanks to all those who joined us at the symposium, especially the wonderful group of panelists whose contributions to the symposium are reflected in part by their provocative papers being published by the *Cardozo Law Review* as part of the symposium. My colleague and co-author at GW Law School, Lew Solomon, chided after the conference that, with the success of this one behind me, I should now retire from organizing conferences. While organizing the conference did entail some effort and a lot of host anxiety, its success was really due to the spontaneous coordination and industry of all the participants. I would be happy to have them all on board for the next one.

Cigar Butt Investing. A foolish method of investing akin to taking the last puff on a cigar, it is the purchase of a stock at a sufficiently low price that there will be some short-term hiccup to produce a profit, even though the business' long-term performance may be terrible. *See* Part ILF.

Dividend Test. Retention of earnings is only justified if each dollar retained produces at least a one dollar increase in per share market value. *See* Part IILC.

Double-Barreled Acquisition Style. A sensible acquisition policy of buying either 100% of businesses in negotiated acquisitions or less than 100% of businesses in stock market purchases. *See* Part LA.

Institutional Imperative. A pervasive force in organizations that leads to irrational business decisions from resistance to change, absorption of corporate funds in suboptimal projects or acquisitions, indulgence of the cravings of senior executives, and mindless imitation of peer companies. *See* Part II.F.

Intrinsic Value. A hard-to-calculate but crucial measure of business value equal to the discounted present value of the cash that can be taken out of a business during its remaining life. *See* Part V.E.

Look-through Earnings. As an alternative to GAAP accounting rules governing investments in marketable securities of the investee less than 20%, this measures the investor's economic performance in part based on the investor's percentage interest of the investee's undistributed earnings (after an incremental reduction for income taxes). *See* Part V.B.

Margin-of-Safety. Probably the single most important principle of sound and successful investing, Ben Graham's principle says not to purchase a security unless the price being paid is substantially lower than the value being delivered. *See* Part ILD.

Mr. Market. Ben Graham's allegory for the overall stock market, a moody manic-depressive where price and value diverge, making superior intelligent investing possible. *See* Part ILA.

Owner Earnings. A better measure of economic performance than cash flow or GAAP earnings affected by purchase accounting adjustments, equal to *(a)* operating earnings *plus (b)* depreciation and other non-cash charges *minus (c)* required reinvestment in a business to maintain present competitive position and unit volume. *See* Part V.D.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1998 was $25.9 billion, which increased the per-share book value of both our Class A and Class B stock by 48.3%. Over the last 34 years (that is, since present management took over) per-share book value has grown from $19 to $37,801, a rate of 24.7% compounded annually.*

Normally, a gain of 48.3% would call for handsprings — but not this year. Remember Wagner, whose music has been described as better than it sounds? Well, Berkshire's progress in 1998 — though more than satisfactory — was not as good as it looks. That's because most of that 48.3% gain came from our issuing shares in acquisitions.

To explain: Our stock sells at a large premium over book value, which means that any issuing of shares we do — whether for cash or as consideration in a merger — instantly increases our per-share book-value figure, even though we've earned not a dime. What happens is that we get more per-share book value in such transactions than we give up. These transactions, however, do not deliver us any immediate gain in per-share *intrinsic value*, because in this respect what we give and what we get are roughly equal. And, as Charlie Munger, Berkshire's Vice Chairman and my partner, and I can't tell you too often (though you may feel that we try), it's the per-share gain in intrinsic value that counts rather than the per-share gain in book value. Though Berkshire's intrinsic value grew very substantially in 1998, the gain fell well short of the 48.3% recorded for book value. Nevertheless, intrinsic value still *far* exceeds book value. (For a more extensive discussion of these terms, and other investment and accounting concepts, please refer to our Owner's Manual, on pages 56-64, in which we set forth our owner-related business principles. Intrinsic value is discussed on pages 61 and 62.)

We entered 1999 with the best collection of businesses and managers in our history. The two companies we acquired in 1998, General Re and Executive Jet, are first-class in every way — more about both later — and the performance of our operating businesses last year exceeded my hopes. GEICO, once again, simply shot the lights out. On the minus side, several of the public companies in which we have major investments experienced significant operating shortfalls that neither they nor I anticipated early in the year. Consequently, our equity portfolio did not perform nearly as well as did the S&P 500. The problems of these companies are almost certainly temporary, and Charlie and I believe that their long-term prospects are excellent.

In our last three annual reports, we furnished you a table that we regard as central to estimating Berkshire's intrinsic value. In the updated version of that table, which follows, we trace our two key components of value, including General Re on a pro-forma basis as if we had owned it throughout the year. The first column lists our per-share ownership of investments (including cash and equivalents but excluding securities held in our financial products operation) and the second column shows our per-share earnings from Berkshire's operating businesses before taxes and purchase-accounting adjustments (discussed on pages 62 and 63), but after all interest and corporate expenses. The second column excludes *all* dividends, interest and capital gains that we realized from the investments presented in the first column. In effect, the columns show how Berkshire would look if it were split into two parts, with one entity holding our investments and the other operating all of our businesses and bearing all corporate costs.

---

*All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Year	Investments Per Share	Pre-tax Earnings Per Share With All Income from Investments Excluded
1968	$ 53	$ 2.87
1978	465	12.85
1988	4,876	145.77
1998	47,647	474.45

Here are the growth rates of the two segments by decade:

Decade Ending	Investments Per Share	Pre-tax Earnings Per Share With All Income from Investments Excluded
1978	24.2%	16.2%
1988	26.5%	27.5%
1998	25.6%	12.5%
Annual Growth Rate, 1968-1998	25.4%	18.6%

During 1998, our investments increased by $9,604 per share, or 25.2%, but per-share operating earnings fell by 33.9%. General Re (included, as noted, on a pro-forma basis) explains both facts. This company has very large investments, and these greatly increased our per-share investment figure. But General Re also had an underwriting loss in 1998, and that hurt operating earnings. Had we not acquired General Re, per-share operating earnings would have shown a modest gain.

Though certain of our acquisitions and operating strategies may from time to time affect one column more than the other, we continually work to increase the figures in both. But one thing is certain: Our future rates of gain will fall far short of those achieved in the past. Berkshire's capital base is now simply too large to allow us to earn truly outsized returns. If you believe otherwise, you should consider a career in sales but avoid one in mathematics (bearing in mind that there are really only three kinds of people in the world: those who can count and those who can't).

Currently we are working to compound a net worth of $57.4 billion, the largest of any American corporation (though our figure will be eclipsed if the merger of Exxon and Mobil takes place). Of course, our lead in net worth does not mean that Berkshire outranks all other businesses in value: Market value is what counts for owners and General Electric and Microsoft, for example, have valuations more than three times Berkshire's. Net worth, though, measures the capital that managers must deploy, and at Berkshire that figure has indeed become huge.

Nonetheless, Charlie and I will do our best to increase intrinsic value in the future at an average rate of 15%, a result we consider to be at the very peak of possible outcomes. We may have years when we exceed 15%, but we will most certainly have other years when we fall far short of that — including years showing negative returns — and those will bring our average down. In the meantime, you should understand just what an average gain of 15% over the next five years implies: It means we will need to increase net worth by $58 billion. Earning this daunting 15% will require us to come up with big ideas: Popcorn stands just won't do. Today's markets are not friendly to our search for "elephants," but you can be sure that we will stay focused on the hunt.

Whatever the future holds, I make you one promise: I'll keep at least 99% of my net worth in Berkshire for as long as I am around. How long will that be? My model is the loyal Democrat in Fort Wayne who asked to be buried in Chicago so that he could stay active in the party. To that end, I've already selected a "power spot" at the office for my urn.

* * * * * * * * * * * *

Our financial growth has been matched by employment growth: We now have 47,566 on our payroll, with the acquisitions of 1998 bringing 7,074 employees to us and internal growth adding another 2,500. To balance this gain

of 9,500 in hands-on employees, we have enlarged the staff at world headquarters from 12 to 12.8. (The .8 doesn't refer to me or Charlie: We have a new person in accounting, working four days a week.) Despite this alarming trend toward corporate bloat, our after-tax overhead last year was about $3.5 million, or well under one basis point (.01 of 1%) of the value of the assets we manage.

Taxes

One beneficiary of our increased size has been the U.S. Treasury. The federal income taxes that Berkshire and General Re have paid, or will soon pay, in respect to 1998 earnings total $2.7 billion. That means we shouldered *all* of the U.S. Government's expenses for more than a half-day.

Follow that thought a little further: If only 625 other U.S. taxpayers had paid the Treasury as much as we and General Re did last year, no one else — neither corporations nor 270 million citizens — would have had to pay federal income taxes or any other kind of federal tax (for example, social security or estate taxes). Our shareholders can truly say that they "gave at the office."

Writing checks to the IRS that include strings of zeros does not bother Charlie or me. Berkshire as a corporation, and we as individuals, have prospered in America as we would have in no other country. Indeed, if we lived in some other part of the world and completely escaped taxes, I'm sure we would be worse off financially (and in many other ways as well). Overall, we feel extraordinarily lucky to have been dealt a hand in life that enables us to write large checks to the government rather than one requiring the government to regularly write checks to us — say, because we are disabled or unemployed.

Berkshire's tax situation is sometimes misunderstood. First, capital gains have no special attraction for us: A corporation pays a 35% rate on taxable income, whether it comes from capital gains or from ordinary operations. This means that Berkshire's tax on a long-term capital gain is fully 75% higher than what an individual would pay on an identical gain.

Some people harbor another misconception, believing that we can exclude 70% of all dividends we receive from our taxable income. Indeed, the 70% rate applies to most corporations and also applies to Berkshire in cases where we hold stocks in non-insurance subsidiaries. However, almost all of our equity investments are owned by our insurance companies, and in that case the exclusion is 59.5%. That still means a dollar of dividends is considerably more valuable to us than a dollar of ordinary income, but not to the degree often assumed.

* * * * * * * * * * * *

Berkshire truly went all out for the Treasury last year. In connection with the General Re merger, we wrote a $30 million check to the government to pay an SEC fee tied to the new shares created by the deal. We understand that this payment set an SEC record. Charlie and I are enormous admirers of what the Commission has accomplished for American investors. We would rather, however, have found another way to show our admiration.

GEICO (1-800-847-7536)

Combine a great idea with a great manager and you're certain to obtain a great result. That mix is alive and well at GEICO. The idea is low-cost auto insurance, made possible by direct-to-customer marketing, and the manager is Tony Nicely. Quite simply, there is no one in the business world who could run GEICO better than Tony does. His instincts are unerring, his energy is boundless, and his execution is flawless. While maintaining underwriting discipline, Tony is building an organization that is gaining market share at an accelerating rate.

This pace has been encouraged by our compensation policies. The direct writing of insurance — that is, without there being an agent or broker between the insurer and its policyholder — involves a substantial front-end investment. First-year business is therefore unprofitable in a major way. At GEICO, we do not wish this cost to deter our associates from the aggressive pursuit of new business — which, as it renews, will deliver significant profits — so we leave it out of our compensation formulas. What's included then? We base 50% of our associates' bonuses and profit sharing on

the earnings of our "seasoned" book, meaning policies that have been with us for more than a year. The other 50% is tied to growth in policyholders — and here we have stepped on the gas.

In 1995, the year prior to its acquisition by Berkshire, GEICO spent $33 million on marketing and had 652 telephone counselors. Last year the company spent $143 million, and the counselor count grew to 2,162. The effects that these efforts had at the company are shown by the new business and in-force figures below:

Years	New Auto Policies*	Auto Policies In-Force*
1993	354,882	2,011,055
1994	396,217	2,147,549
1995	461,608	2,310,037
1996	617,669	2,543,699
1997	913,176	2,949,439
1998	1,317,761	3,562,644

* "Voluntary" only; excludes assigned risks and the like.

In 1999, we will again increase our marketing budget, spending at least $190 million. In fact, there is no limit to what Berkshire is willing to invest in GEICO's new-business activity, as long as we can concurrently build the infrastructure the company needs to properly serve its policyholders.

Because of the first-year costs, companies that are concerned about quarterly or annual earnings would shy from similar investments, no matter how intelligent these might be in terms of building long-term value. Our calculus is different: We simply measure whether we are creating more than a dollar of value per dollar spent — and if that calculation is favorable, the more dollars we spend the happier I am.

There is far more to GEICO's success, of course, than low prices and a torrent of advertising. The handling of claims must also be fair, fast and friendly — and ours is. Here's an impartial scorecard on how we shape up: In New York, our largest-volume state, the Insurance Department recently reported that GEICO's complaint ratio in 1997 was not only the lowest of the five largest auto insurers but was also less than half the average of the other four.

GEICO's 1998 profit margin of 6.7% was better than we had anticipated — and, indeed, better than we wished. Our results reflect an industry-wide phenomenon: In recent years, both the frequency of auto accidents and their severity have unexpectedly declined. We responded by reducing rates 3.3% in 1998, and we will reduce them still more in 1999. These moves will soon bring profit margins down — at the least to 4%, which is our target, and perhaps considerably lower. Whatever the case, we believe that our margins will continue to be much better than those of the industry.

With GEICO's growth and profitability both outstanding in 1998, so also were its profit-sharing and bonus payments. Indeed, the profit-sharing payment of $103 million or 32.3% of salary — which went to all 9,313 associates who had been with us for more than a year — may well have been the highest percentage payment at any large company in the country. (In addition, associates benefit from a company-funded pension plan.)

The 32.3% may turn out to be a high-water mark, given that the profitability component in our profit-sharing calculation is almost certain to come down in the future. The growth component, though, may well increase. Overall, we expect the two benchmarks together to dictate very significant profit-sharing payments for decades to come. For our associates, growth pays off in other ways as well: Last year we promoted 4,612 people.

Impressive as the GEICO figures are, we have far more to do. Our market share improved significantly in 1998 — but only from 3% to 3½%. For every policyholder we now have, there are another ten who should be giving us their business.

Some of you who are reading this may be in that category. About 40% of those who check our rates find that they can save money by doing business with us. The proportion is not 100% because insurers differ in their underwriting judgements, with some giving more credit than we do to drivers who live in certain geographical areas or work at certain occupations. We believe, however, that we more frequently offer the low price than does any other national carrier

selling insurance to all comers. Furthermore, in 40 states we can offer a special discount — usually 8% — to our shareholders. So give us a call and check us out.

* * * * * * * * * * * *

You may think that one commercial in this section is enough. But I have another to present, this one directed at managers of publicly-owned companies.

At Berkshire we feel that telling outstanding CEOs, such as Tony, how to run their companies would be the height of foolishness. Most of our managers wouldn't work for us if they got a lot of backseat driving. (Generally, they don't have to work for *anyone*, since 75% or so are independently wealthy.) Besides, they are the Mark McGwires of the business world and need no advice from us as to how to hold the bat or when to swing.

Nevertheless, Berkshire's ownership may make even the best of managers more effective. First, we eliminate all of the ritualistic and nonproductive activities that normally go with the job of CEO. Our managers are totally in charge of their personal schedules. Second, we give each a simple mission: Just run your business as if: 1) you own 100% of it; 2) it is the only asset in the world that you and your family have or will ever have; and 3) you can't sell or merge it for at least a century. As a corollary, we tell them they should not let any of their decisions be affected even slightly by accounting considerations. We want our managers to think about what counts, not how it will be counted.

Very few CEOs of public companies operate under a similar mandate, mainly because they have owners who focus on short-term prospects and reported earnings. Berkshire, however, has a shareholder base — which it will have for decades to come — that has the longest investment horizon to be found in the public-company universe. Indeed, a majority of our shares are held by investors who expect to die still holding them. We can therefore ask our CEOs to manage for maximum long-term value, rather than for next quarter's earnings. We certainly don't ignore the current results of our businesses — in most cases, they are of great importance — but we *never* want them to be achieved at the expense of our building ever-greater competitive strengths.

I believe the GEICO story demonstrates the benefits of Berkshire's approach. Charlie and I haven't taught Tony a thing — and never will — but we *have* created an environment that allows him to apply all of his talents to what's important. He does not have to devote his time or energy to board meetings, press interviews, presentations by investment bankers or talks with financial analysts. Furthermore, he need never spend a moment thinking about financing, credit ratings or "Street" expectations for earnings per share. Because of our ownership structure, he also knows that this operational framework will endure for decades to come. In this environment of freedom, both Tony and his company can convert their almost limitless potential into matching achievements.

If you are running a large, profitable business that will thrive in a GEICO-like environment, check our acquisition criteria on page 21 and give me a call. I promise a fast answer and will mention your inquiry to no one except Charlie.

Executive Jet Aviation (1-800-848-6436)

To understand the huge potential at Executive Jet Aviation (EJA), you need some understanding of its business, which is selling fractional shares of jets and operating the fleet for its many owners. Rich Santulli, CEO of EJA, created the fractional ownership industry in 1986, by visualizing an important new way of using planes. Then he combined guts and talent to turn his idea into a major business.

In a fractional ownership plan, you purchase a portion — say $^1/_8$th — of any of a wide variety of jets that EJA offers. That purchase entitles you to 100 hours of flying time annually. ("Dead-head" hours don't count against your allotment, and you are also allowed to average your hours over five years.) In addition, you pay both a monthly management fee and a fee for hours actually flown.

Then, on a few hours notice, EJA makes your plane, or another at least as good, available to you at your choice of the 5500 airports in the U.S. In effect, calling up your plane is like phoning for a taxi.

I first heard about the NetJets® program, as it is called, about four years ago from Frank Rooney, our manager at H.H. Brown. Frank had used and been delighted with the service and suggested that I meet Rich to investigate signing up for my family's use. It took Rich about 15 minutes to sell me a quarter (200 hours annually) of a Hawker 1000. Since then, my family has learned firsthand — through flying 900 hours on 300 trips — what a friendly, efficient, and safe operation EJA runs. Quite simply, they love this service. In fact, they quickly grew so enthusiastic that I did a testimonial ad for EJA long before I knew there was any possibility of our purchasing the business. I did, however, ask Rich to give me a call if he ever got interested in selling. Luckily, he phoned me last May, and we quickly made a $725 million deal, paying equal amounts of cash and stock.

EJA, which is by far the largest operator in its industry, has more than 1,000 customers and 163 aircraft (including 23 "core" aircraft that are owned or leased by EJA itself, so that it can make sure that service is first-class even during the times when demand is heaviest). Safety, of course, is the paramount issue in any flight operation, and Rich's pilots — now numbering about 650 — receive extensive training at least twice a year from FlightSafety International, another Berkshire subsidiary and the world leader in pilot training. The bottom line on our pilots: I've sold the Berkshire plane and will now do all of my business flying, as well as my personal flying, with NetJets' crews.

Being the leader in this industry is a major advantage for all concerned. Our customers gain because we have an armada of planes positioned throughout the country at all times, a blanketing that allows us to provide unmatched service. Meanwhile, we gain from the blanketing because it reduces dead-head costs. Another compelling attraction for our clients is that we offer products from Boeing, Gulfstream, Falcon, Cessna, and Raytheon, whereas our two competitors are owned by manufacturers that offer only their own planes. In effect, NetJets is like a physician who can recommend whatever medicine best fits the needs of each patient; our competitors, in contrast, are producers of a "house" brand that they must prescribe for one and all.

In many cases our clients, both corporate and individual, own fractions of several different planes and can therefore match specific planes to specific missions. For example, a client might own $^{1}/_{16}$th of three different jets (each giving it 50 hours of flying time), which in total give it a virtual fleet, obtained for a small fraction of the cost of a single plane.

Significantly, it is not only small businesses that can benefit from fractional ownership. Already, some of America's largest companies use NetJets as a supplement to their own fleet. This saves them big money in both meeting peak requirements and in flying missions that would require their wholly-owned planes to log a disproportionate amount of dead-head hours.

When a plane is slated for personal use, the clinching argument is that either the client signs up now or his children likely will later. That's an equation I explained to my wonderful Aunt Alice 40 years ago when she asked me whether she could afford a fur coat. My reply settled the issue: "Alice, *you* aren't buying it; your heirs are."

EJA's growth has been explosive: In 1997, it accounted for 31% of all corporate jets ordered in the world. Nonetheless, Rich and I believe that the potential of fractional ownership has barely been scratched. If many thousands of owners find it sensible to own 100% of a plane — which must be used 350-400 hours annually if it's to make economic sense — there must be a large multiple of that number for whom fractional ownership works.

In addition to being a terrific executive, Rich is fun. Like most of our managers, he has no economic need whatsoever to work. Rich spends his time at EJA because it's his baby — and he wants to see how far he can take it. We both already know the answer, both literally and figuratively: to the ends of the earth.

* * * * * * * * * * * *

And now a small hint to Berkshire directors: Last year I spent more than nine times my salary at Borsheim's and EJA. Just think how Berkshire's business would boom if you'd only spring for a raise.

General Re

On December 21, we completed our $22 billion acquisition of General Re Corp. In addition to owning 100% of General Reinsurance Corporation, the largest U.S. property-casualty reinsurer, the company also owns (including stock it has an arrangement to buy) 82% of the oldest reinsurance company in the world, Cologne Re. The two companies together reinsure all lines of insurance and operate in 124 countries.

For many decades, General Re's name has stood for quality, integrity and professionalism in reinsurance — and under Ron Ferguson's leadership, this reputation has been burnished still more. Berkshire can add absolutely nothing to the skills of General Re's and Cologne Re's managers. On the contrary, there is a lot that they can teach us.

Nevertheless, we believe that Berkshire's ownership will benefit General Re in important ways and that its earnings a decade from now will materially exceed those that would have been attainable absent the merger. We base this optimism on the fact that we can offer General Re's management a freedom to operate in whatever manner will best allow the company to exploit its strengths.

Let's look for a moment at the reinsurance business to understand why General Re could not on its own do what it can under Berkshire. Most of the demand for reinsurance comes from primary insurers who want to escape the wide swings in earnings that result from large and unusual losses. In effect, a reinsurer gets paid for absorbing the volatility that the client insurer wants to shed.

Ironically, though, a publicly-held reinsurer gets graded by both its owners and those who evaluate its credit on the smoothness of its own results. Wide swings in earnings hurt both credit ratings and p/e ratios, even when the business that produces such swings has an expectancy of satisfactory profits over time. This market reality sometimes causes a reinsurer to make costly moves, among them laying off a significant portion of the business it writes (in transactions that are called "retrocessions") or rejecting good business simply because it threatens to bring on too much volatility.

Berkshire, in contrast, happily accepts volatility, just as long as it carries with it the expectation of increased profits over time. Furthermore, we are a Fort Knox of capital, and that means volatile earnings can't impair our premier credit ratings. Thus we have the perfect structure for writing — and *retaining* — reinsurance in virtually any amount. In fact, we've used this strength over the past decade to build a powerful super-cat business.

What General Re gives us, however, is the distribution force, technical facilities and management that will allow us to employ our structural strength in every facet of the industry. In particular, General Re and Cologne Re can now accelerate their push into international markets, where the preponderance of industry growth will almost certainly occur. As the merger proxy statement spelled out, Berkshire also brings tax and investment benefits to General Re. But the most compelling reason for the merger is simply that General Re's outstanding management can now do what it does best, unfettered by the constraints that have limited its growth.

Berkshire is assuming responsibility for General Re's investment portfolio, though not for Cologne Re's. We will not, however, be involved in General Re's underwriting. We will simply ask the company to exercise the discipline of the past while increasing the proportion of its business that is retained, expanding its product line, and widening its geographical coverage — making these moves in recognition of Berkshire's financial strength and tolerance for wide swings in earnings. As we've long said, we prefer a lumpy 15% return to a smooth 12%.

Over time, Ron and his team will maximize General Re's new potential. He and I have known each other for many years, and each of our companies has initiated significant business that it has reinsured with the other. Indeed, General Re played a key role in the resuscitation of GEICO from its near-death status in 1976.

Both Ron and Rich Santulli plan to be at the annual meeting, and I hope you get a chance to say hello to them.

The Economics of Property-Casualty Insurance

With the acquisition of General Re — and with GEICO's business mushrooming — it becomes more important than ever that you understand how to evaluate an insurance company. The key determinants are: (1) the amount of float that the business generates; (2) its cost; and (3) most important of all, the long-term outlook for both of these factors.

To begin with, float is money we hold but don't own. In an insurance operation, float arises because premiums are received before losses are paid, an interval that sometimes extends over many years. During that time, the insurer invests the money. Typically, this pleasant activity carries with it a downside: The premiums that an insurer takes in usually do not cover the losses and expenses it eventually must pay. That leaves it running an "underwriting loss," which is the cost of float. An insurance business has value if its cost of float over time is less than the cost the company would otherwise incur to obtain funds. But the business is a lemon if its cost of float is higher than market rates for money.

A caution is appropriate here: Because loss costs must be estimated, insurers have enormous latitude in figuring their underwriting results, and that makes it very difficult for investors to calculate a company's true cost of float. Errors of estimation, usually innocent but sometimes not, can be huge. The consequences of these miscalculations flow directly into earnings. An experienced observer can usually detect large-scale errors in reserving, but the general public can typically do no more than accept what's presented, and at times I have been amazed by the numbers that big-name auditors have implicitly blessed. As for Berkshire, Charlie and I attempt to be conservative in presenting its underwriting results to you, because we have found that virtually all surprises in insurance are unpleasant ones.

The table that follows shows the float generated by Berkshire's insurance operations since we entered the business 32 years ago. The data are for every fifth year and also the last, which includes General Re's huge float. For the table we have calculated our float — which we generate in large amounts relative to our premium volume — by adding net loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves, and then subtracting agents balances, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. (Got that?)

Year	Average Float (in $ millions)
1967	17
1972	70
1977	139
1982	221
1987	1,267
1992	2,290
1997	7,093
1998	22,762 (yearend)

Impressive as the growth in our float has been — 25.4% compounded annually — what really counts is the cost of this item. If that becomes too high, growth in float becomes a curse rather than a blessing.

At Berkshire, the news is all good: Our average cost over the 32 years has been well under zero. In aggregate, we have posted a substantial underwriting profit, which means that we have been paid for holding a large and growing amount of money. This is the best of all worlds. Indeed, though our net float is recorded on our balance sheet as a liability, it has had more economic value to us than an equal amount of net worth would have had. As long as we can continue to achieve an underwriting profit, float will continue to outrank net worth in value.

During the next few years, Berkshire's growth in float may well be modest. The reinsurance market is soft, and in this business, relationships change slowly. Therefore, General Re's float — $^{2}/_{3}$rds of our total — is unlikely to increase significantly in the near term. We do expect, however, that our cost of float will remain very attractive compared to that of other insurers.

Sources of Reported Earnings

The table that follows shows the main sources of Berkshire's reported earnings. In this presentation, purchase-accounting adjustments are not assigned to the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. For the reasons discussed on pages 62 and 63, this form of presentation seems to us to be more useful to investors and managers than one utilizing generally-accepted accounting principles (GAAP), which require purchase-premiums to be charged off business-by-business. The total earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

You can be proud of our operating managers. They almost invariably deliver earnings that are at the very top of what conditions in their industries allow, meanwhile fortifying their businesses' long-term competitive strengths. In aggregate, they have created many billions of dollars of value for you.

An example: In my 1994 letter, I reported on Ralph Schey's extraordinary performance at Scott Fetzer. Little did I realize that he was just warming up. Last year Scott Fetzer, operating with no leverage (except for a conservative level of debt in its finance subsidiary), earned a record $96.5 million after-tax on its $112 million net worth.

Today, Berkshire has an unusually large number of individuals, such as Ralph, who are truly legends in their industries. Many of these joined us when we purchased their companies, but in recent years we have also identified a number of strong managers internally. We further expanded our corps of all-stars in an important way when we acquired General Re and EJA.

Charlie and I have the easy jobs at Berkshire: We do very little except allocate capital. And, even then, we are not all that energetic. We have one excuse, though: In allocating capital, activity does not correlate with achievement. Indeed, in the fields of investments and acquisitions, frenetic behavior is often counterproductive. Therefore, Charlie and I mainly just wait for the phone to ring.

Our managers, however, work very hard — and it shows. Naturally, they want to be paid fairly for their efforts, but pay alone can't explain their extraordinary accomplishments. Instead, each is primarily motivated by a vision of just how far his or her business can go — and by a desire to be the one who gets it there. Charlie and I thank them on your behalf and ours.

* * * * * * * * * * * *

Additional information about our various businesses is given on pages 39-53, where you will also find our segment earnings reported on a GAAP basis. In addition, on pages 65-71, we have rearranged Berkshire's financial data into four segments on a non-GAAP basis, a presentation that corresponds to the way Charlie and I think about the company.

Normally, we follow this section with one on "Look-Through" Earnings. Because the General Re acquisition occurred near yearend, though, neither a historical nor a pro-forma calculation of a 1998 number seems relevant. We will resume the look-through calculation in next year's report.

Investments

Below we present our common stock investments. Those with a market value of more than $750 million are itemized.

		12/31/98	
Shares	*Company*	*Cost**	*Market*
		(dollars in millions)	
50,536,900	American Express Company	$1,470	$ 5,180
200,000,000	The Coca-Cola Company	1,299	13,400
51,202,242	The Walt Disney Company	281	1,536
60,298,000	Freddie Mac	308	3,885
96,000,000	The Gillette Company	600	4,590
1,727,765	The Washington Post Company	11	999
63,595,180	Wells Fargo & Company	392	2,540
	Others	2,683	5,135
	Total Common Stocks	$ 7,044	$ 37,265

* Represents tax-basis cost which, in aggregate, is $1.5 billion less than GAAP cost.

During the year, we slightly increased our holdings in American Express, one of our three largest commitments, and left the other two unchanged. However, we trimmed or substantially cut many of our smaller positions. Here, I need to make a confession (ugh): The portfolio actions I took in 1998 actually *decrease*d our gain for the year. In particular, my decision to sell McDonald's was a very big mistake. Overall, you would have been better off last year if I had regularly snuck off to the movies during market hours.

At yearend, we held more than $15 billion in cash equivalents (including high-grade securities due in less than one year). Cash never makes us happy. But it's better to have the money burning a hole in Berkshire's pocket than resting comfortably in someone else's. Charlie and I will continue our search for large equity investments or, better yet, a really major business acquisition that would absorb our liquid assets. Currently, however, we see nothing on the horizon.

Once we knew that the General Re merger would definitely take place, we asked the company to dispose of the equities that it held. (As mentioned earlier, we do not manage the Cologne Re portfolio, which includes many equities.) General Re subsequently eliminated its positions in about 250 common stocks, incurring $935 million of taxes in the process. This "clean sweep" approach reflects a basic principle that Charlie and I employ in business and investing: We don't back into decisions.

Last year I deviated from my standard practice of not disclosing our investments (other than those we are legally required to report) and told you about three unconventional investments we had made. There were several reasons behind that disclosure. First, questions about our silver position that we had received from regulatory authorities led us to believe that they wished us to publicly acknowledge this investment. Second, our holdings of zero-coupon bonds were so large that we wanted our owners to know of this investment's potential impact on Berkshire's net worth. Third, we simply wanted to alert you to the fact that we sometimes *do* make unconventional commitments.

Normally, however, as discussed in the Owner's Manual on page 61, we see no advantage in talking about specific investment actions. Therefore — unless we again take a position that is particularly large — we will not post you as to what we are doing in respect to any specific holding of an unconventional sort. We can report, however, that we have eliminated certain of the positions discussed last year and added certain others.

Our never-comment-even-if-untrue policy in regard to investments may disappoint "piggybackers" but will benefit owners: Your Berkshire shares would be worth less if we discussed what we are doing. Incidentally, we should warn you that media speculation about our investment moves continues in most cases to be incorrect. People who rely on such commentary do so at their own peril.

Accounting — Part 1

Our General Re acquisition put a spotlight on an egregious flaw in accounting procedure. Sharp-eyed shareholders reading our proxy statement probably noticed an unusual item on page 60. In the pro-forma statement of income — which detailed how the combined 1997 earnings of the two entities would have been affected by the merger — there was an item stating that compensation expense would have been increased by $63 million.

This item, we hasten to add, does not signal that either Charlie or I have experienced a major personality change. (He still travels coach and quotes Ben Franklin.) Nor does it indicate any shortcoming in General Re's accounting practices, which have followed GAAP to the letter. Instead, the pro-forma adjustment came about because we are replacing General Re's longstanding stock option plan with a cash plan that ties the incentive compensation of General Re managers to their operating achievements. Formerly what counted for these managers was General Re's stock price; now their payoff will come from the business performance they deliver.

The new plan and the terminated option arrangement have matching economics, which means that the rewards they deliver to employees should, for a given level of performance, be the same. But what these people could have formerly anticipated earning from new option grants will now be paid in cash. (Options granted in past years remain outstanding.)

Though the two plans are an economic wash, the cash plan we are putting in will produce a vastly different accounting result. This Alice-in-Wonderland outcome occurs because existing accounting principles ignore the cost of stock options when earnings are being calculated, even though options are a huge and increasing expense at a great many corporations. In effect, accounting principles offer management a choice: Pay employees in one form and count the cost, or pay them in another form and ignore the cost. Small wonder then that the use of options

has mushroomed. This lop-sided choice has a big downside for owners, however: Though options, if properly structured, can be an appropriate, *and even ideal*, way to compensate and motivate top managers, they are more often wildly capricious in their distribution of rewards, inefficient as motivators, and inordinately expensive for shareholders.

Whatever the merits of options may be, their accounting treatment is outrageous. Think for a moment of that $190 million we are going to spend for advertising at GEICO this year. Suppose that instead of paying cash for our ads, we paid the media in ten-year, at-the-market Berkshire options. Would anyone then care to argue that Berkshire had not borne a cost for advertising, or should not be charged this cost on its books?

Perhaps Bishop Berkeley — you may remember him as the philosopher who mused about trees falling in a forest when no one was around — would believe that an expense unseen by an accountant does not exist. Charlie and I, however, have trouble being philosophical about unrecorded costs. When we consider investing in an option-issuing company, we make an appropriate downward adjustment to reported earnings, simply subtracting an amount equal to what the company could have realized by publicly selling options of like quantity and structure. Similarly, if we contemplate an acquisition, we include in our evaluation the cost of replacing any option plan. Then, if we make a deal, we promptly take that cost out of hiding.

Readers who disagree with me about options will by this time be mentally quarreling with my equating the cost of options issued to employees with those that might theoretically be sold and traded publicly. It is true, to state one of these arguments, that employee options are sometimes forfeited — that lessens the damage done to shareholders — whereas publicly-offered options would not be. It is true, also, that companies receive a tax deduction when employee options are exercised; publicly-traded options deliver no such benefit. But there's an offset to these points: Options issued to employees are often repriced, a transformation that makes them much more costly than the public variety.

It's sometimes argued that a non-transferable option given to an employee is less valuable to him than would be a publicly-traded option that he could freely sell. That fact, however, does not reduce the *cost* of the non-transferable option: Giving an employee a company car that can only be used for certain purposes diminishes its value to the employee, but does not in the least diminish its cost to the employer.

The earning revisions that Charlie and I have made for options in recent years have frequently cut the reported per-share figures by 5%, with 10% not all that uncommon. On occasion, the downward adjustment has been so great that it has affected our portfolio decisions, causing us either to make a sale or to pass on a stock purchase we might otherwise have made.

A few years ago we asked three questions in these pages to which we have not yet received an answer: "If options aren't a form of compensation, what are they? If compensation isn't an expense, what is it? And, if expenses shouldn't go into the calculation of earnings, where in the world should they go?"

Accounting — Part 2

The role that managements have played in stock-option accounting has hardly been benign: A distressing number of both CEOs and auditors have in recent years bitterly fought FASB's attempts to replace option fiction with truth and virtually none have spoken out in support of FASB. Its opponents even enlisted Congress in the fight, pushing the case that inflated figures were in the national interest.

Still, I believe that the behavior of managements has been even worse when it comes to restructurings and merger accounting. Here, many managements purposefully work at manipulating numbers and deceiving investors. And, as Michael Kinsley has said about Washington: "The scandal isn't in what's done that's *illegal* but rather in what's *legal*."

It was once relatively easy to tell the good guys in accounting from the bad: The late 1960's, for example, brought on an orgy of what one charlatan dubbed "bold, imaginative accounting" (the practice of which, incidentally, made him loved for a time by Wall Street because he never missed expectations). But most investors

of that period knew who was playing games. And, to their credit, virtually all of America's most-admired companies then shunned deception.

In recent years, probity has eroded. Many major corporations still play things straight, but a significant and growing number of otherwise high-grade managers — CEOs you would be happy to have as spouses for your children or as trustees under your will — have come to the view that it's okay to manipulate earnings to satisfy what they believe are Wall Street's desires. Indeed, many CEOs think this kind of manipulation is not only okay, but actually their *duty*.

These managers start with the assumption, all too common, that their job at all times is to encourage the highest stock price possible (a premise with which we adamantly disagree). To pump the price, they strive, admirably, for operational excellence. But when operations don't produce the result hoped for, these CEOs resort to unadmirable accounting stratagems. These either manufacture the desired "earnings" or set the stage for them in the future.

Rationalizing this behavior, these managers often say that their shareholders will be hurt if their currency for doing deals — that is, their stock — is not fully-priced, and they also argue that in using accounting shenanigans to get the figures they want, they are only doing what everybody else does. Once such an everybody's-doing-it attitude takes hold, ethical misgivings vanish. Call this behavior Son of Gresham: Bad accounting drives out good.

The distortion *du jour* is the "restructuring charge," an accounting entry that can, of course, be legitimate but that too often is a device for manipulating earnings. In this bit of legerdemain, a large chunk of costs that should properly be attributed to a number of years is dumped into a single quarter, typically one already fated to disappoint investors. In some cases, the purpose of the charge is to clean up earnings misrepresentations of the past, and in others it is to prepare the ground for future misrepresentations. In either case, the size and timing of these charges is dictated by the cynical proposition that Wall Street will not mind if earnings fall short by $5 per share in a given quarter, just as long as this deficiency ensures that quarterly earnings in the future will consistently exceed expectations by five cents per share.

This dump-everything-into-one-quarter behavior suggests a corresponding "bold, imaginative" approach to — golf scores. In his first round of the season, a golfer should ignore his actual performance and simply fill his card with atrocious numbers — double, triple, quadruple bogeys — and then turn in a score of, say, 140. Having established this "reserve," he should go to the golf shop and tell his pro that he wishes to "restructure" his imperfect swing. Next, as he takes his new swing onto the course, he should count his good holes, but not the bad ones. These remnants from his old swing should be charged instead to the reserve established earlier. At the end of five rounds, then, his record will be 140, 80, 80, 80, 80 rather than 91, 94, 89, 94, 92. On Wall Street, they will ignore the 140 — which, after all, came from a "discontinued" swing — and will classify our hero as an 80 shooter (and one who *never* disappoints).

For those who prefer to cheat up front, there would be a variant of this strategy. The golfer, playing alone with a cooperative caddy-auditor, should defer the recording of bad holes, take four 80s, accept the plaudits he gets for such athleticism and consistency, and then turn in a fifth card carrying a 140 score. After rectifying his earlier scorekeeping sins with this "big bath," he may mumble a few apologies but will refrain from returning the sums he has previously collected from comparing scorecards in the clubhouse. (The caddy, need we add, will have acquired a loyal patron.)

Unfortunately, CEOs who use variations of these scoring schemes in real life tend to become addicted to the games they're playing — after all, it's easier to fiddle with the scorecard than to spend hours on the practice tee — and never muster the will to give them up. Their behavior brings to mind Voltaire's comment on sexual experimentation: "Once a philosopher, twice a pervert."

In the acquisition arena, restructuring has been raised to an art form: Managements now frequently use mergers to dishonestly rearrange the value of assets and liabilities in ways that will allow them to both smooth and swell future earnings. Indeed, at deal time, major auditing firms sometimes point out the possibilities for a little accounting magic (or for a lot). Getting this push from the pulpit, first-class people will frequently stoop

to third-class tactics. CEOs understandably do not find it easy to reject auditor-blessed strategies that lead to increased future "earnings."

An example from the property-casualty insurance industry will illuminate the possibilities. When a p-c company is acquired, the buyer sometimes simultaneously increases its loss reserves, often substantially. This boost may merely reflect the previous inadequacy of reserves — though it is uncanny how often an actuarial "revelation" of this kind coincides with the inking of a deal. In any case, the move sets up the possibility of 'earnings" flowing into income at some later date, as reserves are released.

Berkshire has kept entirely clear of these practices: If we are to disappoint you, we would rather it be with our earnings than with our accounting. In all of our acquisitions, we have left the loss reserve figures exactly as we found them. After all, we have consistently joined with insurance managers knowledgeable about their business and honest in their financial reporting. When deals occur in which liabilities are increased immediately and substantially, simple logic says that at least one of those virtues must have been lacking — or, alternatively, that the acquirer is laying the groundwork for future infusions of "earnings."

Here's a true story that illustrates an all-too-common view in corporate America. The CEOs of two large banks, one of them a man who'd made many acquisitions, were involved not long ago in a friendly merger discussion (which in the end didn't produce a deal). The veteran acquirer was expounding on the merits of the possible combination, only to be skeptically interrupted by the other CEO: "But won't that mean a huge charge," he asked, "perhaps as much as $1 billion?" The "sophisticate" wasted no words: "We'll make it bigger than that — that's why we're doing the deal."

A preliminary tally by R. G. Associates, of Baltimore, of special charges taken or announced during 1998 — that is, charges for restructuring, in-process R&D, merger-related items, and write-downs — identified no less than 1,369 of these, totaling $72.1 billion. That is a staggering amount as evidenced by this bit of perspective: The 1997 earnings of the 500 companies in Fortune's famous list totaled $324 billion.

Clearly the attitude of disrespect that many executives have today for accurate reporting is a business disgrace. And auditors, as we have already suggested, have done little on the positive side. Though auditors *should* regard the investing public as their client, they tend to kowtow instead to the managers who choose them and dole out their pay. ("Whose bread I eat, his song I sing.")

A big piece of news, however, is that the SEC, led by its chairman, Arthur Levitt, seems determined to get corporate America to clean up its act. In a landmark speech last September, Levitt called for an end to "earnings management." He correctly observed, "Too many corporate managers, auditors and analysts are participants in a game of nods and winks." And then he laid on a real indictment: "Managing may be giving way to manipulating; integrity may be losing out to illusion."

I urge you to read the Chairman's speech (you can find it on the Internet at www.sec.gov) and to support him in his efforts to get corporate America to deliver a straight story to its owners. Levitt's job will be Herculean, but it is hard to think of another more important for him to take on.

Reports to Shareholders

Berkshire's Internet site, www.berkshirehathaway.com, has become a prime source for information about the company. While we continue to send an annual report to all shareholders, we now send quarterlies only to those who request them, letting others read these at our site. In this report, we again enclose a card that can be returned by those wanting to get printed quarterlies in 1999.

Charlie and I have two simple goals in reporting: 1) We want to give you the information that we would wish you to give us if our positions were reversed; and 2) We want to make Berkshire's information accessible to all of you simultaneously. Our ability to reach that second goal is greatly helped by the Internet.

In another portion of his September speech, Arthur Levitt deplored what he called "selective disclosure." His remarks were timely: Today, many companies matter-of-factly favor Wall Street analysts and institutional

investors in a variety of ways that often skirt or cross the line of unfairness. These practices leave the great bulk of shareholders at a distinct disadvantage to a favored class.

At Berkshire, we regard the holder of one share of B stock as the equal of our large institutional investors. We, of course, warmly welcome institutions as owners and have gained a number of them through the General Re merger. We hope also that these new holders find that our owner's manual and annual reports offer them more insights and information about Berkshire than they garner about other companies from the investor relations departments that these corporations typically maintain. But if it is "earnings guidance" or the like that shareholders or analysts seek, we will simply guide them to our public documents.

This year we plan to post our quarterly reports on the Internet after the close of the market on May 14, August 13, and November 12. We also expect to put the 1999 annual report on our website on Saturday, March 11, 2000, and to mail the print version at roughly the same time.

We promptly post press releases on our website. This means that you do not need to rely on the versions of these reported by the media but can instead read the full text on your computer.

Despite the pathetic technical skills of your Chairman, I'm delighted to report that GEICO, Borsheim's, See's, and The Buffalo News are now doing substantial business via the Internet. We've also recently begun to offer annuity products on our website. This business was developed by Ajit Jain, who over the last decade has personally accounted for a significant portion of Berkshire's operating earnings. While Charlie and I sleep, Ajit keeps thinking of new ways to add value to Berkshire.

Shareholder-Designated Contributions

About 97.5% of all eligible shares participated in Berkshire's 1998 shareholder-designated contributions program, with contributions totaling $16.9 million. A full description of the program appears on pages 54-55.

Cumulatively, over the 18 years of the program, Berkshire has made contributions of $130 million pursuant to the instructions of our shareholders. The rest of Berkshire's giving is done by our subsidiaries, which stick to the philanthropic patterns that prevailed before they were acquired (except that their former owners themselves take on the responsibility for their personal charities). In aggregate, our subsidiaries made contributions of $12.5 million in 1998, including in-kind donations of $2.0 million.

To participate in future programs, you must own Class A shares that are registered in the name of the actual owner, not the nominee name of a broker, bank or depository. Shares not so registered on August 31, 1999, will be ineligible for the 1999 program. When you get the contributions form from us, return it promptly so that it does not get put aside or forgotten. Designations received after the due date will not be honored.

The Annual Meeting

This year's Woodstock for Capitalists will be held May 1-3, and we may face a problem. Last year more than 10,000 people attended our annual meeting, and our shareholders list has since doubled. So we don't quite know what attendance to expect this year. To be safe, we have booked both Aksarben Coliseum, which holds about 14,000 and the Holiday Convention Centre, which can seat an additional 5,000. Because we know that our Omaha shareholders will want to be good hosts to the out-of-towners (many of them come from outside the U.S), we plan to give those visitors first crack at the Aksarben tickets and to subsequently allocate these to greater Omaha residents on a first-come, first-served basis. If we exhaust the Aksarben tickets, we will begin distributing Holiday tickets to Omaha shareholders.

If we end up using both locations, Charlie and I will split our pre-meeting time between the two. Additionally, we will have exhibits and also the Berkshire movie, large television screens and microphones at both sites. When we break for lunch, many attendees will leave Aksarben, which means that those at Holiday can, if they wish, make the five-minute trip to Aksarben and finish out the day there. Buses will be available to transport people who don't have cars.

The doors will open at both locations at 7 a.m. on Monday, and at 8:30 we will premier the 1999 Berkshire movie epic, produced by Marc Hamburg, our CFO. The meeting will last from 9:30 until 3:30, interrupted only by the short lunch break.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the badge you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. In our normal fashion, we will run buses from the larger hotels to the meeting. After the meeting, these will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

The full line of Berkshire products will be available at Aksarben, and the more popular items will also be at Holiday. Last year we set sales records across-the-board, moving 3,700 pounds of See's candy, 1,635 pairs of Dexter shoes, 1,150 sets of Quikut knives and 3,104 Berkshire shirts and hats. Additionally, $26,944 of World Book products were purchased as well as more than 2,000 golf balls with the Berkshire Hathaway logo. Charlie and I are pleased but not satisfied with these numbers and confidently predict new records in all categories this year. Our 1999 apparel line will be unveiled at the meeting, so please defer your designer purchases until you view our collection.

Dairy Queen will also be on hand and will again donate all proceeds to the Children's Miracle Network. Last year we sold about 4,000 Dilly® bars, fudge bars and vanilla/orange bars. Additionally, GEICO will have a booth that will be manned by a number of our top counselors from around the country, all of them ready to supply you with auto insurance quotes. In almost all cases, GEICO will be able to offer you a special shareholder's discount. Check out whether we can save you some money.

The *piece de resistance* of our one-company trade show will be a 79-foot-long, nearly 12-foot-wide, fully-outfitted cabin of a 737 Boeing Business Jet ("BBJ"), which is NetJets' newest product. This plane has a 14-hour range; is designed to carry 19 passengers; and offers a bedroom, an office, and two showers. Deliveries to fractional owners will begin in the first quarter of 2000.

The BBJ will be available for your inspection on May 1-3 near the entrance to the Aksarben hall. You should be able to minimize your wait by making your visit on Saturday or Sunday. Bring along your checkbook in case you decide to make an impulse purchase.

NFM's multi-stored complex, located on a 75-acre site about a mile from Aksarben, is open from 10 a.m. to 9 p.m. on weekdays, and 10 a.m. to 6 p.m. on Saturdays and Sundays. This operation did $300 million in business during 1998 and offers an unrivaled breadth of merchandise — furniture, electronics, appliances, carpets and computers — all at can't-be-beat prices. During the April 30th to May 4th period, shareholders presenting their meeting badge will receive a discount that is customarily given only to its employees.

Borsheim's normally is closed on Sunday but will be open for shareholders from 10 a.m. to 6 p.m. on May 2nd. On annual meeting weekend last year, the store did an incredible amount of business. Sales were double those of the previous year, and the store's volume on Sunday greatly exceeded volume for any day in Borsheim's history. Charlie attributes this record to the fact that he autographed sales tickets that day and, while I have my doubts about this proposition, we are not about to mess with a winning formula. Please give him writer's cramp. On last year's Sunday, Borsheim's wrote 2,501 tickets during the eight hours it was open. For those of you who are mathematically challenged, that is one ticket every 11½ seconds.

Shareholders who wish to avoid Sunday's crowd can visit Borsheim's on Saturday (10 a.m.-5:30 p.m.) or on Monday (10 a.m.-8 p.m.). Be sure to identify yourself as a Berkshire owner so that Susan Jacques, Borsheim's CEO, can quote you a "shareholder-weekend" price. Susan joined us in 1983 as a $4-per-hour salesperson and was made CEO in 1994. This move ranks as one of my best managerial decisions.

Bridge players can look forward to a thrill on Sunday, when Bob Hamman — the best the game has ever seen — will turn up to play with our shareholders in the mall outside of Borsheim's. Bob plays without sorting his cards — hey, maybe that's what's wrong with my game. We will also have a couple of other tables at which another expert or two will be playing.

Gorat's — my favorite steakhouse — will again be open especially for Berkshire shareholders on the Sunday night before the meeting. Though Gorat's served from 4 p.m. until about 1 a.m. last year, its crew was swamped, and some of our shareholders had an uncomfortable wait. This year fewer reservations will be accepted, and we ask that you don't come on Sunday without a reservation. In other years, many of our shareholders have chosen to visit Gorat's on Friday, Saturday or Monday. You can make reservations beginning on April 1 *(but not before)* by calling 402-551-3733. The cognoscenti will continue to order rare T-bones with double orders of hash browns.

The Omaha Golden Spikes (neé the Omaha Royals) will meet the Iowa Cubs on Saturday evening, May 1st, at Rosenblatt Stadium. Your Chairman, whose breaking ball had the crowd buzzing last year, will again take the mound. This year I plan to introduce my "flutterball." It's a real source of irritation to me that many view our annual meeting as a financial event rather than the sports classic I consider it to be. Once the world sees my flutterball, that misperception will be erased.

Our proxy statement includes instructions about obtaining tickets to the game and also a large quantity of other information that should help you to enjoy your visit. I particularly urge the 60,000 shareholders that we gained through the Gen Re merger to join us. Come and meet your fellow capitalists.

* * * * * * * * * * * *

It wouldn't be right to close without a word about the 11.8 people who work with me in Berkshire's corporate office. In addition to handling the myriad of tax, regulatory and administrative matters that come with owning dozens of businesses, this group efficiently and cheerfully manages various special projects, some of which generate hundreds of inquiries. Here's a sample of what went on in 1998:

- 6,106 shareholders designated 3,880 charities to receive contributions.

- Kelly Muchemore processed about 17,500 admission tickets for the annual meeting, along with orders and checks for 3,200 baseball tickets.

- Kelly and Marc Hamburg produced and directed the Aksarben extravaganza, a job that required them to arrange the presentations made by our subsidiaries, prepare our movie, and sometimes lend people a hand with travel and lodging.

- Debbie Bosanek satisfied the varying needs of the 46 media organizations (13 of them non-U.S.) that covered the meeting, and meanwhile, as always, skillfully assisted me in every aspect of my job.

- Debbie and Marc assembled the data for our annual report and oversaw the production and distribution of 165,000 copies. (This year the number will be 325,000.)

- Marc handled 95% of the details — and much of the substance — connected with our completing two major mergers.

- Kelly, Debbie and Deb Ray dealt efficiently with tens of thousands of requests for annual reports and financial information that came through the office.

You and I are paying for only 11.8 people, but we are getting what would at most places be the output of 100. To all of the 11.8, my thanks.

Warren E. Buffett
March 1, 1999 Chairman of the Board

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 1999 was $358 million, which increased the per-share book value of both our Class A and Class B stock by 0.5%. Over the last 35 years (that is, since present management took over) per-share book value has grown from $19 to $37,987, a rate of 24.0% compounded annually.*

The numbers on the facing page show just how poor our 1999 record was. We had the worst absolute performance of my tenure and, compared to the S&P, the worst relative performance as well. Relative results are what concern us: Over time, bad relative numbers will produce unsatisfactory absolute results.

Even Inspector Clouseau could find last year's guilty party: your Chairman. My performance reminds me of the quarterback whose report card showed four Fs and a D but who nonetheless had an understanding coach. "Son," he drawled, "I think you're spending too much time on that one subject."

My "one subject" is capital allocation, and my grade for 1999 most assuredly is a D. What most hurt us during the year was the inferior performance of Berkshire's equity portfolio — and responsibility for that portfolio, leaving aside the small piece of it run by Lou Simpson of GEICO, is entirely mine. Several of our largest investees badly lagged the market in 1999 because they've had disappointing operating results. We still like these businesses and are content to have major investments in them. But their stumbles damaged our performance last year, and it's no sure thing that they will quickly regain their stride.

The fallout from our weak results in 1999 was a more-than-commensurate drop in our stock price. In 1998, to go back a bit, the stock outperformed the business. Last year the business did much better than the stock, a divergence that has continued to the date of this letter. Over time, of course, the performance of the stock *must* roughly match the performance of the business.

Despite our poor showing last year, Charlie Munger, Berkshire's Vice Chairman and my partner, and I expect that the gain in Berkshire's intrinsic value over the next decade will modestly exceed the gain from owning the S&P. We can't guarantee that, of course. But we are willing to back our conviction with our own money. To repeat a fact you've heard before, well over 99% of my net worth resides in Berkshire. Neither my wife nor I have ever sold a share of Berkshire and — unless our checks stop clearing — we have no intention of doing so.

Please note that I spoke of hoping to beat the S&P "modestly." For Berkshire, truly large superiorities over that index are a thing of the past. They existed then because we could buy both businesses and stocks at far more attractive prices than we can now, and also because we then had a much smaller capital base, a situation that allowed us to consider a much wider range of investment opportunities than are available to us today.

Our optimism about Berkshire's performance is also tempered by the expectation — indeed, in our minds, the virtual certainty — that the S&P will do far less well in the next decade or two than it has done since 1982. A recent article in Fortune expressed my views as to why this is inevitable, and I'm enclosing a copy with this report.

Our goal is to run our present businesses well — a task made easy because of the outstanding managers we have in place — and to acquire additional businesses having economic characteristics and managers comparable to those we already own. We made important progress in this respect during 1999 by acquiring Jordan's Furniture and contracting to buy a major portion of MidAmerican Energy. We will talk more about these companies later in the report but let me emphasize one point here: We bought both for cash, issuing no Berkshire shares. Deals of that kind aren't always possible, but that is the method of acquisition that Charlie and I vastly prefer.

---

*All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Guides to Intrinsic Value

I often talk in these pages about intrinsic value, a key, though far from precise, measurement we utilize in our acquisitions of businesses and common stocks. (For an extensive discussion of this, and other investment and accounting terms and concepts, please refer to our Owner's Manual on pages 55 - 62. Intrinsic value is discussed on page 60.)

In our last four reports, we have furnished you a table that we regard as useful in estimating Berkshire's intrinsic value. In the updated version of that table, which follows, we trace two key components of value. The first column lists our per-share ownership of investments (including cash and equivalents but excluding assets held in our financial products operation) and the second column shows our per-share earnings from Berkshire's operating businesses before taxes and purchase-accounting adjustments (discussed on page 61), but after all interest and corporate expenses. The second column excludes *all* dividends, interest and capital gains that we realized from the investments presented in the first column. In effect, the columns show how Berkshire would look if it were split into two parts, with one entity holding our investments and the other operating all of our businesses and bearing all corporate costs.

Year	Investments Per Share	Pre-tax Earnings (Loss) Per Share With All Income from Investments Excluded
1969	$ 45	$ 4.39
1979	577	13.07
1989	7,200	108.86
1999	47,339	(458.55)

Here are the growth rates of the two segments by decade:

Decade Ending	Investments Per Share	Pre-tax Earnings Per Share With All Income from Investments Excluded
1979	29.0%	11.5%
1989	28.7%	23.6%
1999	20.7%	N.A.
Annual Growth Rate, 1969-1999	25.4%	N.A.

In 1999, our per-share investments changed very little, but our operating earnings, affected by negatives that overwhelmed some strong positives, fell apart. Most of our operating managers deserve a grade of A for delivering fine results and for having widened the difference between the intrinsic value of their businesses and the value at which these are carried on our balance sheet. But, offsetting this, we had a huge — and, I believe, aberrational — underwriting loss at General Re. Additionally, GEICO's underwriting profit fell, as we had predicted it would. GEICO's overall performance, though, was terrific, outstripping my ambitious goals.

We do not expect our underwriting earnings to improve in any dramatic way this year. Though GEICO's intrinsic value should grow by a highly satisfying amount, its underwriting performance is almost certain to weaken. That's because auto insurers, as a group, will do worse in 2000, and because we will materially increase our marketing expenditures. At General Re, we are raising rates and, if there is no mega-catastrophe in 2000, the company's underwriting loss should fall considerably. It takes some time, however, for the full effect of rate increases to kick in, and General Re is therefore likely to have another unsatisfactory underwriting year.

You should be aware that one item regularly working to widen the amount by which intrinsic value exceeds book value is the annual charge against income we take for amortization of goodwill — an amount now running about $500 million. This charge reduces the amount of goodwill we show as an asset and likewise the amount that is included in our book value. This is an accounting matter having nothing to do with true economic goodwill, which increases in most years. But even if economic goodwill were to remain constant, the annual amortization charge would persistently widen the gap between intrinsic value and book value.

Though we can't give you a precise figure for Berkshire's intrinsic value, or even an approximation, Charlie and I can assure you that it far exceeds our $57.8 billion book value. Businesses such as See's and Buffalo News are now worth fifteen to twenty times the value at which they are carried on our books. Our goal is to continually widen this spread at all subsidiaries.

A Managerial Story You Will Never Read Elsewhere

Berkshire's collection of managers is unusual in several important ways. As one example, a very high percentage of these men and women are independently wealthy, having made fortunes in the businesses that they run. They work neither because they need the money nor because they are contractually obligated to — we have no contracts at Berkshire. Rather, they work long and hard because they love their businesses. And I use the word "their" advisedly, since these managers are truly in charge — there are no show-and-tell presentations in Omaha, no budgets to be approved by headquarters, no dictums issued about capital expenditures. We simply ask our managers to run their companies as if these are the sole asset of their families and will remain so for the next century.

Charlie and I try to behave with our managers just as we attempt to behave with Berkshire's shareholders, treating both groups as we would wish to be treated if our positions were reversed. Though "working" means nothing to me financially, I love doing it at Berkshire for some simple reasons: It gives me a sense of achievement, a freedom to act as I see fit and an opportunity to interact daily with people I like and trust. Why should our managers — accomplished artists at what they do — see things differently?

In their relations with Berkshire, our managers often appear to be hewing to President Kennedy's charge, "Ask not what your country can do for you; ask what you can do for your country." Here's a remarkable story from last year: It's about R. C. Willey, Utah's dominant home furnishing business, which Berkshire purchased from Bill Child and his family in 1995. Bill and most of his managers are Mormons, and for this reason R. C. Willey's stores have never operated on Sunday. This is a difficult way to do business: Sunday is the favorite shopping day for many customers. Bill, nonetheless, stuck to his principles -- and while doing so built his business from $250,000 of annual sales in 1954, when he took over, to $342 million in 1999.

Bill felt that R. C. Willey could operate successfully in markets outside of Utah and in 1997 suggested that we open a store in Boise. I was highly skeptical about taking a no-Sunday policy into a new territory where we would be up against entrenched rivals open seven days a week. Nevertheless, this was Bill's business to run. So, despite my reservations, I told him to follow both his business judgment and his religious convictions.

Bill then insisted on a truly extraordinary proposition: He would personally buy the land and build the store — for about $9 million as it turned out — and would sell it to us at his cost if it proved to be successful. On the other hand, if sales fell short of his expectations, we could exit the business without paying Bill a cent. This outcome, of course, would leave him with a huge investment in an empty building. I told him that I appreciated his offer but felt that if Berkshire was going to get the upside it should also take the downside. Bill said nothing doing: If there was to be failure because of his religious beliefs, he wanted to take the blow personally.

The store opened last August and immediately became a huge success. Bill thereupon turned the property over to us — including some extra land that had appreciated significantly — and we wrote him a check for his cost. And get this: *Bill refused to take a dime of interest on the capital he had tied up over the two years*.

If a manager has behaved similarly at some other public corporation, I haven't heard about it. You can understand why the opportunity to partner with people like Bill Child causes me to tap dance to work every morning.

* * * * * * * * * * * *

A footnote: After our "soft" opening in August, we had a grand opening of the Boise store about a month later. Naturally, I went there to cut the ribbon (your Chairman, I wish to emphasize, is good for *something*). In my talk I told the crowd how sales had far exceeded expectations, making us, by a considerable margin, the largest home furnishings store in Idaho. Then, as the speech progressed, my memory miraculously began to improve. By the end of my talk, it all had come back to me: Opening a store in Boise had been *my* idea.

The Economics of Property/Casualty Insurance

Our main business — though we have others of great importance — is insurance. To understand Berkshire, therefore, it is necessary that you understand how to evaluate an insurance company. The key determinants are: (1) the amount of float that the business generates; (2) its cost; and (3) most critical of all, the long-term outlook for both of these factors.

To begin with, float is money we hold but don't own. In an insurance operation, float arises because premiums are received before losses are paid, an interval that sometimes extends over many years. During that time, the insurer invests the money. This pleasant activity typically carries with it a downside: The premiums that an insurer takes in usually do not cover the losses and expenses it eventually must pay. That leaves it running an "underwriting loss," which is the cost of float. An insurance business has value if its cost of float over time is less than the cost the company would otherwise incur to obtain funds. But the business is a lemon if its cost of float is higher than market rates for money.

A caution is appropriate here: Because loss costs must be estimated, insurers have enormous latitude in figuring their underwriting results, and that makes it very difficult for investors to calculate a company's true cost of float. Errors of estimation, usually innocent but sometimes not, can be huge. The consequences of these miscalculations flow directly into earnings. An experienced observer can usually detect large-scale errors in reserving, but the general public can typically do no more than accept what's presented, and at times I have been amazed by the numbers that big-name auditors have implicitly blessed. In 1999 a number of insurers announced reserve adjustments that made a mockery of the "earnings" that investors had relied on earlier when making their buy and sell decisions. At Berkshire, we strive to be conservative and consistent in our reserving. Even so, we warn you that an unpleasant surprise is always possible.

The table that follows shows (at intervals) the float generated by the various segments of Berkshire's insurance operations since we entered the business 33 years ago upon acquiring National Indemnity Company (whose traditional lines are included in the segment "Other Primary"). For the table we have calculated our float — which we generate in large amounts relative to our premium volume — by adding net loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves, and then subtracting agents balances, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. (Got that?)

Yearend Float (in $ millions)

Year	GEICO	General Re	Other Reinsurance	Other Primary	Total
1967				20	20
1977			40	131	171
1987			701	807	1,508
1997	2,917		4,014	455	7,386
1998	3,125	14,909	4,305	415	22,754
1999	3,444	15,166	6,285	403	25,298

Growth of float is important — but its cost is what's vital. Over the years we have usually recorded only a small underwriting loss — which means our cost of float was correspondingly low — or actually had an underwriting profit,

which means we were being *paid* for holding other people's money. Indeed, our cumulative result through 1998 was an underwriting profit. In 1999, however, we incurred a $1.4 billion underwriting loss that left us with float cost of 5.8%. One mildly mitigating factor: We enthusiastically welcomed $400 million of the loss because it stems from business that will deliver us exceptional float over the next decade. The balance of the loss, however, was decidedly unwelcome, and our overall result must be judged extremely poor. Absent a mega-catastrophe, we expect float cost to fall in 2000, but any decline will be tempered by our aggressive plans for GEICO, which we will discuss later.

There are a number of people who deserve credit for manufacturing so much "no-cost" float over the years. Foremost is Ajit Jain. It's simply impossible to overstate Ajit's value to Berkshire: He has from scratch built an outstanding reinsurance business, which during his tenure has earned an underwriting profit and now holds $6.3 billion of float.

In Ajit, we have an underwriter equipped with the intelligence to properly rate most risks; the realism to forget about those he can't evaluate; the courage to write huge policies when the premium is appropriate; and the discipline to reject even the smallest risk when the premium is inadequate. It is rare to find a person possessing any one of these talents. For one person to have them all is remarkable.

Since Ajit specializes in super-cat reinsurance, a line in which losses are infrequent but extremely large when they occur, his business is sure to be far more volatile than most insurance operations. To date, we have benefitted from good luck on this volatile book. Even so, Ajit's achievements are truly extraordinary.

In a smaller but nevertheless important way, our "other primary" insurance operation has also added to Berkshire's intrinsic value. This collection of insurers has delivered a $192 million underwriting profit over the past five years while supplying us with the float shown in the table. In the insurance world, results like this are uncommon, and for their feat we thank Rod Eldred, Brad Kinstler, John Kizer, Don Towle and Don Wurster.

As I mentioned earlier, the General Re operation had an exceptionally poor underwriting year in 1999 (though investment income left the company well in the black). Our business was extremely underpriced, both domestically and internationally, a condition that is improving but not yet corrected. Over time, however, the company should develop a growing amount of low-cost float. At both General Re and its Cologne subsidiary, incentive compensation plans are now directly tied to the variables of float growth and cost of float, the same variables that determine value for owners.

Even though a reinsurer may have a tightly focused and rational compensation system, it cannot count on every year coming up roses. Reinsurance is a highly volatile business, and neither General Re nor Ajit's operation is immune to bad pricing behavior in the industry. But General Re has the distribution , the underwriting skills, the culture, and — with Berkshire's backing — the financial clout to become the world's most profitable reinsurance company. Getting there will take time, energy and discipline, but we have no doubt that Ron Ferguson and his crew can make it happen.

GEICO (1-800-847-7536 or GEICO.com)

GEICO made exceptional progress in 1999. The reasons are simple: We have a terrific business idea being implemented by an extraordinary manager, Tony Nicely. When Berkshire purchased GEICO at the beginning of 1996, we handed the keys to Tony and asked him to run the operation exactly as if he owned 100% of it. He has done the rest. Take a look at his scorecard:

Years	New Auto Policies[1][2]	Auto Policies In-Force[1]
1993	346,882	2,011,055
1994	384,217	2,147,549
1995	443,539	2,310,037
1996	592,300	2,543,699
1997	868,430	2,949,439
1998	1,249,875	3,562,644
1999	1,648,095	4,328,900

[1] "Voluntary" only; excludes assigned risks and the like.

[2] Revised to exclude policies moved from one GEICO company to another.

In 1995, GEICO spent $33 million on marketing and had 652 telephone counselors. Last year the company spent $242 million, and the counselor count grew to 2,631. And we are just starting: The pace will step up materially in 2000. Indeed, we would happily commit $1 billion annually to marketing if we knew we could handle the business smoothly and if we expected the last dollar spent to produce new business at an attractive cost.

Currently two trends are affecting acquisition costs. The bad news is that it has become more expensive to develop inquiries. Media rates have risen, and we are also seeing diminishing returns — that is, as both we and our competitors step up advertising, inquiries per ad fall for all of us. These negatives are partly offset, however, by the fact that our closure ratio — the percentage of inquiries converted to sales — has steadily improved. Overall, we believe that our cost of new business, though definitely rising, is well below that of the industry. Of even greater importance, our operating costs for renewal business are the lowest among broad-based national auto insurers. Both of these major competitive advantages are sustainable. Others may copy our model, but they will be unable to replicate our economics.

The table above makes it appear that GEICO's retention of policyholders is falling, but for two reasons appearances are in this case deceiving. First, in the last few years our business mix has moved away from "preferred" policyholders, for whom industrywide retention rates are high, toward "standard" and "non-standard" policyholders for whom retention rates are much lower. (Despite the nomenclature, the three classes have similar profit prospects.) Second, retention rates for relatively new policyholders are always lower than those for long-time customers — and because of our accelerated growth, our policyholder ranks now include an increased proportion of new customers. Adjusted for these two factors, our retention rate has changed hardly at all.

We told you last year that underwriting margins for both GEICO and the industry would fall in 1999, and they did. We make a similar prediction for 2000. A few years ago margins got too wide, having enjoyed the effects of an unusual and unexpected decrease in the frequency and severity of accidents. The industry responded by reducing rates — but now is having to contend with an increase in loss costs. We would not be surprised to see the margins of auto insurers deteriorate by around three percentage points in 2000.

Two negatives besides worsening frequency and severity will hurt the industry this year. First, rate increases go into effect only slowly, both because of regulatory delay and because insurance contracts must run their course before new rates can be put in. Second, reported earnings of many auto insurers have benefitted in the last few years from reserve releases, made possible because the companies overestimated their loss costs in still-earlier years. This reservoir of redundant reserves has now largely dried up, and future boosts to earnings from this source will be minor at best.

In compensating its associates — from Tony on down — GEICO continues to use two variables, and only two, in determining what bonuses and profit-sharing contributions will be: 1) its percentage growth in policyholders and 2) the earnings of its "seasoned" business, meaning policies that have been with us for more than a year. We did outstandingly well on both fronts during 1999 and therefore made a profit-sharing payment of 28.4% of salary (in total, $113.3 million) to the great majority of our associates. Tony and I love writing those checks.

At Berkshire, we want to have compensation policies that are both easy to understand and in sync with what we wish our associates to accomplish. Writing new business is expensive (and, as mentioned, getting more expensive). If we were to include those costs in our calculation of bonuses — as managements did before our arrival at GEICO — we would be penalizing our associates for garnering new policies, even though these are very much in Berkshire's interest. So, in effect, we say to our associates that we will foot the bill for new business. Indeed, because percentage growth in policyholders is part of our compensation scheme, we *reward* our associates for producing this initially-unprofitable business. And then we reward them additionally for holding down costs on our seasoned business.

Despite the extensive advertising we do, our best source of new business is word-of-mouth recommendations from existing policyholders, who on the whole are pleased with our prices and service. An article published last year by *Kiplinger's Personal Finance Magazine* gives a good picture of where we stand in customer satisfaction: The magazine's survey of 20 state insurance departments showed that GEICO's complaint ratio was well below the ratio for most of its major competitors.

Our strong referral business means that we probably could maintain our policy count by spending as little as $50 million annually on advertising. That's a guess, of course, and we will never know whether it is accurate because Tony's foot is going to stay on the advertising pedal (and my foot will be on his). Nevertheless, I want to emphasize that a major percentage of the $300-$350 million we will spend in 2000 on advertising, as well as large additional costs

we will incur for sales counselors, communications and facilities, are optional outlays we choose to make so that we can both achieve significant growth and extend and solidify the promise of the GEICO brand in the minds of Americans.

Personally, I think these expenditures are the best investment Berkshire can make. Through its advertising, GEICO is acquiring a direct relationship with a huge number of households that, on average, will send us $1,100 year after year. That makes us — among all companies, selling whatever kind of product — one of the country's leading direct merchandisers. Also, as we build our long-term relationships with more and more families, cash is pouring in rather than going out (no Internet economics here). Last year, as GEICO increased its customer base by 766,256, it gained $590 million of cash from operating earnings and the increase in float.

In the past three years, we have increased our market share in personal auto insurance from 2.7% to 4.1%. But we rightfully belong in many more households — maybe even yours. Give us a call and find out. About 40% of those people checking our rates find that they can save money by doing business with us. The proportion is not 100% because insurers differ in their underwriting judgments, with some giving more credit than we do to drivers who live in certain geographic areas or work at certain occupations. Our closure rate indicates, however, that we more frequently offer the low price than does any other national carrier selling insurance to all comers. Furthermore, in 40 states we can offer a special discount — usually 8% — to our shareholders. Just be sure to identify yourself as a Berkshire owner so that our sales counselor can make the appropriate adjustment.

* * * * * * * * * * *

It's with sadness that I report to you that Lorimer Davidson, GEICO's former Chairman, died last November, a few days after his 97th birthday. For GEICO, Davy was a business giant who moved the company up to the big leagues. For me, he was a friend, teacher and hero. I have told you of his lifelong kindnesses to me in past reports. Clearly, my life would have developed far differently had he not been a part of it. Tony, Lou Simpson and I visited Davy in August and marveled at his mental alertness — particularly in all matters regarding GEICO. He was the company's number one supporter right up to the end, and we will forever miss him.

Aviation Services

Our two aviation services companies — FlightSafety International ("FSI") and Executive Jet Aviation ("EJA") — are both runaway leaders in their field. EJA, which sells and manages the fractional ownership of jet aircraft, through its NetJets® program, is larger than its next two competitors combined. FSI trains pilots (as well as other transportation professionals) and is five times or so the size of its nearest competitor.

Another common characteristic of the companies is that they are still managed by their founding entrepreneurs. Al Ueltschi started FSI in 1951 with $10,000, and Rich Santulli invented the fractional-ownership industry in 1986. These men are both remarkable managers who have no financial need to work but thrive on helping their companies grow and excel.

Though these two businesses have leadership positions that are similar, they differ in their economic characteristics. FSI must lay out huge amounts of capital. A single flight simulator can cost as much as $15 million — and we have 222. Only one person at a time, furthermore, can be trained in a simulator, which means that the capital investment per dollar of revenue at FSI is exceptionally high. Operating margins must therefore also be high, if we are to earn a reasonable return on capital. Last year we made capital expenditures of $215 million at FSI and FlightSafety Boeing, its 50%-owned affiliate.

At EJA, in contrast, the customer owns the equipment, though we, of course, must invest in a core fleet of our own planes to ensure outstanding service. For example, the Sunday after Thanksgiving, EJA's busiest day of the year, strains our resources since fractions of 169 planes are owned by 1,412 customers, many of whom are bent on flying home between 3 and 6 p.m. On that day, and certain others, we need a supply of company-owned aircraft to make sure all parties get where they want, when they want.

Still, most of the planes we fly are owned by customers, which means that modest pre-tax margins in this business can produce good returns on equity. Currently, our customers own planes worth over $2 billion, and in addition we have $4.2 billion of planes on order. Indeed, the limiting factor in our business right now is the availability of planes. We

now are taking delivery of about 8% of all business jets manufactured in the world, and we wish we could get a bigger share than that. Though EJA was supply-constrained in 1999, its recurring revenues — monthly management fees plus hourly flight fees — increased 46%.

The fractional-ownership industry is still in its infancy. EJA is now building critical mass in Europe, and over time we will expand around the world. Doing that will be expensive — very expensive — but we will spend what it takes. Scale is vital to both us and our customers: The company with the most planes in the air worldwide will be able to offer its customers the best service. "Buy a fraction, get a fleet" has real meaning at EJA.

EJA enjoys another important advantage in that its two largest competitors are both subsidiaries of aircraft manufacturers and sell only the aircraft their parents make. Though these are fine planes, these competitors are severely limited in the cabin styles and mission capabilities they can offer. EJA, in contrast, offers a wide array of planes from five suppliers. Consequently, we can give the customer whatever *he* needs to buy — rather than his getting what the competitor's parent needs to sell.

Last year in this report, I described my family's delight with the one-quarter (200 flight hours annually) of a Hawker 1000 that we had owned since 1995. I got so pumped up by my own prose that shortly thereafter I signed up for one-sixteenth of a Cessna V Ultra as well. Now my annual outlays at EJA and Borsheim's, combined, total ten times my salary. Think of this as a rough guideline for your own expenditures with us.

During the past year, two of Berkshire's outside directors have also signed on with EJA. (Maybe we're paying them too much.) You should be aware that they and I are charged exactly the same price for planes and service as is any other customer: EJA follows a "most favored nations" policy, with no one getting a special deal.

And now, brace yourself. Last year, EJA passed the ultimate test: *Charlie signed up*. No other endorsement could speak more eloquently to the value of the EJA service. Give us a call at 1-800-848-6436 and ask for our "white paper" on fractional ownership.

Acquisitions of 1999

At both GEICO and Executive Jet, our best source of new customers is the happy ones we already have. Indeed, about 65% of our new owners of aircraft come as referrals from current owners who have fallen in love with the service.

Our acquisitions usually develop in the same way. At other companies, executives may devote themselves to pursuing acquisition possibilities with investment bankers, utilizing an auction process that has become standardized. In this exercise the bankers prepare a "book" that makes me think of the Superman comics of my youth. In the Wall Street version, a formerly mild-mannered company emerges from the investment banker's phone booth able to leap over competitors in a single bound and with earnings moving faster than a speeding bullet. Titillated by the book's description of the acquiree's powers, acquisition-hungry CEOs — Lois Lanes all, beneath their cool exteriors — promptly swoon.

What's particularly entertaining in these books is the precision with which earnings are projected for many years ahead. If you ask the author-banker, however, what his own firm will earn *next month*, he will go into a protective crouch and tell you that business and markets are far too uncertain for him to venture a forecast.

Here's one story I can't resist relating: In 1985, a major investment banking house undertook to sell Scott Fetzer, offering it widely — but with no success. Upon reading of this strikeout, I wrote Ralph Schey, then and now Scott Fetzer's CEO, expressing an interest in buying the business. I had never met Ralph, but within a week we had a deal. Unfortunately, Scott Fetzer's letter of engagement with the banking firm provided it a $2.5 million fee upon sale, even if it had nothing to do with finding the buyer. I guess the lead banker felt he should do something for his payment, so he graciously offered us a copy of the book on Scott Fetzer that his firm had prepared. With his customary tact, Charlie responded: "I'll pay $2.5 million *not* to read it."

At Berkshire, our carefully-crafted acquisition strategy is simply to wait for the phone to ring. Happily, it sometimes does so, usually because a manager who sold to us earlier has recommended to a friend that he think about following suit.

Which brings us to the furniture business. Two years ago I recounted how the acquisition of Nebraska Furniture Mart in 1983 and my subsequent association with the Blumkin family led to follow-on transactions with R. C. Willey (1995) and Star Furniture (1997). For me, these relationships have all been terrific. Not only did Berkshire acquire three outstanding retailers; these deals also allowed me to become friends with some of the finest people you will ever meet.

Naturally, I have persistently asked the Blumkins, Bill Child and Melvyn Wolff whether there are any more out there like you. Their invariable answer was the Tatelman brothers of New England and their remarkable furniture business, Jordan's.

I met Barry and Eliot Tatelman last year and we soon signed an agreement for Berkshire to acquire the company. Like our three previous furniture acquisitions, this business had long been in the family — in this case since 1927, when Barry and Eliot's grandfather began operations in a Boston suburb. Under the brothers' management, Jordan's has grown ever more dominant in its region, becoming the largest furniture retailer in New Hampshire as well as Massachusetts.

The Tatelmans don't just sell furniture or manage stores. They also present customers with a dazzling entertainment experience called "shoppertainment." A family visiting a store can have a terrific time, while concurrently viewing an extraordinary selection of merchandise. The business results are also extraordinary: Jordan's has the highest sales per square foot of any major furniture operation in the country. I urge you to visit one of their stores if you are in the Boston area — particularly the one at Natick, which is Jordan's newest. Bring money.

Barry and Eliot are classy people — just like their counterparts at Berkshire's three other furniture operations. When they sold to us, they elected to give each of their employees at least 50¢ for every hour that he or she had worked for Jordan's. This payment added up to $9 million, which came from the Tatelmans' own pockets, not from Berkshire's. And Barry and Eliot were thrilled to write the checks.

Each of our furniture operations is number one in its territory. We now sell more furniture than anyone else in Massachusetts, New Hampshire, Texas, Nebraska, Utah and Idaho. Last year Star's Melvyn Wolff and his sister, Shirley Toomim, scored two major successes: a move into San Antonio and a significant enlargement of Star's store in Austin.

There's no operation in the furniture retailing business remotely like the one assembled by Berkshire. It's fun for me and profitable for you. W. C. Fields once said, "It was a woman who drove me to drink, but unfortunately I never had the chance to thank her." I don't want to make that mistake. My thanks go to Louie, Ron and Irv Blumkin for getting me started in the furniture business and for unerringly guiding me as we have assembled the group we now have.

* * * * * * * * * * * *

Now, for our second acquisition deal: It came to us through my good friend, Walter Scott, Jr., chairman of Level 3 Communications and a director of Berkshire. Walter has many other business connections as well, and one of them is with MidAmerican Energy, a utility company in which he has substantial holdings and on whose board he sits. At a conference in California that we both attended last September, Walter casually asked me whether Berkshire might be interested in making a large investment in MidAmerican, and from the start the idea of being in partnership with Walter struck me as a good one. Upon returning to Omaha, I read some of MidAmerican's public reports and had two short meetings with Walter and David Sokol, MidAmerican's talented and entrepreneurial CEO. I then said that, at an appropriate price, we would indeed like to make a deal.

Acquisitions in the electric utility industry are complicated by a variety of regulations including the Public Utility Holding Company Act of 1935. Therefore, we had to structure a transaction that would avoid Berkshire gaining voting control. Instead we are purchasing an 11% fixed-income security, along with a combination of common stock and exchangeable preferred that will give Berkshire just under 10% of the voting power of MidAmerican but about 76% of the equity interest. All told, our investment will be about $2 billion.

Walter characteristically backed up his convictions with real money: He and his family will buy more MidAmerican stock for cash when the transaction closes, bringing their total investment to about $280 million. Walter will also be the controlling shareholder of the company, and I can't think of a better person to hold that post.

Though there are many regulatory constraints in the utility industry, it's possible that we will make additional commitments in the field. If we do, the amounts involved could be large.

Acquisition Accounting

Once again, I would like to make some comments about accounting, in this case about its application to acquisitions. This is currently a very contentious topic and, before the dust settles, Congress may even intervene (a truly terrible idea).

When a company is acquired, generally accepted accounting principles ("GAAP") currently condone two very different ways of recording the transaction: "purchase" and "pooling." In a pooling, stock must be the currency; in a purchase, payment can be made in either cash or stock. Whatever the currency, managements usually detest purchase accounting because it almost always requires that a "goodwill" account be established and subsequently written off — a process that saddles earnings with a large annual charge that normally persists for decades. In contrast, pooling avoids a goodwill account, which is why managements love it.

Now, the Financial Accounting Standards Board ("FASB") has proposed an end to pooling, and many CEOs are girding for battle. It will be an important fight, so we'll venture some opinions. To begin with, we agree with the many managers who argue that goodwill amortization charges are usually spurious. You'll find my thinking about this in the appendix to our 1983 annual report, which is available on our website, and in the Owner's Manual on pages 55 - 62.

For accounting rules to mandate amortization that will, in the usual case, conflict with reality is deeply troublesome: Most accounting charges *relate* to what's going on, even if they don't precisely measure it. As an example, depreciation charges can't with precision calibrate the decline in value that physical assets suffer, but these charges do at least describe something that is truly occurring: Physical assets invariably deteriorate. Correspondingly, obsolescence charges for inventories, bad debt charges for receivables and accruals for warranties are among the charges that reflect true costs. The annual charges for these expenses can't be exactly measured, but the necessity for estimating them is obvious.

In contrast, economic goodwill does not, in many cases, diminish. Indeed, in a great many instances — perhaps most — it actually grows in value over time. In character, economic goodwill is much like land: The value of both assets is sure to fluctuate, but the direction in which value is going to go is in no way ordained. At See's, for example, economic goodwill has grown, in an irregular but very substantial manner, for 78 years. And, if we run the business right, growth of that kind will probably continue for at least another 78 years.

To escape from the fiction of goodwill charges, managers embrace the fiction of pooling. This accounting convention is grounded in the poetic notion that when two rivers merge their streams become indistinguishable. Under this concept, a company that has been merged into a larger enterprise has not been "purchased" (even though it will often have received a large "sell-out" premium). Consequently, no goodwill is created, and those pesky subsequent charges to earnings are eliminated. Instead, the accounting for the ongoing entity is handled as if the businesses had forever been one unit.

So much for poetry. The reality of merging is usually far different: There is indisputably an acquirer and an acquiree, and the latter has been "purchased," no matter how the deal has been structured. If you think otherwise, just ask employees severed from their jobs which company was the conqueror and which was the conquered. You will find no confusion. So on this point the FASB is correct: In most mergers, a purchase has been made. Yes, there are some true "mergers of equals," but they are few and far between.

Charlie and I believe there's a reality-based approach that should both satisfy the FASB, which correctly wishes to record a purchase, and meet the objections of managements to nonsensical charges for diminution of goodwill. We would first have the acquiring company record its purchase price — whether paid in stock or cash — at fair value. In most cases, this procedure would create a large asset representing economic goodwill. We would then leave this asset on the books, not requiring its amortization. Later, if the economic goodwill became impaired, as it sometimes would, it would be written down just as would any other asset judged to be impaired.

If our proposed rule were to be adopted, it should be applied retroactively so that acquisition accounting would be consistent throughout America — a far cry from what exists today. One prediction: If this plan were to take effect, managements would structure acquisitions more sensibly, deciding whether to use cash or stock based on the real consequences for their shareholders rather than on the unreal consequences for their reported earnings.

* * * * * * * * * * *

In our purchase of Jordan's, we followed a procedure that will maximize the cash produced for our shareholders but minimize the earnings we report to you. Berkshire purchased assets for cash, an approach that on our tax returns permits us to amortize the resulting goodwill over a 15-year period. Obviously, this tax deduction materially increases the amount of cash delivered by the business. In contrast, when stock, rather than assets, is purchased for cash, the resulting writeoffs of goodwill are not tax-deductible. The economic difference between these two approaches is substantial.

From the economic standpoint of the acquiring company, the worst deal of all is a stock-for-stock acquisition. Here, a huge price is often paid without there being any step-up in the tax basis of either the stock of the acquiree or its assets. If the acquired entity is subsequently sold, its owner may owe a large capital gains tax (at a 35% or greater rate), even though the sale may truly be producing a major economic loss.

We have made some deals at Berkshire that used far-from-optimal tax structures. These deals occurred because the sellers insisted on a given structure and because, overall, we still felt the acquisition made sense. We have never done an inefficiently-structured deal, however, in order to make our figures look better.

Sources of Reported Earnings

The table that follows shows the main sources of Berkshire's reported earnings. In this presentation, purchase-accounting adjustments are not assigned to the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. For the reasons discussed on page 61, this form of presentation seems to us to be more useful to investors and managers than one utilizing generally accepted accounting principles (GAAP), which require purchase-premiums to be charged off business-by-business. The total earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

(in millions)

[4] Includes General Re operations for ten days in 1998.

Almost all of our manufacturing, retailing and service businesses had excellent results in 1999. The exception was Dexter Shoe, and there the shortfall did not occur because of managerial problems: In skills, energy and devotion to their work, the Dexter executives are every bit the equal of our other managers. But we manufacture shoes primarily in the U.S., and it has become extremely difficult for domestic producers to compete effectively. In 1999, approximately 93% of the 1.3 billion pairs of shoes purchased in this country came from abroad, where extremely low-cost labor is the rule.

Counting both Dexter and H. H. Brown, we are currently the leading domestic manufacturer of shoes, and we are likely to continue to be. We have loyal, highly-skilled workers in our U.S. plants, and we want to retain every job here that we can. Nevertheless, in order to remain viable, we are sourcing more of our output internationally. In doing that, we have incurred significant severance and relocation costs that are included in the earnings we show in the table.

A few years back, Helzberg's, our 200-store jewelry operation, needed to make operating adjustments to restore margins to appropriate levels. Under Jeff Comment's leadership, the job was done and profits have dramatically rebounded. In the shoe business, where we have Harold Alfond, Peter Lunder, Frank Rooney and Jim Issler in charge, I believe we will see a similar improvement over the next few years.

See's Candies deserves a special comment, given that it achieved a record operating margin of 24% last year. Since we bought See's for $25 million in 1972, it has earned $857 million pre-tax. And, despite its growth, the business has required very little additional capital. Give the credit for this performance to Chuck Huggins. Charlie and I put him in charge the day of our purchase, and his fanatical insistence on both product quality and friendly service has rewarded customers, employees and owners.

Chuck gets better every year. When he took charge of See's at age 46, the company's pre-tax profit, expressed in millions, was about 10% of his age. Today he's 74, and the ratio has increased to 100%. Having discovered this mathematical relationship — let's call it Huggins' Law — Charlie and I now become giddy at the mere thought of Chuck's birthday.

* * * * * * * * * * * *

Additional information about our various businesses is given on pages 39 - 54, where you will also find our segment earnings reported on a GAAP basis. In addition, on pages 63 - 69, we have rearranged Berkshire's financial data into four segments on a non-GAAP basis, a presentation that corresponds to the way Charlie and I think about the company.

Look-Through Earnings

Reported earnings are an inadequate measure of economic progress at Berkshire, in part because the numbers shown in the table presented earlier include only the dividends we receive from investees — though these dividends typically represent only a small fraction of the earnings attributable to our ownership. Not that we mind this division of money, since on balance we regard the undistributed earnings of investees as more valuable to us than the portion paid out. The reason for our thinking is simple: Our investees often have the opportunity to reinvest earnings at high rates of return. So why should we want them paid out?

To depict something closer to economic reality at Berkshire than reported earnings, though, we employ the concept of "look-through" earnings. As we calculate these, they consist of: (1) the operating earnings reported in the previous section, plus; (2) our share of the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us. When tabulating "operating earnings" here, we exclude purchase-accounting adjustments as well as capital gains and other major non-recurring items.

The following table sets forth our 1999 look-through earnings, though I warn you that the figures can be no more than approximate, since they are based on a number of judgment calls. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 13, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's Approximate Ownership at Yearend[1]	Berkshire's Share of Undistributed Operating Earnings (in millions)[2]
American Express Company	11.3%	$228
The Coca-Cola Company	8.1%	144
Freddie Mac	8.6%	127
The Gillette Company	9.0%	53
M&T Bank	6.5%	17
The Washington Post Company	18.3%	30
Wells Fargo & Company	3.6%	108
Berkshire's share of undistributed earnings of major investees		707
Hypothetical tax on these undistributed investee earnings[3]		(99)
Reported operating earnings of Berkshire		1,318
Total look-through earnings of Berkshire		$ 1,926

(1) Does not include shares allocable to minority interests
(2) Calculated on average ownership for the year
(3) The tax rate used is 14%, which is the rate Berkshire pays on the dividends it receives

Investments

Below we present our common stock investments. Those that had a market value of more than $750 million at the end of 1999 are itemized.

Shares	*Company*	*12/31/99* *Cost**	*Market*
		(dollars in millions)	
50,536,900	American Express Company	$1,470	$ 8,402
200,000,000	The Coca-Cola Company	1,299	11,650
59,559,300	Freddie Mac	294	2,803
96,000,000	The Gillette Company	600	3,954
1,727,765	The Washington Post Company	11	960
59,136,680	Wells Fargo & Company	349	2,391
	Others	4,180	6,848
	Total Common Stocks	$8,203	$37,008

* Represents tax-basis cost which, in aggregate, is $691 million less than GAAP cost.

We made few portfolio changes in 1999. As I mentioned earlier, several of the companies in which we have large investments had disappointing business results last year. Nevertheless, we believe these companies have important competitive advantages that will endure over time. This attribute, which makes for good long-term investment results, is one Charlie and I occasionally believe we can identify. More often, however, we can't — not at least with a high degree of conviction. This explains, by the way, why we don't own stocks of tech companies, even though we share the general view that our society will be transformed by their products and services. Our problem — which we can't solve by studying up — is that we have no insights into which participants in the tech field possess a truly *durable* competitive advantage.

Our lack of tech insights, we should add, does not distress us. After all, there are a great many business areas in which Charlie and I have no special capital-allocation expertise. For instance, we bring nothing to the table when it comes to evaluating patents, manufacturing processes or geological prospects. So we simply don't get into judgments in those fields.

If we have a strength, it is in recognizing when we are operating well within our circle of competence and when we are approaching the perimeter. Predicting the long-term economics of companies that operate in fast-changing industries is simply far beyond our perimeter. If others claim predictive skill in those industries — and seem to have their claims validated by the behavior of the stock market — we neither envy nor emulate them. Instead, we just stick with what we understand. If we stray, we will have done so inadvertently, not because we got restless and substituted hope for rationality. Fortunately, it's almost certain there will be opportunities from time to time for Berkshire to do well within the circle we've staked out.

Right now, the prices of the fine businesses we already own are just not that attractive. In other words, we feel much better about the businesses than their stocks. That's why we haven't added to our present holdings. Nevertheless, we haven't yet scaled back our portfolio in a major way: If the choice is between a questionable business at a comfortable price or a comfortable business at a questionable price, we much prefer the latter. What really gets our attention, however, is a comfortable business at a comfortable price.

Our reservations about the prices of securities we own apply also to the general level of equity prices. We have never attempted to forecast what the stock market is going to do in the next month or the next year, and we are not trying to do that now. But, as I point out in the enclosed article, equity investors currently seem wildly optimistic in their expectations about future returns.

We see the growth in corporate profits as being largely tied to the business done in the country (GDP), and we see GDP growing at a real rate of about 3%. In addition, we have hypothesized 2% inflation. Charlie and I have no particular conviction about the accuracy of 2%. However, it's the market's view: Treasury Inflation-Protected Securities (TIPS) yield about two percentage points less than the standard treasury bond, and if you believe inflation rates are going to be higher than that, you can profit by simply buying TIPS and shorting Governments.

If profits do indeed grow along with GDP, at about a 5% rate, the valuation placed on American business is unlikely to climb by much more than that. Add in something for dividends, and you emerge with returns from equities that are dramatically less than most investors have either experienced in the past or expect in the future. If investor expectations become more realistic — and they almost certainly will — the market adjustment is apt to be severe, particularly in sectors in which speculation has been concentrated.

Berkshire will someday have opportunities to deploy major amounts of cash in equity markets — we are confident of that. But, as the song goes, "Who knows where or when?" Meanwhile, if anyone starts explaining to you what is going on in the truly-manic portions of this "enchanted" market, you might remember still another line of song: "Fools give you reasons, wise men never try."

Share Repurchases

Recently, a number of shareholders have suggested to us that Berkshire repurchase its shares. Usually the requests were rationally based, but a few leaned on spurious logic.

There is only one combination of facts that makes it advisable for a company to repurchase its shares: First, the company has available funds — cash plus sensible borrowing capacity — beyond the near-term needs of the business and, second, finds its stock selling in the market below its intrinsic value, conservatively-calculated. To this we add a caveat: Shareholders should have been supplied all the information they need for estimating that value. Otherwise, insiders could take advantage of their uninformed partners and buy out their interests at a fraction of true worth. We have, on rare occasions, seen that happen. Usually, of course, chicanery is employed to drive stock prices up, not down.

The business "needs" that I speak of are of two kinds: First, expenditures that a company must make to maintain its competitive position (e.g., the remodeling of stores at Helzberg's) and, second, optional outlays, aimed at business growth, that management expects will produce more than a dollar of value for each dollar spent (R. C. Willey's expansion into Idaho).

When available funds exceed needs of those kinds, a company with a growth-oriented shareholder population can buy new businesses or repurchase shares. If a company's stock is selling well below intrinsic value, repurchases usually make the most sense. In the mid-1970s, the wisdom of making these was virtually screaming at managements, but few responded. In most cases, those that did made their owners much wealthier than if alternative courses of action had been

pursued. Indeed, during the 1970s (and, spasmodically, for some years thereafter) we searched for companies that were large repurchasers of their shares. This often was a tipoff that the company was both undervalued and run by a shareholder-oriented management.

That day is past. Now, repurchases are all the rage, but are all too often made for an unstated and, in our view, ignoble reason: to pump or support the stock price. The shareholder who chooses to sell today, of course, is benefitted by any buyer, whatever his origin or motives. But the *continuing* shareholder is penalized by repurchases above intrinsic value. Buying dollar bills for $1.10 is not good business for those who stick around.

Charlie and I admit that we feel confident in estimating intrinsic value for only a portion of traded equities and then only when we employ a range of values, rather than some pseudo-precise figure. Nevertheless, it appears to us that many companies now making repurchases are overpaying departing shareholders at the expense of those who stay. In defense of those companies, I would say that it is natural for CEOs to be optimistic about their own businesses. They also know a whole lot more about them than I do. However, I can't help but feel that too often today's repurchases are dictated by management's desire to "show confidence" or be in fashion rather than by a desire to enhance per-share value.

Sometimes, too, companies say they are repurchasing shares to offset the shares issued when stock options granted at much lower prices are exercised. This "buy high, sell low" strategy is one many unfortunate investors have employed — but never intentionally! Managements, however, seem to follow this perverse activity very cheerfully.

Of course, both option grants and repurchases may make sense — but if that's the case, it's not because the two activities are logically related. Rationally, a company's decision to repurchase shares or to issue them should stand on its own feet. Just because stock has been issued to satisfy options — or for any other reason — does not mean that stock should be repurchased at a price above intrinsic value. Correspondingly, a stock that sells well below intrinsic value should be repurchased whether or not stock has previously been issued (or may be because of outstanding options).

You should be aware that, at certain times in the past, I have erred in *not* making repurchases. My appraisal of Berkshire's value was then too conservative or I was too enthused about some alternative use of funds. We have therefore missed some opportunities — though Berkshire's trading volume at these points was too light for us to have done much buying, which means that the gain in our per-share value would have been minimal. (A repurchase of, say, 2% of a company's shares at a 25% discount from per-share intrinsic value produces only a ½% gain in that value at most — and even less if the funds could alternatively have been deployed in value-building moves.)

Some of the letters we've received clearly imply that the writer is unconcerned about intrinsic value considerations but instead wants us to trumpet an intention to repurchase so that the stock will rise (or quit going down). If the writer wants to sell tomorrow, his thinking makes sense — for him! — but if he intends to hold, he should instead hope the stock falls and trades in enough volume for us to buy a lot of it. That's the only way a repurchase program can have any real benefit for a continuing shareholder.

We will not repurchase shares unless we believe Berkshire stock is selling well below intrinsic value, conservatively calculated. Nor will we attempt to talk the stock up or down. (Neither publicly or privately have I ever told anyone to buy or sell Berkshire shares.) Instead we will give all shareholders — and potential shareholders — the same valuation-related information we would wish to have if our positions were reversed.

Recently, when the A shares fell below $45,000, we considered making repurchases. We decided, however, to delay buying, if indeed we elect to do *any*, until shareholders have had the chance to review this report. If we do find that repurchases make sense, we will only rarely place bids on the New York Stock Exchange ("NYSE"). Instead, we will respond to offers made directly to us at or below the NYSE bid. If you wish to offer stock, have your broker call Mark Millard at 402-346-1400. When a trade occurs, the broker can either record it in the "third market" or on the NYSE. We will favor purchase of the B shares if they are selling at more than a 2% discount to the A. We will not engage in transactions involving fewer than 10 shares of A or 50 shares of B.

Please be clear about one point: We will *never* make purchases with the intention of stemming a decline in Berkshire's price. Rather we will make them if and when we believe that they represent an attractive use of the Company's money. At best, repurchases are likely to have only a very minor effect on the future rate of gain in our stock's intrinsic value.

Shareholder-Designated Contributions

About 97.3% of all eligible shares participated in Berkshire's 1999 shareholder-designated contributions program, with contributions totaling $17.2 million. A full description of the program appears on pages 70 - 71.

Cumulatively, over the 19 years of the program, Berkshire has made contributions of $147 million pursuant to the instructions of our shareholders. The rest of Berkshire's giving is done by our subsidiaries, which stick to the philanthropic patterns that prevailed before they were acquired (except that their former owners themselves take on the responsibility for their personal charities). In aggregate, our subsidiaries made contributions of $13.8 million in 1999, including in-kind donations of $2.5 million.

To participate in future programs, you must own Class A shares that are registered in the name of the actual owner, not the nominee name of a broker, bank or depository. Shares not so registered on August 31, 2000, will be ineligible for the 2000 program. When you get the contributions form from us, return it promptly so that it does not get put aside or forgotten. Designations received after the due date will not be honored.

The Annual Meeting

This year's Woodstock Weekend for Capitalists will follow a format slightly different from that of recent years. We need to make a change because the Aksarben Coliseum, which served us well the past three years, is gradually being closed down. Therefore, we are relocating to the Civic Auditorium (which is on Capitol Avenue between 18th and 19th, behind the Doubletree Hotel), the only other facility in Omaha offering the space we require.

The Civic, however, is located in downtown Omaha, and we would create a parking and traffic nightmare if we were to meet there on a weekday. We will, therefore, convene on Saturday, April 29, with the doors opening at 7 a.m., the movie beginning at 8:30 and the meeting itself commencing at 9:30. As in the past, we will run until 3:30 with a short break at noon for food, which will be available at the Civic's concession stands.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. In our normal fashion, we will run buses from the larger hotels to the meeting. After the meeting, the buses will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

We have scheduled the meeting in 2002 and 2003 on the customary first Saturday in May. In 2001, however, the Civic is already booked on that Saturday, so we will meet on April 28. The Civic should fit our needs well on any weekend, since there will then be more than ample parking in nearby lots and garages as well as on streets. We will also be able to greatly enlarge the space we give exhibitors. So, overcoming my normal commercial reticence, I will see that you have a wide display of Berkshire products at the Civic that you can *purchase*. As a benchmark, in 1999 shareholders bought 3,059 pounds of See's candy, $16,155 of World Book Products, 1,928 pairs of Dexter shoes, 895 sets of Quikut knives, 1,752 golf balls with the Berkshire Hathaway logo and 3,446 items of Berkshire apparel. I know you can do better.

Last year, we also initiated the sale of at least eight fractions of Executive Jet aircraft. We will again have an array of models at the Omaha airport for your inspection on Saturday and Sunday. Ask an EJA representative at the Civic about viewing any of these planes.

Dairy Queen will also be on hand at the Civic and again will donate all proceeds to the Children's Miracle Network. Last year we sold 4,586 Dilly® bars, fudge bars and vanilla/orange bars. Additionally, GEICO will have a booth that will be staffed by a number of our top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to offer you a special shareholder's discount. Bring the details of your existing insurance, and check out whether we can save you some money.

Finally, Ajit Jain and his associates will be on hand to offer both no-commission annuities and a liability policy with jumbo limits of a size rarely available elsewhere. Talk to Ajit and learn how to protect yourself and your family against a $10 million judgment.

NFM's newly remodeled complex, located on a 75-acre site on 72nd Street between Dodge and Pacific, is open from 10 a.m. to 9 p.m. on weekdays and 10 a.m. to 6 p.m. on Saturdays and Sundays. This operation offers an unrivaled breadth of merchandise — furniture, electronics, appliances, carpets and computers — all at can't-be-beat prices. In 1999 NFM did more than $300 million of business at its 72nd Street location, which in a metropolitan area of 675,000 is an absolute miracle. During the Thursday, April 27 to Monday, May 1 period, any shareholder presenting his or her meeting credential will receive a discount that is customarily given only to employees. We have offered this break to shareholders the last couple of years, and sales have been amazing. In last year's five-day "Berkshire Weekend," NFM's volume was $7.98 million, an increase of 26% from 1998 and 51% from 1997.

Borsheim's — the largest jewelry store in the country except for Tiffany's Manhattan store — will have two shareholder-only events. The first will be a champagne and dessert party from 6 p.m.-10 p.m. on Friday, April 28. The second, the main gala, will be from 9 a.m. to 6 p.m. on Sunday, April 30. On that day, Charlie and I will be on hand to sign *sales tickets*. Shareholder prices will be available Thursday through Monday, so if you wish to avoid the largest crowds, which will form on Friday evening and Sunday, come at other times and identify yourself as a shareholder. On Saturday, we will be open until 7 p.m. Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, so be prepared to be blown away by both our prices and selection.

In the mall outside of Borsheim's, we will again have Bob Hamman — the best bridge player the game has ever seen — available to play with our shareholders on Sunday. We will also have a few other experts playing at additional tables. In 1999, we had more demand than tables, but we will cure that problem this year.

Patrick Wolff, twice US chess champion, will again be in the mall playing blindfolded against all comers. He tells me that he has never tried to play more than four games simultaneously while handicapped this way but might try to bump that limit to five or six this year. If you're a chess fan, take Patrick on — but be sure to check his blindfold before your first move.

Gorat's — my favorite steakhouse — will again be open exclusively for Berkshire shareholders on Sunday, April 30, and will be serving from 4 p.m. until about midnight. Please remember that you can't come to Gorat's on Sunday without a reservation. To make one, call 402-551-3733 on April 3 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. I make a "quality check" of Gorat's about once a week and can report that their rare T-bone (with a double order of hash browns) is still unequaled throughout the country.

The usual baseball game will be held at Rosenblatt Stadium at 7 p.m. on Saturday night. This year the Omaha Golden Spikes will play the Iowa Cubs. Come early, because that's when the real action takes place. Those who attended last year saw your Chairman pitch to Ernie Banks.

This encounter proved to be the titanic duel that the sports world had long awaited. After the first few pitches — which were not my best, but when have I ever thrown my best? — I fired a brushback at Ernie just to let him know who was in command. Ernie charged the mound, and I charged the plate. But a clash was avoided because we became exhausted before reaching each other.

Ernie was dissatisfied with his performance last year and has been studying the game films all winter. As you may know, Ernie had 512 home runs in his career as a Cub. Now that he has spotted telltale weaknesses in my delivery, he expects to get #513 on April 29. I, however, have learned new ways to disguise my "flutterball." Come and watch this matchup.

I should add that I have extracted a promise from Ernie that he will not hit a "come-backer" at me since I would never be able to duck in time to avoid it. My reflexes are like Woody Allen's, who said his were so slow that he was once hit by a car being pushed by two guys.

Our proxy statement contains instructions about obtaining tickets to the game and also a large quantity of other information that should help you enjoy your visit in Omaha. Join us at the Capitalist Caper on Capitol Avenue.

Warren E. Buffett
March 1, 2000 Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
Average Annual Gain – 1965-2000	23.6%	11.8%	11.8%
Overall Gain – 1964-2000	207,821%	5,383%	202,438%

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2000 was $3.96 billion, which increased the per-share book value of both our Class A and Class B stock by 6.5%. Over the last 36 years (that is, since present management took over) per-share book value has grown from $19 to $40,442, a gain of 23.6% compounded annually.*

Overall, we had a decent year, our book-value gain having outpaced the performance of the S&P 500. And, though this judgment is necessarily subjective, we believe Berkshire's gain in per-share intrinsic value moderately exceeded its gain in book value. (Intrinsic value, as well as other key investment and accounting terms and concepts, are explained in our Owner's Manual on pages 59-66. Intrinsic value is discussed on page 64.)

Furthermore, we completed two significant acquisitions that we negotiated in 1999 and initiated six more. All told, these purchases have cost us about $8 billion, with 97% of that amount paid in cash and 3% in stock. The eight businesses we've acquired have aggregate sales of about $13 billion and employ 58,000 people. Still, we incurred no debt in making these purchases, and our shares outstanding have increased only $^1/_3$ of 1%. Better yet, we remain awash in liquid assets and are both eager and ready for even larger acquisitions.

I will detail our purchases in the next section of the report. But I will tell you now that we have embraced the 21st century by entering such cutting-edge industries as brick, carpet, insulation and paint. Try to control your excitement.

On the minus side, policyholder growth at GEICO slowed to a halt as the year progressed. It has become much more expensive to obtain new business. I told you last year that we would get our money's worth from stepped-up advertising at GEICO in 2000, but I was wrong. We'll examine the reasons later in the report.

Another negative — which has persisted for several years — is that we see our equity portfolio as only mildly attractive. We own stocks of some excellent businesses, but most of our holdings are fully priced and are unlikely to deliver more than moderate returns in the future. We're not alone in facing this problem: The long-term prospect for equities in general is far from exciting.

Finally, there is the negative that recurs annually: Charlie Munger, Berkshire's Vice Chairman and my partner, and I are a year older than when we last reported to you. Mitigating this adverse development is the indisputable fact that the age of your top managers is increasing at a considerably lower rate — *percentage-wise* — than is the case at almost all other major corporations. Better yet, this differential will widen in the future.

Charlie and I continue to aim at increasing Berkshire's per-share value at a rate that, over time, will modestly exceed the gain from owning the S&P 500. As the table on the facing page shows, a small annual advantage in our favor can, if sustained, produce an anything-but-small long-term advantage. To reach our goal we will need to add a few good businesses to Berkshire's stable each year, have the businesses we own generally gain in value, and avoid any material increase in our outstanding shares. We are confident about meeting the last two objectives; the first will require some luck.

It's appropriate here to thank two groups that made my job both easy and fun last year — just as they do every year. First, our operating managers continue to run their businesses in splendid fashion, which allows me to spend my time allocating capital rather than supervising them. (I wouldn't be good at that anyway.)

*All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Our managers are a very special breed. At most large companies, the truly talented divisional managers seldom have the job they really want. Instead they yearn to become CEOs, either at their present employer or elsewhere. Indeed, if they stay put, they and their colleagues are likely to feel they have failed.

At Berkshire, our all-stars have *exactly* the jobs they want, ones that they hope and expect to keep throughout their business lifetimes. They therefore concentrate solely on maximizing the long-term value of the businesses that they "own" and love. If the businesses succeed, they have succeeded. And they stick with us: In our last 36 years, Berkshire has never had a manager of a significant subsidiary voluntarily leave to join another business.

The other group to which I owe enormous thanks is the home-office staff. After the eight acquisitions more than doubled our worldwide workforce to about 112,000, Charlie and I went soft last year and added one more person at headquarters. (Charlie, bless him, never lets me forget Ben Franklin's advice: "A small leak can sink a great ship.") Now we have 13.8 people.

This tiny band works miracles. In 2000 it handled all of the details connected with our eight acquisitions, processed extensive regulatory and tax filings (our tax return covers 4,896 pages), smoothly produced an annual meeting to which 25,000 tickets were issued, and accurately dispensed checks to 3,660 charities designated by our shareholders. In addition, the group dealt with all the routine tasks served up by a company with a revenue run-rate of $40 billion and more than 300,000 owners. And, to add to all of this, the other 12.8 are a delight to be around.

I should pay to have my job.

Acquisitions of 2000

Our acquisition technique at Berkshire is simplicity itself: We answer the phone. I'm also glad to report that it rings a bit more often now, because owners and/or managers increasingly wish to join their companies with Berkshire. Our acquisition criteria are set forth on page 23, and the number to call is 402-346-1400.

Let me tell you a bit about the businesses we have purchased during the past 14 months, starting with the two transactions that were initiated in 1999, but closed in 2000. (This list excludes some smaller purchases that were made by the managers of our subsidiaries and that, in most cases, will be integrated into their operations.)

- I described the first purchase — 76% of **MidAmerican Energy** — in last year's report. Because of regulatory constraints on our voting privileges, we perform only a "one-line" consolidation of MidAmerican's earnings and equity in our financial statements. If we instead fully consolidated the company's figures, our revenues in 2000 would have been $5 billion greater than we reported, though net income would remain the same.

- On November 23, 1999, I received a one-page fax from Bruce Cort that appended a *Washington Post* article describing an aborted buyout of **CORT Business Services**. Despite his name, Bruce has no connection with CORT. Rather, he is an airplane broker who had sold Berkshire a jet in 1986 and who, before the fax, had not been in touch with me for about ten years.

  I knew nothing about CORT, but I immediately printed out its SEC filings and liked what I saw. That same day I told Bruce I had a possible interest and asked him to arrange a meeting with Paul Arnold, CORT's CEO. Paul and I got together on November 29, and I knew at once that we had the right ingredients for a purchase: a fine though unglamorous business, an outstanding manager, and a price (going by that on the failed deal) that made sense.

  Operating out of 117 showrooms, CORT is the national leader in "rent-to-rent" furniture, primarily used in offices but also by temporary occupants of apartments. This business, it should be noted, has no similarity to "rent-to-own" operations, which usually involve the sale of home furnishings and electronics to people having limited income and poor credit.

We quickly purchased CORT for Wesco, our 80%-owned subsidiary, paying about $386 million in cash. You will find more details about CORT's operations in Wesco's 1999 and 2000 annual reports. Both Charlie and I enjoy working with Paul, and CORT looks like a good bet to beat our original expectations.

- Early last year, Ron Ferguson of General Re put me in contact with Bob Berry, whose family had owned **U.S. Liability** for 49 years. This insurer, along with two sister companies, is a medium-sized, highly-respected writer of unusual risks — "excess and surplus lines" in insurance jargon. After Bob and I got in touch, we agreed by phone on a half-stock, half-cash deal.

  In recent years, Tom Nerney has managed the operation for the Berry family and has achieved a rare combination of excellent growth and unusual profitability. Tom is a powerhouse in other ways as well. In addition to having four adopted children (two from Russia), he has an extended family: the Philadelphia Belles, a young-teen girls basketball team that Tom coaches. The team had a 62-4 record last year and finished second in the AAU national tournament.

  Few property-casualty companies are outstanding businesses. We have far more than our share, and U.S. Liability adds luster to the collection.

- **Ben Bridge Jeweler** was another purchase we made by phone, prior to any face-to-face meeting between me and the management. Ed Bridge, who with his cousin, Jon, manages this 65-store West Coast retailer, is a friend of Barnett Helzberg, from whom we bought Helzberg Diamonds in 1995. Upon learning that the Bridge family proposed to sell its company, Barnett gave Berkshire a strong recommendation. Ed then called and explained his business to me, also sending some figures, and we made a deal, again half for cash and half for stock.

  Ed and Jon are fourth generation owner-managers of a business started 89 years ago in Seattle. Both the business and the family— including Herb and Bob, the fathers of Jon and Ed — enjoy extraordinary reputations. Same-store sales have increased by 9%, 11%, 13%, 10%, 12%, 21% and 7% over the past seven years, a truly remarkable record.

  It was vital to the family that the company operate in the future as in the past. No one wanted another jewelry chain to come in and decimate the organization with ideas about synergy and cost saving (which, though they would never work, were certain to be tried). I told Ed and Jon that they would be in charge, and they knew I could be believed: After all, it's obvious that your Chairman would be a disaster at actually running a store or selling jewelry (though there are members of his family who have earned black belts as purchasers).

  In their typically classy way, the Bridges allocated a substantial portion of the proceeds from their sale to the hundreds of co-workers who had helped the company achieve its success. We're proud to be associated with both the family and the company.

- In July we acquired **Justin Industries**, the leading maker of Western boots — including the Justin, Tony Lama, Nocona, and Chippewa brands — and the premier producer of brick in Texas and five neighboring states.

  Here again, our acquisition involved serendipity. On May 4th, I received a fax from Mark Jones, a stranger to me, proposing that Berkshire join a group to acquire an unnamed company. I faxed him back, explaining that with rare exceptions we don't invest with others, but would happily pay him a commission if he sent details and we later made a purchase. He replied that the "mystery company" was Justin. I then went to Fort Worth to meet John Roach, chairman of the company and John Justin, who had built the business and was its major shareholder. Soon after, we bought Justin for $570 million in cash.

  John Justin loved Justin Industries but had been forced to retire because of severe health problems (which sadly led to his death in late February). John was a class act — as a citizen, businessman and human being. Fortunately, he had groomed two outstanding managers, Harrold Melton at Acme and Randy Watson at Justin Boot, each of whom runs his company autonomously.

Acme, the larger of the two operations, produces more than one billion bricks per year at its 22 plants, about 11.7% of the industry's national output. The brick business, however, is necessarily regional, and in its territory Acme enjoys unquestioned leadership. When Texans are asked to name a brand of brick, 75% respond Acme, compared to 16% for the runner-up. (Before our purchase, I couldn't have named a brand of brick. Could you have?) This brand recognition is not only due to Acme's product quality, but also reflects many decades of extraordinary community service by both the company and John Justin.

I can't resist pointing out that Berkshire — whose top management has long been mired in the 19th century — is now one of the very few authentic "clicks-and-bricks" businesses around. We went into 2000 with GEICO doing significant business on the Internet, and then we added Acme. You can bet this move by Berkshire is making them *sweat* in Silicon Valley.

- In June, Bob Shaw, CEO of **Shaw Industries**, the world's largest carpet manufacturer, came to see me with his partner, Julian Saul, and the CEO of a second company with which Shaw was mulling a merger. The potential partner, however, faced huge asbestos liabilities from past activities, and any deal depended on these being eliminated through insurance.

  The executives visiting me wanted Berkshire to provide a policy that would pay *all* future asbestos costs. I explained that though we could write an exceptionally large policy — far larger than any other insurer would ever think of offering — we would never issue a policy that lacked a cap.

  Bob and Julian decided that if we didn't want to bet the ranch on the extent of the acquiree's liability, neither did they. So their deal died. But my interest in Shaw was sparked, and a few months later Charlie and I met with Bob to work out a purchase by Berkshire. A key feature of the deal was that both Bob and Julian were to continue owning at least 5% of Shaw. This leaves us associated with the best in the business as shown by Bob and Julian's record: Each built a large, successful carpet business before joining forces in 1998.

  Shaw has annual sales of about $4 billion, and we own 87.3% of the company. Leaving aside our insurance operation, Shaw is by far our largest business. Now, if people walk all over us, we won't mind.

- In July, Bob Mundheim, a director of **Benjamin Moore Paint**, called to ask if Berkshire might be interested in acquiring it. I knew Bob from Salomon, where he was general counsel during some difficult times, and held him in very high regard. So my answer was "Tell me more."

  In late August, Charlie and I met with Richard Roob and Yvan Dupuy, past and present CEOs of Benjamin Moore. We liked them; we liked the business; and we made a $1 billion cash offer on the spot. In October, their board approved the transaction, and we completed it in December. Benjamin Moore has been making paint for 117 years and has thousands of independent dealers that are a vital asset to its business. Make sure you specify our product for your next paint job.

- Finally, in late December, we agreed to buy **Johns Manville Corp.** for about $1.8 billion. This company's incredible odyssey over the last few decades — too multifaceted to be chronicled here — was shaped by its long history as a manufacturer of asbestos products. The much-publicized health problems that affected many people exposed to asbestos led to JM's declaring bankruptcy in 1982.

  Subsequently, the bankruptcy court established a trust for victims, the major asset of which was a controlling interest in JM. The trust, which sensibly wanted to diversify its assets, agreed last June to sell the business to an LBO buyer. In the end, though, the LBO group was unable to obtain financing.

Consequently, the deal was called off on Friday, December 8th. The following Monday, Charlie and I called Bob Felise, chairman of the trust, and made an all-cash offer with no financing contingencies. The next day the trustees voted tentatively to accept our offer, and a week later we signed a contract.

JM is the nation's leading producer of commercial and industrial insulation and also has major positions in roofing systems and a variety of engineered products. The company's sales exceed $2 billion and the business has earned good, if cyclical, returns. Jerry Henry, JM's CEO, had announced his retirement plans a year ago, but I'm happy to report that Charlie and I have convinced him to stick around.

* * * * * * * * * * * *

Two economic factors probably contributed to the rush of acquisition activity we experienced last year. First, many managers and owners foresaw near-term slowdowns in their businesses — and, in fact, we purchased several companies whose earnings will almost certainly decline this year from peaks they reached in 1999 or 2000. The declines make no difference to us, given that we expect all of our businesses to now and then have ups and downs. (Only in the sales presentations of investment banks do earnings move forever upward.) We don't care about the bumps; what matters are the overall results. But the decisions of other people are sometimes affected by the near-term outlook, which can both spur sellers and temper the enthusiasm of purchasers who might otherwise compete with us.

A second factor that helped us in 2000 was that the market for junk bonds dried up as the year progressed. In the two preceding years, junk bond purchasers had relaxed their standards, buying the obligations of ever-weaker issuers at inappropriate prices. The effects of this laxity were felt last year in a ballooning of defaults. In this environment, "financial" buyers of businesses — those who wish to buy using only a sliver of equity — became unable to borrow all they thought they needed. What they could still borrow, moreover, came at a high price. Consequently, LBO operators became less aggressive in their bidding when businesses came up for sale last year. Because we analyze purchases on an all-equity basis, our evaluations did not change, which means we became considerably more competitive.

Aside from the economic factors that benefited us, we now enjoy a major and growing advantage in making acquisitions in that we are often the buyer of choice for the seller. That fact, of course, doesn't assure a deal — sellers have to like our price, and we have to like their business and management — but it does help.

We find it meaningful when an owner *cares* about whom he sells to. We like to do business with someone who loves his company, not just the money that a sale will bring him (though we certainly understand why he likes that as well). When this emotional attachment exists, it signals that important qualities will likely be found within the business: honest accounting, pride of product, respect for customers, and a loyal group of associates having a strong sense of direction. The reverse is apt to be true, also. When an owner auctions off his business, exhibiting a total lack of interest in what follows, you will frequently find that it has been dressed up for sale, particularly when the seller is a "financial owner." And if owners behave with little regard for their business and its people, their conduct will often contaminate attitudes and practices throughout the company.

When a business masterpiece has been created by a lifetime — or several lifetimes — of unstinting care and exceptional talent, it should be important to the owner what corporation is entrusted to carry on its history. Charlie and I believe Berkshire provides an almost unique home. We take our obligations to the people who created a business very seriously, and Berkshire's ownership structure ensures that we can fulfill our promises. When we tell John Justin that his business will remain headquartered in Fort Worth, or assure the Bridge family that its operation will not be merged with another jeweler, these sellers can take those promises to the bank.

How much better it is for the "painter" of a business Rembrandt to personally select its permanent home than to have a trust officer or uninterested heirs auction it off. Throughout the years we have had great experiences with those who recognize that truth and apply it to their business creations. We'll leave the auctions to others.

The Economics of Property/Casualty Insurance

Our main business — though we have others of great importance — is insurance. To understand Berkshire, therefore, it is necessary that you understand how to evaluate an insurance company. The key determinants are: (1) the amount of float that the business generates; (2) its cost; and (3) most critical of all, the long-term outlook for both of these factors.

To begin with, float is money we hold but don't own. In an insurance operation, float arises because premiums are received before losses are paid, an interval that sometimes extends over many years. During that time, the insurer invests the money. This pleasant activity typically carries with it a downside: The premiums that an insurer takes in usually do not cover the losses and expenses it eventually must pay. That leaves it running an "underwriting loss," which is the cost of float. An insurance business has value if its cost of float over time is less than the cost the company would otherwise incur to obtain funds. But the business is a lemon if its cost of float is higher than market rates for money.

A caution is appropriate here: Because loss costs must be estimated, insurers have enormous latitude in figuring their underwriting results, and that makes it very difficult for investors to calculate a company's true cost of float. Errors of estimation, usually innocent but sometimes not, can be huge. The consequences of these miscalculations flow directly into earnings. An experienced observer can usually detect large-scale errors in reserving, but the general public can typically do no more than accept what's presented, and at times I have been amazed by the numbers that big-name auditors have implicitly blessed. Both the income statements and balance sheets of insurers can be minefields.

At Berkshire, we strive to be both consistent and conservative in our reserving. But we will make mistakes. And we warn you that there is nothing symmetrical about surprises in the insurance business: They almost always are unpleasant.

The table that follows shows (at intervals) the float generated by the various segments of Berkshire's insurance operations since we entered the business 34 years ago upon acquiring National Indemnity Company (whose traditional lines are included in the segment "Other Primary"). For the table we have calculated our float — which we generate in large amounts relative to our premium volume — by adding net loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves, and then subtracting insurance-related receivables, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. (Don't panic, there won't be a quiz.)

Yearend Float (in $ millions)

Year	GEICO	General Re	Other Reinsurance	Other Primary	Total
1967				20	20
1977			40	131	171
1987			701	807	1,508
1997	2,917		4,014	455	7,386
1998	3,125	14,909	4,305	415	22,754
1999	3,444	15,166	6,285	403	25,298
2000	3,943	15,525	7,805	598	27,871

We're pleased by the growth in our float during 2000 but not happy with its cost. Over the years, our cost of float has been very close to zero, with the underwriting profits realized in most years offsetting the occasional terrible year such as 1984, when our cost was a staggering 19%. In 2000, however, we had an underwriting loss of $1.6 billion, which gave us a float cost of 6%. Absent a mega-catastrophe, we expect our float cost to fall in 2001 — perhaps substantially — in large part because of corrections in pricing at General Re that should increasingly be felt as the year progresses. On a smaller scale, GEICO may experience the same improving trend.

There are two factors affecting our cost of float that are very rare at other insurers but that now loom large at Berkshire. First, a few insurers that are currently experiencing large losses have offloaded a significant portion of

these on us in a manner that penalizes our current earnings but gives us float we can use for many years to come. After the loss that we incur in the first year of the policy, there are *no* further costs attached to this business.

When these policies are properly priced, we welcome the pain-today, gain-tomorrow effects they have. In 1999, $400 million of our underwriting loss (about 27.8% of the total) came from business of this kind and in 2000 the figure was $482 million (34.4% of our loss). We have no way of predicting how much similar business we will write in the future, but what we do get will typically be in large chunks. Because these transactions can materially distort our figures, we will tell you about them as they occur.

Other reinsurers have little taste for this insurance. They simply can't stomach what huge underwriting losses do to their reported results, even though these losses are produced by policies whose overall economics are certain to be favorable. You should be careful, therefore, in comparing our underwriting results with those of other insurers.

An even more significant item in our numbers — which, again, you won't find much of elsewhere — arises from transactions in which we assume *past* losses of a company that wants to put its troubles behind it. To illustrate, the XYZ insurance company might have last year bought a policy obligating us to pay the first $1 billion of losses and loss adjustment expenses from events that happened in, say, 1995 and earlier years. These contracts can be very large, though we always require a cap on our exposure. We entered into a number of such transactions in 2000 and expect to close several more in 2001.

Under GAAP accounting, this "retroactive" insurance neither benefits nor penalizes our current earnings. Instead, we set up an asset called "deferred charges applicable to assumed reinsurance," in an amount reflecting the difference between the premium we receive and the (higher) losses we expect to pay (for which reserves are immediately established). We then amortize this asset by making annual charges to earnings that create equivalent underwriting losses. You will find the amount of the loss that we incur from these transactions in both our quarterly and annual management discussion. By their nature, these losses will continue for many years, often stretching into decades. As an offset, though, we have the use of float — lots of it.

Clearly, float carrying an annual cost of this kind is not as desirable as float we generate from policies that are expected to produce an underwriting profit (of which we have plenty). Nevertheless, this retroactive insurance should be decent business for us.

The net of all this is that a) I expect our cost of float to be very attractive in the future but b) rarely to return to a "no-cost" mode because of the annual charge that retroactive reinsurance will lay on us. Also — obviously — the ultimate benefits that we derive from float will depend not only on its cost but, fully as important, how effectively we deploy it.

Our retroactive business is almost single-handedly the work of Ajit Jain, whose praises I sing annually. It is impossible to overstate how valuable Ajit is to Berkshire. Don't worry about my health; worry about his.

Last year, Ajit brought home a $2.4 billion reinsurance premium, perhaps the largest in history, from a policy that retroactively covers a major U.K. company. Subsequently, he wrote a large policy protecting the Texas Rangers from the possibility that Alex Rodriguez will become permanently disabled. As sports fans know, "A-Rod" was signed for $252 million, a record, and we think that our policy probably also set a record for disability insurance. We cover many other sports figures as well.

In another example of his versatility, Ajit last fall negotiated a very interesting deal with Grab.com, an Internet company whose goal was to attract millions of people to its site and there to extract information from them that would be useful to marketers. To lure these people, Grab.com held out the possibility of a $1 billion prize (having a $170 million present value) and we insured its payment. A message on the site explained that the chance of anyone winning the prize was low, and indeed no one won. But the possibility of a win was far from nil.

Writing such a policy, we receive a modest premium, face the possibility of a huge loss, and get good odds. Very few insurers like that equation. And they're unable to cure their unhappiness by reinsurance. Because each policy has unusual — and sometimes unique — characteristics, insurers can't lay off the occasional shock loss

through their standard reinsurance arrangements. Therefore, any insurance CEO doing a piece of business like this must run the small, but real, risk of a horrible quarterly earnings number, one that he would not enjoy explaining to his board or shareholders. Charlie and I, however, like any proposition that makes compelling mathematical sense, regardless of its effect on reported earnings.

At General Re, the news has turned considerably better: Ron Ferguson, along with Joe Brandon, Tad Montross, and a talented supporting cast took many actions during 2000 to bring that company's profitability back to past standards. Though our pricing is not fully corrected, we have significantly repriced business that was severely unprofitable or dropped it altogether. If there's no mega-catastrophe in 2001, General Re's float cost should fall materially.

The last couple of years haven't been any fun for Ron and his crew. But they have stepped up to tough decisions, and Charlie and I applaud them for these. General Re has several important and enduring business advantages. Better yet, it has managers who will make the most of them.

In aggregate, our smaller insurance operations produced an excellent underwriting profit in 2000 while generating significant float — just as they have done for more than a decade. If these companies were a single and separate operation, people would consider it an outstanding insurer. Because the companies instead reside in an enterprise as large as Berkshire, the world may not appreciate their accomplishments — but I sure do. Last year I thanked Rod Eldred, John Kizer, Don Towle and Don Wurster, and I again do so. In addition, we now also owe thanks to Tom Nerney at U.S. Liability and Michael Stearns, the new head of Cypress.

You may notice that Brad Kinstler, who *was* CEO of Cypress and whose praises I've sung in the past, is no longer in the list above. That's because we needed a new manager at Fechheimer Bros., our Cincinnati-based uniform company, and called on Brad. We seldom move Berkshire managers from one enterprise to another, but maybe we should try it more often: Brad is hitting home runs in his new job, just as he always did at Cypress.

GEICO (1-800-847-7536 or GEICO.com)

We show below the usual table detailing GEICO's growth. Last year I enthusiastically told you that we would step up our expenditures on advertising in 2000 and that the added dollars were the best investment that GEICO could make. I was wrong: The extra money we spent did not produce a commensurate increase in inquiries. Additionally, the percentage of inquiries that we converted into sales fell for the first time in many years. These negative developments combined to produce a sharp increase in our per-policy acquisition cost.

Years	New Auto Policies[(1)]	Auto Policies In-Force[(1)]
1993	346,882	2,011,055
1994	384,217	2,147,549
1995	443,539	2,310,037
1996	592,300	2,543,699
1997	868,430	2,949,439
1998	1,249,875	3,562,644
1999	1,648,095	4,328,900
2000	1,472,853	4,696,842

(1) "Voluntary" only; excludes assigned risks and the like.

Agonizing over errors is a mistake. But acknowledging and analyzing them can be useful, though that practice is rare in corporate boardrooms. There, Charlie and I have almost never witnessed a candid post-mortem of a failed decision, *particularly one involving an acquisition.* A notable exception to this never-look-back approach is that of The Washington Post Company, which unfailingly and objectively reviews its acquisitions three years after they are made. Elsewhere, triumphs are trumpeted, but dumb decisions either get no follow-up or are rationalized.

The financial consequences of these boners are regularly dumped into massive restructuring charges or write-offs that are casually waved off as "nonrecurring." Managements just love these. Indeed, in recent years it has seemed that no earnings statement is complete without them. The origins of these charges, though, are never explored. When it comes to corporate blunders, CEOs invoke the concept of the Virgin Birth.

To get back to our examination of GEICO: There are at least four factors that could account for the increased costs we experienced in obtaining new business last year, and all probably contributed in some manner.

First, in our advertising we have pushed "frequency" very hard, and we probably overstepped in certain media. We've always known that increasing the number of messages through any medium would eventually produce diminishing returns. The third ad in an hour on a given cable channel is simply not going to be as effective as the first.

Second, we may have already picked much of the low-hanging fruit. Clearly, the willingness to do business with a direct marketer of insurance varies widely among individuals: Indeed, some percentage of Americans — particularly older ones — are reluctant to make direct purchases of any kind. Over the years, however, this reluctance will ebb. A new generation with new habits will find the savings from direct purchase of their auto insurance too compelling to ignore.

Another factor that surely decreased the conversion of inquiries into sales was stricter underwriting by GEICO. Both the frequency and severity of losses increased during the year, and rates in certain areas became inadequate, in some cases substantially so. In these instances, we necessarily tightened our underwriting standards. This tightening, as well as the many rate increases we put in during the year, made our offerings less attractive to some prospects.

A high percentage of callers, it should be emphasized, can still save money by insuring with us. Understandably, however, some prospects will switch to save $200 per year but will not switch to save $50. Therefore, rate increases that bring our prices closer to those of our competitors will hurt our acceptance rate, even when we continue to offer the best deal.

Finally, the competitive picture changed in at least one important respect: State Farm — by far the largest personal auto insurer, with about 19% of the market — has been very slow to raise prices. Its costs, however, are clearly increasing right along with those of the rest of the industry. Consequently, State Farm had an underwriting loss last year from auto insurance (including rebates to policyholders) of 18% of premiums, compared to 4% at GEICO. Our loss produced a float cost for us of 6.1%, an unsatisfactory result. (Indeed, at GEICO we expect float, over time, to be free.) But we estimate that State Farm's float cost in 2000 was about 23%. The willingness of the largest player in the industry to tolerate such a cost makes the economics difficult for other participants.

That does not take away from the fact that State Farm is one of America's greatest business stories. I've urged that the company be studied at business schools because it has achieved fabulous success while following a path that in many ways defies the dogma of those institutions. Studying counter-evidence is a highly useful activity, though not one always greeted with enthusiasm at citadels of learning.

State Farm was launched in 1922, by a 45-year-old, semi-retired Illinois farmer, to compete with long-established insurers — haughty institutions in New York, Philadelphia and Hartford — that possessed overwhelming advantages in capital, reputation, and distribution. Because State Farm is a mutual company, its board members and managers could not be owners, and it had no access to capital markets during its years of fast growth. Similarly, the business never had the stock options or lavish salaries that many people think vital if an American enterprise is to attract able managers and thrive.

In the end, however, State Farm eclipsed all its competitors. In fact, by 1999 the company had amassed a tangible net worth exceeding that of all but four American businesses. If you want to read how this happened, get a copy of *The Farmer from Merna*.

Despite State Farm's strengths, however, GEICO has much the better business model, one that embodies significantly lower operating costs. And, when a company is selling a product with commodity-like economic characteristics, being the low-cost producer is all-important. This enduring competitive advantage of GEICO — one it possessed in 1951 when, as a 20-year-old student, I first became enamored with its stock — is the reason that over time it will inevitably increase its market share significantly while simultaneously achieving excellent profits. Our growth will be slow, however, if State Farm elects to continue bearing the underwriting losses that it is now suffering.

Tony Nicely, GEICO's CEO, remains an owner's dream. Everything he does makes sense. He never engages in wishful thinking or otherwise distorts reality, as so many managers do when the unexpected happens. As 2000 unfolded, Tony cut back on advertising that was not cost-effective, and he will continue to do that in 2001 if cutbacks are called for (though we will always maintain a *massive* media presence). Tony has also aggressively filed for price increases where we need them. He looks at the loss reports every day and is never behind the curve. To steal a line from a competitor, we are in good hands with Tony.

I've told you about our profit-sharing arrangement at GEICO that targets only two variables — growth in policies and the underwriting results of seasoned business. Despite the headwinds of 2000, we still had a performance that produced an 8.8% profit-sharing payment, amounting to $40.7 million.

GEICO will be a huge part of Berkshire's future. Because of its rock-bottom operating costs, it offers a great many Americans the cheapest way to purchase a high-ticket product that they *must* buy. The company then couples this bargain with service that consistently ranks high in independent surveys. That's a combination inevitably producing growth and profitability.

In just the last few years, *far* more drivers have learned to associate the GEICO brand with saving money on their insurance. We will pound that theme relentlessly until all Americans are aware of the value that we offer.

Investments

Below we present our common stock investments. Those that had a market value of more than $1 billion at the end of 2000 are itemized.

		12/31/00	
Shares	*Company*	*Cost*	*Market*
		(dollars in millions)	
151,610,700	American Express Company	$1,470	$ 8,329
200,000,000	The Coca-Cola Company	1,299	12,188
96,000,000	The Gillette Company	600	3,468
1,727,765	The Washington Post Company	11	1,066
55,071,380	Wells Fargo & Company	319	3,067
	Others	6,703	9,501
	Total Common Stocks	$10,402	$ 37,619

In 2000, we sold nearly all of our Freddie Mac and Fannie Mae shares, established 15% positions in several mid-sized companies, bought the high-yield bonds of a few issuers (very few — the category is not labeled junk without reason) and added to our holdings of high-grade, mortgage-backed securities. There are no "bargains" among our current holdings: We're content with what we own but far from excited by it.

Many people assume that marketable securities are Berkshire's first choice when allocating capital, but that's not true: Ever since we first published our economic principles in 1983, we have consistently stated that we would rather purchase businesses than stocks. (See number 4 on page 60.) One reason for that preference is personal, in that I love working with our managers. They are high-grade, talented and loyal. And, frankly, I find their business behavior to be more rational and owner-oriented than that prevailing at many public companies.

But there's also a powerful financial reason behind the preference, and that has to do with taxes. The tax code makes Berkshire's owning 80% or more of a business far more profitable for us, proportionately, than our owning a smaller share. When a company we own all of earns $1 million after tax, the entire amount inures to our benefit. If the $1 million is upstreamed to Berkshire, we owe no tax on the dividend. And, if the earnings are retained and we were to sell the subsidiary — not likely at Berkshire! — for $1million more than we paid for it, we would owe no capital gains tax. That's because our "tax cost" upon sale would include both what we paid for the business and all earnings it subsequently retained.

Contrast that situation to what happens when we own an investment in a marketable security. There, if we own a 10% stake in a business earning $10 million after tax, our $1 million share of the earnings is subject to *additional* state and federal taxes of (1) about $140,000 if it is distributed to us (our tax rate on most dividends is 14%); or (2) no less than $350,000 if the $1 million is retained and subsequently captured by us in the form of a capital gain (on which our tax rate is usually about 35%, though it sometimes approaches 40%). We may defer paying the $350,000 by not immediately realizing our gain, but eventually we must pay the tax. In effect, the government is our "partner" twice when we own part of a business through a stock investment, but only once when we own at least 80%.

Leaving aside tax factors, the formula we use for evaluating stocks and businesses is identical. Indeed, the formula for valuing *all* assets that are purchased for financial gain has been unchanged since it was first laid out by a very smart man in about 600 B.C. (though he wasn't smart enough to know it was 600 B.C.).

The oracle was Aesop and his enduring, though somewhat incomplete, investment insight was "a bird in the hand is worth two in the bush." To flesh out this principle, you must answer only three questions. How certain are you that there are indeed birds in the bush? When will they emerge and how many will there be? What is the risk-free interest rate (which we consider to be the yield on long-term U.S. bonds)? If you can answer these three questions, you will know the maximum value of the bush — and the maximum number of the birds you now possess that should be offered for it. And, of course, don't literally think birds. Think dollars.

Aesop's investment axiom, thus expanded and converted into dollars, is immutable. It applies to outlays for farms, oil royalties, bonds, stocks, lottery tickets, and manufacturing plants. And neither the advent of the steam engine, the harnessing of electricity nor the creation of the automobile changed the formula one iota — nor will the Internet. Just insert the correct numbers, and you can rank the attractiveness of all possible uses of capital throughout the universe.

Common yardsticks such as dividend yield, the ratio of price to earnings or to book value, and even growth rates have *nothing* to do with valuation except to the extent they provide clues to the amount and timing of cash flows into and from the business. Indeed, growth can destroy value if it requires cash inputs in the early years of a project or enterprise that exceed the discounted value of the cash that those assets will generate in later years. Market commentators and investment managers who glibly refer to "growth" and "value" styles as contrasting approaches to investment are displaying their ignorance, not their sophistication. Growth is simply a component — usually a plus, sometimes a minus — in the value equation.

Alas, though Aesop's proposition and the third variable — that is, interest rates — are simple, plugging in numbers for the other two variables is a difficult task. Using precise numbers is, in fact, foolish; working with a range of possibilities is the better approach.

Usually, the range must be so wide that no useful conclusion can be reached. Occasionally, though, even very conservative estimates about the future emergence of birds reveal that the price quoted is startlingly low in relation to value. (Let's call this phenomenon the IBT — Inefficient Bush Theory.) To be sure, an investor needs some general understanding of business economics as well as the ability to think independently to reach a well-founded positive conclusion. But the investor does not need brilliance nor blinding insights.

At the other extreme, there are many times when the *most* brilliant of investors can't muster a conviction about the birds to emerge, not even when a very broad range of estimates is employed. This kind of uncertainty frequently occurs when new businesses and rapidly changing industries are under examination. In cases of this sort, *any* capital commitment must be labeled speculative.

Now, speculation — in which the focus is not on what an asset will produce but rather on what the next fellow will pay for it — is neither illegal, immoral nor un-American. But it is not a game in which Charlie and I wish to play. We bring nothing to the party, so why should we expect to take anything home?

The line separating investment and speculation, which is never bright and clear, becomes blurred still further when most market participants have recently enjoyed triumphs. Nothing sedates rationality like large doses of effortless money. After a heady experience of that kind, normally sensible people drift into behavior akin to that of Cinderella at the ball. They know that overstaying the festivities — that is, continuing to speculate in companies that have gigantic valuations relative to the cash they are likely to generate in the future — will eventually bring on pumpkins and mice. But they nevertheless hate to miss a single minute of what is one helluva party. Therefore, the giddy participants all plan to leave just seconds before midnight. There's a problem, though: They are dancing in a room in which the clocks have no hands.

Last year, we commented on the exuberance — and, yes, it was irrational — that prevailed, noting that investor expectations had grown to be several multiples of probable returns. One piece of evidence came from a Paine Webber-Gallup survey of investors conducted in December 1999, in which the participants were asked their opinion about the annual returns investors could expect to realize over the decade ahead. Their answers averaged 19%. That, for sure, was an irrational expectation: For American business as a whole, there couldn't possibly be enough birds in the 2009 bush to deliver such a return.

Far more irrational still were the huge valuations that market participants were then putting on businesses almost certain to end up being of modest or no value. Yet investors, mesmerized by soaring stock prices and ignoring all else, piled into these enterprises. It was as if some virus, racing wildly among investment professionals as well as amateurs, induced hallucinations in which the values of stocks in certain sectors became decoupled from the values of the businesses that underlay them.

This surreal scene was accompanied by much loose talk about "value creation." We readily acknowledge that there has been a huge amount of true value created in the past decade by new or young businesses, and that there is much more to come. But value is destroyed, not created, by any business that loses money over its lifetime, no matter how high its interim valuation may get.

What actually occurs in these cases is wealth *transfer*, often on a massive scale. By shamelessly merchandising birdless bushes, promoters have in recent years moved billions of dollars from the pockets of the public to their own purses (and to those of their friends and associates). The fact is that a bubble market has allowed the creation of bubble companies, entities designed more with an eye to making money *off* investors rather than *for* them. Too often, an IPO, not profits, was the primary goal of a company's promoters. At bottom, the "business model" for these companies has been the old-fashioned chain letter, for which many fee-hungry investment bankers acted as eager postmen.

But a pin lies in wait for every bubble. And when the two eventually meet, a new wave of investors learns some very old lessons: First, many in Wall Street — a community in which quality control is not prized — will sell investors anything they will buy. Second, speculation is most dangerous when it looks easiest.

At Berkshire, we make *no* attempt to pick the few winners that will emerge from an ocean of unproven enterprises. We're not smart enough to do that, and we know it. Instead, we try to apply Aesop's 2,600-year-old equation to opportunities in which we have reasonable confidence as to how many birds are in the bush and when they will emerge (a formulation that my grandsons would probably update to "A girl in a convertible is worth five in the phonebook."). Obviously, we can never precisely predict the timing of cash flows in and out of a business or their exact amount. We try, therefore, to keep our estimates conservative and to focus on industries where business surprises are unlikely to wreak havoc on owners. Even so, we make many mistakes: I'm the fellow, remember, who thought he understood the future economics of trading stamps, textiles, shoes and second-tier department stores.

Lately, the most promising "bushes" have been negotiated transactions for entire businesses, and that pleases us. You should clearly understand, however, that these acquisitions will at best provide us only reasonable returns. Really juicy results from negotiated deals can be anticipated only when capital markets are severely constrained and the whole business world is pessimistic. We are 180 degrees from that point.

Sources of Reported Earnings

The table that follows shows the main sources of Berkshire's reported earnings. In this presentation, purchase-accounting adjustments are not assigned to the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. For the reasons discussed on page 65, this form of presentation seems to us to be more useful to investors and managers than one utilizing generally accepted accounting principles (GAAP), which require purchase-premiums to be charged off business-by-business. The total net earnings we show in the table are, of course, identical to the GAAP total in our audited financial statements.

	(in millions)

Most of our manufacturing, retailing and service businesses did at least reasonably well last year.

The exception was shoes, particularly at Dexter. In our shoe businesses generally, our attempt to keep the bulk of our production in domestic factories has cost us dearly. We face another very tough year in 2001 also, as we make significant changes in how we do business.

I clearly made a mistake in paying what I did for Dexter in 1993. Furthermore, I compounded that mistake in a huge way by using Berkshire shares in payment. Last year, to recognize my error, we charged off all the remaining accounting goodwill that was attributable to the Dexter transaction. We may regain some economic goodwill at Dexter in the future, but we clearly have none at present.

The managers of our shoe businesses are first-class from both a business and human perspective. They are working very hard at a tough — and often terribly painful — job, even though their personal financial circumstances don't require them to do so. They have my admiration and thanks.

On a more pleasant note, we continue to be the undisputed leader in two branches of Aircraft Services — pilot training at FlightSafety (FSI) and fractional ownership of business jets at Executive Jet (EJA). Both companies are run by their remarkable founders.

Al Ueltschi at FSI is now 83 and continues to operate at full throttle. Though I am not a fan of stock splits, I am planning to split Al's age 2-for-1 when he hits 100. (If it works, guess who's next.)

We spent $272 million on flight simulators in 2000, and we'll spend a similar amount this year. Anyone who thinks that the annual charges for depreciation don't reflect a real cost — every bit as real as payroll or raw materials — should get an internship at a simulator company. Every year we spend amounts equal to our depreciation charge simply to stay in the same economic place — and then spend additional sums to grow. And growth is in prospect for FSI as far as the eye can see.

Even faster growth awaits EJA (whose fractional-ownership program is called NetJets®). Rich Santulli is the dynamo behind this business.

Last year I told you that EJA's recurring revenue from monthly management fees and hourly usage grew by 46% in 1999. In 2000 the growth was 49%. I also told you that this was a low-margin business, in which survivors will be few. Margins were indeed slim at EJA last year, in part because of the major costs we are incurring in developing our business in Europe.

Regardless of the cost, you can be sure that EJA's spending on safety will be whatever is needed. Obviously, we would follow this policy under any circumstances, but there's some self-interest here as well: I, my wife, my children, my sisters, my 94-year-old aunt, all but one of our directors, and at least nine Berkshire managers regularly fly in the NetJets program. Given that cargo, I applaud Rich's insistence on unusually high amounts of pilot training (an average of 23 days a year). In addition, our pilots cement their skills by flying 800 or so hours a year. Finally, each flies only one model of aircraft, which means our crews do no switching around among planes with different cockpit and flight characteristics.

EJA's business continues to be constrained by the availability of new aircraft. Still, our customers will take delivery of more than 50 new jets in 2001, 7% of world output. We are confident we will remain the world leader in fractional ownership, in respect to number of planes flying, quality of service, and standards of safety.

* * * * * * * * * *

Additional information about our various businesses is given on pages 42-58, where you will also find our segment earnings reported on a GAAP basis. In addition, on pages 67-73, we have rearranged Berkshire's financial data into four segments on a non-GAAP basis, a presentation that corresponds to the way Charlie and I think about the company.

Look-Through Earnings

Reported earnings are an inadequate measure of economic progress at Berkshire, in part because the numbers shown in the table on page 15 include only the dividends we receive from investees — though these dividends typically represent only a small fraction of the earnings attributable to our ownership. To depict something closer to economic reality at Berkshire than reported earnings, though, we employ the concept of "look-through" earnings. As we calculate these, they consist of: (1) the operating earnings reported on page 15; plus; (2) our share of the retained operating earnings of major investees that, under GAAP accounting, are not reflected in our profits, less; (3) an allowance for the tax that would be paid by Berkshire if these retained earnings of investees had instead been distributed to us. When tabulating "operating earnings" here, we exclude purchase-accounting adjustments as well as capital gains and other major non-recurring items.

The following table sets forth our 2000 look-through earnings, though I warn you that the figures can be no more than approximate, since they are based on a number of judgment calls. (The dividends paid to us by these investees have been included in the operating earnings itemized on page 15, mostly under "Insurance Group: Net Investment Income.")

Berkshire's Major Investees	Berkshire's Approximate Ownership at Yearend[1]	Berkshire's Share of Undistributed Operating Earnings (in millions)[2]
American Express Company	11.4%	$265
The Coca-Cola Company	8.1%	160
Freddie Mac	0.3%	106
The Gillette Company	9.1%	51
M&T Bank	7.2%	23
The Washington Post Company	18.3%	18
Wells Fargo & Company	3.2%	117
Berkshire's share of undistributed earnings of major investees		740
Hypothetical tax on these undistributed investee earnings[3]		(104)
Reported operating earnings of Berkshire		1,779
Total look-through earnings of Berkshire		$ 2,415

(1) Does not include shares allocable to minority interests
(2) Calculated on average ownership for the year
(3) The tax rate used is 14%, which is the rate Berkshire pays on most dividends it receives

Full and Fair Reporting

At Berkshire, full reporting means giving you the information that we would wish you to give to us if our positions were reversed. What Charlie and I would want under that circumstance would be all the important facts about current operations as well as the CEO's frank view of the long-term economic characteristics of the business. We would expect both a lot of financial details and a discussion of any significant data we would need to interpret what was presented.

When Charlie and I read reports, we have no interest in pictures of personnel, plants or products. References to EBITDA make us shudder — does management think the tooth fairy pays for capital expenditures? We're very suspicious of accounting methodology that is vague or unclear, since too often that means management wishes to hide something. And we don't want to read messages that a public relations department or consultant has turned out. Instead, we expect a company's CEO to explain in his or her own words what's happening.

For us, fair reporting means getting information to our 300,000 "partners" simultaneously, or as close to that mark as possible. We therefore put our annual and quarterly financials on the Internet between the close of the market on a Friday and the following morning. By our doing that, shareholders and other interested investors have timely access to these important releases and also have a reasonable amount of time to digest the information they include before the markets open on Monday. This year our quarterly information will be available on the Saturdays of May 12, August 11, and November 10. The 2001 annual report will be posted on March 9.

We applaud the work that Arthur Levitt, Jr., until recently Chairman of the SEC, has done in cracking down on the corporate practice of "selective disclosure" that had spread like cancer in recent years. Indeed, it had become virtually standard practice for major corporations to "guide" analysts or large holders to earnings expectations that were intended either to be on the nose or a tiny bit below what the company truly expected to earn. Through the selectively dispersed hints, winks and nods that companies engaged in, speculatively-minded institutions and advisors were given an information edge over investment-oriented individuals. This was corrupt behavior, unfortunately embraced by both Wall Street and corporate America.

Thanks to Chairman Levitt, whose general efforts on behalf of investors were both tireless and effective, corporations are now required to treat all of their owners equally. The fact that this reform came about because of coercion rather than conscience should be a matter of shame for CEOs and their investor relations departments.

One further thought while I'm on my soapbox: Charlie and I think it is both deceptive and dangerous for CEOs to predict growth rates for their companies. They are, of course, frequently egged on to do so by both analysts and their own investor relations departments. They should resist, however, because too often these predictions lead to trouble.

It's fine for a CEO to have his own internal goals and, in our view, it's even appropriate for the CEO to publicly express some hopes about the future, if these expectations are accompanied by sensible caveats. But for a major corporation to predict that its per-share earnings will grow over the long term at, say, 15% annually is to court trouble.

That's true because a growth rate of that magnitude can only be maintained by a very small percentage of large businesses. Here's a test: Examine the record of, say, the 200 highest earning companies from 1970 or 1980 and tabulate how many have increased per-share earnings by 15% annually since those dates. You will find that only a handful have. I would wager you a very significant sum that fewer than 10 of the 200 most profitable companies in 2000 will attain 15% annual growth in earnings-per-share over the next 20 years.

The problem arising from lofty predictions is not just that they spread unwarranted optimism. Even more troublesome is the fact that they corrode CEO behavior. Over the years, Charlie and I have observed many instances in which CEOs engaged in uneconomic operating maneuvers so that they could meet earnings targets they had announced. Worse still, after exhausting all that operating acrobatics would do, they sometimes played a wide variety of accounting games to "make the numbers." These accounting shenanigans have a way of snowballing: Once a company moves earnings from one period to another, operating shortfalls that occur thereafter require it to engage in further accounting maneuvers that must be even more "heroic." These can turn fudging into fraud. (More money, it has been noted, has been stolen with the point of a pen than at the point of a gun.)

Charlie and I tend to be leery of companies run by CEOs who woo investors with fancy predictions. A few of these managers will prove prophetic — but others will turn out to be congenital optimists, or even charlatans. Unfortunately, it's not easy for investors to know in advance which species they are dealing with.

* * * * * * * * * * * *

I've warned you in the past that you should not believe everything you read or hear about Berkshire — even when it is published or broadcast by a prestigious news organization. Indeed, erroneous reports are particularly dangerous when they are circulated by highly-respected members of the media, simply because most readers and listeners know these outlets to be generally credible and therefore believe what they say.

An example is a glaring error about Berkshire's activities that appeared in the December 29 issue of *The Wall Street Journal*, a generally excellent paper that I have for all of my life found useful. On the front page (and above the fold, as they say) *The Journal* published a news brief that said, in unequivocal terms, that we were buying bonds of Conseco and Finova. This item directed the reader to the lead story of the Money and Investing section. There, in the second paragraph of the story, *The Journal* reported, *again without any qualification*, that Berkshire was buying Conseco and Finova bonds, adding that Berkshire had invested "several hundred million dollars" in each. Only in the 18th paragraph of the story (which by that point had jumped to an inside page) did the paper hedge a bit, saying that our Conseco purchases had been disclosed by "people familiar with the matter."

Well, not *that* familiar. True, we had purchased bonds and bank debt of Finova — though the report was wildly inaccurate as to the amount. But to this day neither Berkshire nor I have *ever* bought a share of stock or a bond of Conseco.

Berkshire is normally covered by a *Journal* reporter in Chicago who is both accurate and conscientious. In this case, however, the "scoop" was the product of a New York reporter for the paper. Indeed, the 29th was a busy day for him: By early afternoon, he had repeated the story on CNBC. Immediately, in lemming-like manner, other respected news organizations, relying solely on the *Journal*, began relating the same "facts." The result: Conseco stock advanced sharply during the day on exceptional volume that placed it ninth on the NYSE most-active list.

During all of the story's iterations, I never heard or read the word "rumor." Apparently reporters and editors, who generally pride themselves on their careful use of language, just can't bring themselves to attach this word to their accounts. But what description would fit more precisely? Certainly not the usual "sources say" or "it has been reported."

A column entitled "Today's Rumors," however, would not equate with the self-image of the many news organizations that think themselves above such stuff. These members of the media would feel that publishing such acknowledged fluff would be akin to *L'Osservatore Romano* initiating a gossip column. But rumors are what these organizations often publish and broadcast, whatever euphemism they duck behind. At a minimum, readers deserve honest terminology — a warning label that will protect their financial health in the same way that smokers whose physical health is at risk are given a warning.

The Constitution's First Amendment allows the media to print or say almost anything. Journalism's First Principle should require that the media be scrupulous in deciding what that will be.

Miscellaneous

In last year's report we examined the battle then raging over the use of "pooling" in accounting for mergers. It seemed to us that both sides were voicing arguments that were strong in certain respects and seriously flawed in others. We are pleased that the Financial Accounting Standards Board has since gone to an alternative approach that strikes us as very sound.

If the proposed rule becomes final, we will no longer incur a large annual charge for amortization of intangibles. Consequently, our reported earnings will more closely reflect economic reality. (See page 65.) None of this will have an effect on Berkshire's intrinsic value. Your Chairman, however, will personally benefit in that there will be one less item to explain in these letters.

* * * * * * * * * * * *

I'm enclosing a report — generously supplied by *Outstanding Investor Digest* — of Charlie's remarks at last May's Wesco annual meeting. Charlie thinks about business economics and investment matters better than anyone I know, and I've learned a lot over the years by listening to him. Reading his comments will improve your understanding of Berkshire.

* * * * * * * * * * * *

In 1985, we purchased Scott Fetzer, acquiring not only a fine business but the services of Ralph Schey, a truly outstanding CEO, as well. Ralph was then 61. Most companies, focused on the calendar rather than ability, would have benefited from Ralph's talents for only a few years.

At Berkshire, in contrast, Ralph ran Scott Fetzer for 15 years until his retirement at the end of 2000. Under his leadership, the company distributed $1.03 billion to Berkshire against our net purchase price of $230 million. We used these funds, in turn, to purchase other businesses. All told, Ralph's contributions to Berkshire's present value extend well into the billions of dollars.

As a manager, Ralph belongs in Berkshire's Hall of Fame, and Charlie and I welcome him to it.

* * * * * * * * * * * *

A bit of nostalgia: It was exactly 50 years ago that I entered Ben Graham's class at Columbia. During the decade before, I had enjoyed — make that *loved* ¾ analyzing, buying and selling stocks. But my results were no better than average.

Beginning in 1951 my performance improved. No, I hadn't changed my diet or taken up exercise. The only new ingredient was Ben's ideas. Quite simply, a few hours spent at the feet of the master proved far more valuable to me than had ten years of supposedly original thinking.

In addition to being a great teacher, Ben was a wonderful friend. My debt to him is incalculable.

Shareholder-Designated Contributions

About 97% of all eligible shares participated in Berkshire's 2000 shareholder-designated contributions program, with contributions totaling $16.9 million. A full description of the program appears on pages 74-75.

Cumulatively, over the 20 years of the program, Berkshire has made contributions of $164 million pursuant to the instructions of our shareholders. The rest of Berkshire's giving is done by our subsidiaries, which stick to the philanthropic patterns that prevailed before they were acquired (except that their former owners themselves take on the responsibility for their personal charities). In aggregate, our subsidiaries made contributions of $18.3 million in 2000, including in-kind donations of $3 million.

To participate in future programs, you must own Class A shares that are registered in the name of the actual owner, not the nominee name of a broker, bank or depository. Shares not so registered on August 31, 2001 will be ineligible for the 2001 program. When you get the contributions form from us, return it promptly so that it does not get put aside or forgotten. Designations received after the due date will not be honored.

The Annual Meeting

Last year we moved the annual meeting to the Civic Auditorium, and it worked very well for us. We will meet there again on Saturday, April 28. The doors will open at 7 a.m., the movie will begin at 8:30, and the meeting itself will commence at 9:30. There will be a short break at noon for food, with sandwiches available at the Civic's concession stands. Except for that interlude, Charlie and I will answer questions until 3:30.

For the next couple of years, the Civic is our only choice. We must therefore hold the meeting on either Saturday or Sunday to avoid the traffic and parking nightmare that would occur on a weekday. Shortly, however, Omaha will have a new Convention Center with ample parking. Assuming that the Center is then available to us, I will poll shareholders to see whether you wish to return to a Monday meeting. We will decide that vote based on the wishes of a majority of shareholders, not shares.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to this year's meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. In our normal fashion, we will run buses from the larger hotels to the meeting. After the meeting, the buses will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

We have added so many new companies to Berkshire this year that I'm not going to detail all of the products that we will be *selling* at the meeting. But come prepared to carry home everything from bricks to candy. One new product, however, deserves special note: Bob Shaw has designed a 3 x 5 rug featuring an excellent likeness of Charlie. Obviously, it would be embarrassing for Charlie — make that humiliating — if slow sales forced us to slash the rug's price, so step up and do your part.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to offer you a special shareholder's discount (usually 8%). Bring the details of your existing insurance and check out whether we can save you some money.

At the Omaha airport on Saturday, we will have the usual array of aircraft from Executive Jet available for your inspection. Just ask an EJA representative at the Civic about viewing any of these planes. If you buy what we consider an appropriate number of items during the weekend, you may well need your own plane to take them home.

At Nebraska Furniture Mart, located on a 75-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing, which means we will be offering our shareholders a discount that is customarily given only to employees. We initiated this special pricing at NFM four years ago and sales during the "Weekend" grew from $5.3 million in 1997 to $9.1 million in 2000.

To get the discount, you must make your purchases between Wednesday, April 25 and Monday, April 30 and also present your meeting credential. The period's special pricing will even apply to the products of several prestige manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. on weekdays and 10 a.m. to 6 p.m. on Saturdays and Sundays.

Borsheim's — the largest jewelry store in the country except for Tiffany's Manhattan store — will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, April 27. The second, the main gala, will be from 9 a.m. to 5 p.m. on Sunday, April 29. Shareholder prices will be available Thursday through Monday, so if you wish to avoid the large crowds that will assemble on Friday evening and Sunday, come at other times and identify yourself as a shareholder. On Saturday, we will be open until 6 p.m. Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, so the more you buy, the more you save (or at least that's what my family always tells me).

In the mall outside of Borsheim's, we will have local bridge experts available to play with our shareholders on Sunday. Bob Hamman, who normally is with us, will be in Africa this year. He has promised, however, to be on hand in 2002. Patrick Wolff, twice U.S. chess champion, will also be in the mall, taking on all comers — blindfolded! Last year, Patrick played as many as six games simultaneously — with his blindfold securely in place — and demolished his opponents.

As if all this isn't enough to test your skills, our Borsheim's Olympiad this year will also include Bill Robertie, one of only two players to twice win the backgammon world championship. Backgammon can be a big money game, so bring along your stock certificates.

Gorat's — my favorite steakhouse — will again be open exclusively for Berkshire shareholders on Sunday, April 29, and will be serving from 4 p.m. until 10 p.m. Please remember that you can't come to Gorat's on Sunday without a reservation. To make one, call 402-551-3733 on April 2 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. If you order a rare T-bone with a double order of hash browns, you will establish your credentials as an epicure.

The usual baseball game will be held at Rosenblatt Stadium at 7 p.m. on Saturday night. This year the Omaha Golden Spikes will play the New Orleans Zephyrs. Ernie Banks is again going to be on hand to — bravely — face my fastball (once clocked at 95 mpm — miles per month).

My performance last year was not my best: It took me five pitches to throw anything resembling a strike. And, believe me, it gets lonely on the mound when you can't find the plate. Finally, I got one over, and Ernie lashed a line drive to left field. After I was yanked from the game, the many sports writers present asked what I had served up to Ernie. I quoted what Warren Spahn said after Willie Mays hit one of his pitches for a home run (Willie's first in the majors): "It was a helluva pitch for the first sixty feet."

It will be a different story this year. I don't want to tip my hand, so let's just say Ernie will have to deal with a pitch he has never seen before.

Our proxy statement contains instructions about obtaining tickets to the game and also a large quantity of other information that should help you enjoy your visit in Omaha. There will be plenty of action in town. So come for Woodstock Weekend and join our Celebration of Capitalism at the Civic.

Warren E. Buffett
February 28, 2001 Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
2001	(6.2)	(11.9)	5.7
Average Annual Gain – 1965-2001	22.6%	11.0%	11.6%
Overall Gain – 1964-2001	194,936%	4,742%	190,194%

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Berkshire's *loss* in net worth during 2001 was $3.77 billion, which decreased the per-share book value of both our Class A and Class B stock by 6.2%. Over the last 37 years (that is, since present management took over) per-share book value has grown from $19 to $37,920, a rate of 22.6% compounded annually.*

Per-share intrinsic grew somewhat faster than book value during these 37 years, and in 2001 it probably decreased a bit less. We explain intrinsic value in our Owner's Manual, which begins on page 62. I urge new shareholders to read this manual to become familiar with Berkshire's key economic principles.

Two years ago, reporting on 1999, I said that we had experienced both the worst absolute and relative performance in our history. I added that "relative results are what concern us," a viewpoint I've had since forming my first investment partnership on May 5, 1956. Meeting with my seven founding limited partners that evening, I gave them a short paper titled "The Ground Rules" that included this sentence: "Whether we do a good job or a poor job is to be measured against the general experience in securities." We initially used the Dow Jones Industrials as our benchmark, but shifted to the S&P 500 when that index became widely used. Our comparative record since 1965 is chronicled on the facing page; last year Berkshire's advantage was 5.7 percentage points.

Some people disagree with our focus on relative figures, arguing that "you can't eat relative performance." But if you expect – as Charlie Munger, Berkshire's Vice Chairman, and I do – that owning the S&P 500 will produce reasonably satisfactory results over time, it follows that, for long-term investors, gaining small advantages annually over that index *must* prove rewarding. Just as you can eat well throughout the year if you own a profitable, but highly seasonal, business such as See's (which loses considerable money during the summer months) so, too, can you regularly feast on investment returns that beat the averages, however variable the absolute numbers may be.

Though our corporate performance last year was satisfactory, *my* performance was anything but. I manage most of Berkshire's equity portfolio, and my results were poor, just as they have been for several years. Of even more importance, I allowed General Re to take on business without a safeguard I knew was important, and on September 11th, this error caught up with us. I'll tell you more about my mistake later and what we are doing to correct it.

Another of my 1956 Ground Rules remains applicable: "I cannot promise results to partners." But Charlie and I *can* promise that your economic result from Berkshire will parallel ours during the period of your ownership: We will not take cash compensation, restricted stock or option grants that would make our results superior to yours.

Additionally, I will keep well over 99% of my net worth in Berkshire. My wife and I have never sold a share nor do we intend to. Charlie and I are disgusted by the situation, so common in the last few years, in which shareholders have suffered billions in losses while the CEOs, promoters, and other higher-ups who fathered these disasters have walked away with extraordinary wealth. Indeed, many of these people were urging investors to buy shares while concurrently dumping their own, sometimes using methods that hid their actions. To their shame, these business leaders view shareholders as patsies, not partners.

Though Enron has become the symbol for shareholder abuse, there is no shortage of egregious conduct elsewhere in corporate America. One story I've heard illustrates the all-too-common attitude of managers toward

*All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an ec onomic interest equal to 1/30th that of the A.

owners: A gorgeous woman slinks up to a CEO at a party and through moist lips purrs, "I'll do anything – *anything* – you want. Just tell me what you would like." With no hesitation, he replies, "Reprice my options."

One final thought about Berkshire: In the future we won't come close to replicating our past record. To be sure, Charlie and I will strive for above-average performance and will not be satisfied with less. But two conditions at Berkshire are far different from what they once were: Then, we could often buy businesses and securities at much lower valuations than now prevail; and more important, we were then working with far less money than we now have. Some years back, a good $10 million idea could do wonders for us (witness our investment in Washington Post in 1973 or GEICO in 1976). Today, the combination of *ten* such ideas and a triple in the value of *each* would increase the net worth of Berkshire by only ¼ of 1%. We need "elephants" to make significant gains now – and they are hard to find.

On the positive side, we have as fine an array of operating managers as exists at any company. (You can read about many of them in a new book by Robert P. Miles: *The Warren Buffett CEO*.) In large part, moreover, they are running businesses with economic characteristics ranging from good to superb. The ability, energy and loyalty of these managers is simply extraordinary. We now have completed 37 Berkshire years without having a CEO of an operating business elect to leave us to work elsewhere.

Our star-studded group grew in 2001. First, we completed the purchases of two businesses that we had agreed to buy in 2000 – Shaw and Johns Manville. Then we acquired two others, MiTek and XTRA, and contracted to buy two more: Larson-Juhl, an acquisition that has just closed, and Fruit of the Loom, which will close shortly if creditors approve our offer. All of these businesses are led by smart, seasoned and trustworthy CEOs.

Additionally, all of our purchases last year were for cash, which means our shareholders became owners of these additional businesses without relinquishing any interest in the fine companies they already owned. We will continue to follow our familiar formula, striving to increase the value of the excellent businesses we have, adding new businesses of similar quality, and issuing shares only grudgingly.

Acquisitions of 2001

A few days before last year's annual meeting, I received a heavy package from St. Louis, containing an unprepossessing chunk of metal whose function I couldn't imagine. There was a letter in the package, though, from Gene Toombs, CEO of a company called MiTek. He explained that MiTek is the world's leading producer of this thing I'd received, a "connector plate," which is used in making roofing trusses. Gene also said that the U.K. parent of MiTek wished to sell the company and that Berkshire seemed to him the ideal buyer. Liking the sound of his letter, I gave Gene a call. It took me only a minute to realize that he was our kind of manager and MiTek our kind of business. We made a cash offer to the U.K. owner and before long had a deal.

Gene's managerial crew is exceptionally enthusiastic about the company and wanted to participate in the purchase. Therefore, we arranged for 55 members of the MiTek team to buy 10% of the company, with each putting up a minimum of $100,000 in cash. Many borrowed money so they could participate.

As they would *not* be if they had options, all of these managers are true *owners*. They face the downside of decisions as well as the upside. They incur a cost of capital. And they can't "reprice" their stakes: What they paid is what they live with.

Charlie and I love the high-grade, truly entrepreneurial attitude that exists at MiTek, and we predict it will be a winner for all involved.

* * * * * * * * * * * *

In early 2000, my friend, Julian Robertson, announced that he would terminate his investment partnership, Tiger Fund, and that he would liquidate it entirely except for four large holdings. One of these was XTRA, a leading lessor of truck trailers. I then called Julian, asking whether he might consider selling his XTRA block or whether, for that matter, the company's management might entertain an offer for the entire company. Julian referred me to Lew Rubin, XTRA's CEO. He and I had a nice conversation, but it was apparent that no deal was to be done.

Then in June 2001, Julian called to say that he had decided to sell his XTRA shares, and I resumed conversations with Lew. The XTRA board accepted a proposal we made, which was to be effectuated through a tender offer expiring on September 11th. The tender conditions included the usual "out," allowing us to withdraw if

the stock market were to close before the offer's expiration. Throughout much of the 11th, Lew went through a particularly wrenching experience: First, he had a son-in-law working in the World Trade Center who couldn't be located; and second, he knew we had the option of backing away from our purchase. The story ended happily: Lew's son-in-law escaped serious harm, and Berkshire completed the transaction.

Trailer leasing is a cyclical business but one in which we should earn decent returns over time. Lew brings a new talent to Berkshire, and we hope to expand in leasing.

* * * * * * * * * * * *

On December 3rd, I received a call from Craig Ponzio, owner of Larson-Juhl, the U.S. leader in custom-made picture frames. Craig had bought the company in 1981 (after first working at its manufacturing plant while attending college) and thereafter increased its sales from $3 million to $300 million. Though I had never heard of Larson-Juhl before Craig's call, a few minutes talk with him made me think we would strike a deal. He was straightforward in describing the business, cared about who bought it, and was realistic as to price. Two days later, Craig and Steve McKenzie, his CEO, came to Omaha and in ninety minutes we reached an agreement. In ten days we had signed a contract.

Larson-Juhl serves about 18,000 framing shops in the U.S. and is also the industry leader in Canada and much of Europe. We expect to see opportunities for making complementary acquisitions in the future.

* * * * * * * * * * * *

As I write this letter, creditors are considering an offer we have made for Fruit of the Loom. The company entered bankruptcy a few years back, a victim both of too much debt and poor management. And, a good many years before that, I had some Fruit of the Loom experience of my own.

In August 1955, I was one of five employees, including two secretaries, working for the three managers of Graham-Newman Corporation, a New York investment company. Graham-Newman controlled Philadelphia and Reading Coal and Iron ("P&R"), an anthracite producer that had excess cash, a tax loss carryforward, and a declining business. At the time, I had a significant portion of my limited net worth invested in P&R shares, reflecting my faith in the business talents of my bosses, Ben Graham, Jerry Newman and Howard (Micky) Newman.

This faith was rewarded when P&R purchased the Union Underwear Company from Jack Goldfarb for $15 million. Union (though it was then only a licensee of the name) produced Fruit of the Loom underwear. The company possessed $5 million in cash – $2.5 million of which P&R used for the purchase – and was earning about $3 million pre-tax, earnings that could be sheltered by the tax position of P&R. And, oh yes: Fully $9 million of the remaining $12.5 million due was satisfied by non-interest-bearing notes, payable from 50% of any earnings Union had in excess of $1 million. (*Those* were the days; I get goosebumps just thinking about such deals.)

Subsequently, Union bought the licensor of the Fruit of the Loom name and, along with P&R, was merged into Northwest Industries. Fruit went on to achieve annual pre-tax earnings exceeding $200 million.

John Holland was responsible for Fruit's operations in its most bountiful years. In 1996, however, John retired, and management loaded the company with debt, in part to make a series of acquisitions that proved disappointing. Bankruptcy followed. John was then rehired, and he undertook a major reworking of operations. Before John's return, deliveries were chaotic, costs soared and relations with key customers deteriorated. While correcting these problems, John also reduced employment from a bloated 40,000 to 23,000. In short, he's been restoring the old Fruit of the Loom, albeit in a much more competitive environment.

Stepping into Fruit's bankruptcy proceedings, we made a proposal to creditors to which we attached no financing conditions, even though our offer had to remain outstanding for many months. We did, however, insist on a very unusual proviso: John had to be available to continue serving as CEO after we took over. To us, John and the brand are Fruit's key assets.

I was helped in this transaction by my friend and former boss, Micky Newman, now 81. What goes around truly does come around.

* * * * * * * * * * * *

Our operating companies made several "bolt-on" acquisitions during the year, and I can't resist telling you about one. In December, Frank Rooney called to tell me H.H. Brown was buying the inventory and trademarks of Acme Boot for $700,000.

That sounds like small potatoes. But – would you believe it? – Acme was the second purchase of P&R, an acquisition that took place just before I left Graham-Newman in the spring of 1956. The price was $3.2 million, part of it again paid with non-interest bearing notes, for a business with sales of $7 million.

After P&R merged with Northwest, Acme grew to be the world's largest bootmaker, delivering annual profits many multiples of what the company had cost P&R. But the business eventually hit the skids and never recovered, and that resulted in our purchasing Acme's remnants.

In the frontispiece to *Security Analysis*, Ben Graham and Dave Dodd quoted Horace: "Many shall be restored that now are fallen and many shall fall that are now in honor." Fifty-two years after I first read those lines, my appreciation for what they say about business and investments continues to grow.

* * * * * * * * * * * *

In addition to bolt-on acquisitions, our managers continually look for ways to grow internally. In that regard, here's a postscript to a story I told you two years ago about R.C. Willey's move to Boise. As you may remember, Bill Child, R.C. Willey's chairman, wanted to extend his home-furnishings operation beyond Utah, a state in which his company does more than $300 million of business (up, it should be noted, from $250,000 when Bill took over 48 years ago). The company achieved this dominant position, moreover, with a "closed on Sunday" policy that defied conventional retailing wisdom. I was skeptical that this policy could succeed in Boise or, for that matter, anyplace outside of Utah. After all, Sunday is the day many consumers most like to shop.

Bill then insisted on something extraordinary: He would invest $11 million of his own money to build the Boise store and would sell it to Berkshire at cost (without interest!) if the venture succeeded. If it failed, Bill would keep the store and eat the loss on its disposal. As I told you in the 1999 annual report, the store immediately became a huge success — and it has since grown.

Shortly after the Boise opening, Bill suggested we try Las Vegas, and this time I was even more skeptical. How could we do business in a metropolis of that size and be closed on Sundays, a day that all of our competitors would be exploiting? Buoyed by the Boise experience, however, we proceeded to locate in Henderson, a mushrooming city adjacent to Las Vegas.

The result: This store outsells all others in the R.C. Willey chain, doing a volume of business that far exceeds the volume of any competitor and that is twice what I had anticipated. I cut the ribbon at the grand opening in October – this was after a "soft" opening and a few weeks of exceptional sales – and, just as I did at Boise, I suggested to the crowd that the new store was my idea.

It didn't work. Today, when I pontificate about retailing, Berkshire people just say, "What does Bill think?" (I'm going to draw the line, however, if he suggests that we also close on Saturdays.)

The Economics of Property/Casualty Insurance

Our main business — though we have others of great importance — is insurance. To understand Berkshire, therefore, it is necessary that you understand how to evaluate an insurance company. The key determinants are: (1) the amount of float that the business generates; (2) its cost; and (3) most critical of all, the long-term outlook for both of these factors.

To begin with, float is money we hold but don't own. In an insurance operation, float arises because premiums are received before losses are paid, an interval that sometimes extends over many years. During that time, the insurer invests the money. This pleasant activity typically carries with it a downside: The premiums that an insurer takes in usually do not cover the losses and expenses it eventually must pay. That leaves it running an "underwriting loss," which is the cost of float. An insurance business has value if its cost of float over time is less than the cost the company would otherwise incur to obtain funds. But the business is a lemon if its cost of float is higher than market rates for money.

Historically, Berkshire has obtained its float at a very low cost. Indeed, our cost has been less than zero in about half of the years in which we've operated; that is, we've actually been paid for holding other people's money. Over the last few years, however, our cost has been too high, and in 2001 it was terrible.

The table that follows shows (at intervals) the float generated by the various segments of Berkshire's insurance operations since we entered the business 35 years ago upon acquiring National Indemnity Company (whose traditional lines are included in the segment "Other Primary"). For the table we have calculated our float — which we generate in large amounts relative to our premium volume — by adding net loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves, and then subtracting insurance-related receivables, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. (Got that?)

Yearend Float (in $ millions)

Year	GEICO	General Re	Other Reinsurance	Other Primary	Total
1967				20	20
1977			40	131	171
1987			701	807	1,508
1997	2,917		4,014	455	7,386
1998	3,125	14,909	4,305	415	22,754
1999	3,444	15,166	6,285	403	25,298
2000	3,943	15,525	7,805	598	27,871
2001	4,251	19,310	11,262	685	35,508

Last year I told you that, barring a mega-catastrophe, our cost of float would probably drop from its 2000 level of 6%. I had in mind natural catastrophes when I said that, but instead we were hit by a man-made catastrophe on September 11th – an event that delivered the insurance industry its largest loss in history. Our float cost therefore came in at a staggering 12.8%. It was our worst year in float cost since 1984, and a result that to a significant degree, as I will explain in the next section, we brought upon ourselves.

If no mega-catastrophe occurs, I – once again – expect the cost of our float to be low in the coming year. We will indeed need a low cost, as will *all* insurers. Some years back, float costing, say, 4% was tolerable because government bonds yielded twice as much, and stocks prospectively offered still loftier returns. Today, fat returns are nowhere to be found (at least *we* can't find them) and short-term funds earn less than 2%. Under these conditions, each of our insurance operations, save one, must deliver an underwriting profit if it is to be judged a good business. The exception is our retroactive reinsurance operation (a business we explained in last year's annual report), which has desirable economics even though it currently hits us with an annual underwriting loss of about $425 million.

Principles of Insurance Underwriting

When property/casualty companies are judged by their cost of float, very few stack up as satisfactory businesses. And interestingly – unlike the situation prevailing in many other industries – neither size nor brand name determines an insurer's profitability. Indeed, many of the biggest and best-known companies regularly deliver mediocre results. What counts in this business is underwriting discipline. The winners are those that unfailingly stick to three key principles:

1. *They accept only those risks that they are able to properly evaluate (staying within their circle of competence) and that, after they have evaluated all relevant factors including remote loss scenarios, carry the expectancy of profit. These insurers ignore market-share considerations and are sanguine about losing business to competitors that are offering foolish prices or policy conditions.*

2. *They limit the business they accept in a manner that guarantees they will suffer no aggregation of losses from a single event or from related events that will threaten their solvency. They ceaselessly search for possible correlation among seemingly-unrelated risks.*

3. *They avoid business involving moral risk: No matter what the rate, trying to write good contracts with bad people doesn't work. While most policyholders and clients are honorable and ethical, doing business with the few exceptions is usually expensive, sometimes extraordinarily so.*

The events of September 11th made it clear that our implementation of rules 1 and 2 at General Re had been dangerously weak. In setting prices and also in evaluating aggregation risk, we had either overlooked or dismissed the possibility of large-scale terrorism losses. That was a relevant underwriting factor, and we ignored it.

In pricing property coverages, for example, we had looked to the past and taken into account only costs we might expect to incur from windstorm, fire, explosion and earthquake. But what will be the largest insured property loss in history (after adding related business-interruption claims) originated from none of these forces. In short, all of us in the industry made a fundamental underwriting mistake by focusing on experience, rather than exposure, thereby assuming a huge terrorism risk for which we received no premium.

Experience, of course, is a highly useful starting point in underwriting most coverages. For example, it's important for insurers writing California earthquake policies to know how many quakes in the state during the past century have registered 6.0 or greater on the Richter scale. This information will not tell you the exact probability of a big quake next year, or where in the state it might happen. But the statistic has utility, particularly if you are writing a huge statewide policy, as National Indemnity has done in recent years.

At certain times, however, using experience as a guide to pricing is not only useless, but actually dangerous. Late in a bull market, for example, large losses from directors and officers liability insurance ("D&O") are likely to be relatively rare. When stocks are rising, there are a scarcity of targets to sue, and both questionable accounting and management chicanery often go undetected. At that juncture, experience on high-limit D&O may look great.

But that's just when *exposure* is likely to be exploding, by way of ridiculous public offerings, earnings manipulation, chain-letter-like stock promotions and a potpourri of other unsavory activities. When stocks fall, these sins surface, hammering investors with losses that can run into the hundreds of billions. Juries deciding whether those losses should be borne by small investors or big insurance companies can be expected to hit insurers with verdicts that bear little relation to those delivered in bull-market days. Even one jumbo judgment, moreover, can cause settlement costs in later cases to mushroom. Consequently, the correct rate for D&O "excess" (meaning the insurer or reinsurer will pay losses above a high threshold) might well, if based on *exposure*, be five or more times the premium dictated by *experience*.

Insurers have always found it costly to ignore new exposures. Doing that in the case of terrorism, however, could literally bankrupt the industry. No one knows the probability of a nuclear detonation in a major metropolis this year (or even multiple detonations, given that a terrorist organization able to construct one bomb might not stop there). Nor can anyone, with assurance, assess the probability in this year, or another, of deadly biological or chemical agents being introduced simultaneously (say, through ventilation systems) into multiple office buildings and manufacturing plants. An attack like that would produce astronomical workers' compensation claims.

Here's what we *do* know:

(a) The probability of such mind-boggling disasters, though likely very low at present, is not zero.

(b) The probabilities are increasing, in an irregular and immeasurable manner, as knowledge and materials become available to those who wish us ill. Fear may recede with time, but the danger won't – the war against terrorism can never be won. The best the nation can achieve is a long succession of stalemates. There can be no checkmate against hydra-headed foes.

(c) Until now, insurers and reinsurers have blithely assumed the financial consequences from the incalculable risks I have described.

(d) Under a "close-to-worst-case" scenario, which could conceivably involve $1 trillion of damage, the insurance industry would be destroyed unless it manages in some manner to dramatically limit its assumption of terrorism risks. Only the U.S. Government has the resources to absorb such a blow. If it is unwilling to do so on a prospective basis, the general citizenry must bear its own risks and count on the Government to come to its rescue after a disaster occurs.

Why, you might ask, didn't I recognize the above facts *before* September 11th? The answer, sadly, is that I did – but I didn't convert thought into action. I violated the Noah rule: Predicting rain doesn't count; building arks does. I consequently let Berkshire operate with a dangerous level of risk – at General Re in particular. I'm sorry to say that much risk for which we haven't been compensated remains on our books, but it is running off by the day.

At Berkshire, it should be noted, we have for some years been willing to assume more risk than any other insurer has *knowingly* taken on. That's still the case. We are perfectly willing to lose $2 billion to $2½ billion in a single event (as we did on September 11th) if we have been paid properly for assuming the risk that caused the loss (which on that occasion we weren't).

Indeed, we have a major competitive advantage because of our tolerance for huge losses. Berkshire has massive liquid resources, substantial non-insurance earnings, a favorable tax position and a knowledgeable shareholder constituency willing to accept volatility in earnings. This unique combination enables us to assume risks that far exceed the appetite of even our largest competitors. Over time, insuring these jumbo risks should be profitable, though periodically they will bring on a terrible year.

The bottom-line today is that we will write some coverage for terrorist-related losses, including a few non-correlated policies with very large limits. But we will not knowingly expose Berkshire to losses beyond what we can comfortably handle. We will control our total exposure, no matter what the competition does.

Insurance Operations in 2001

Over the years, our insurance business has provided ever-growing, low-cost funds that have fueled much of Berkshire's growth. Charlie and I believe this will continue to be the case. But we stumbled in a big way in 2001, largely because of underwriting losses at General Re.

In the past I have assured you that General Re was underwriting with discipline – and I have been proven wrong. Though its managers' intentions were good, the company broke each of the three underwriting rules I set forth in the last section and has paid a huge price for doing so. One obvious cause for its failure is that it did not reserve correctly – more about this in the next section – and therefore severely miscalculated the cost of the product it was selling. Not knowing your costs will cause problems in any business. In long-tail reinsurance, where years of unawareness will promote and prolong severe underpricing, ignorance of true costs is dynamite.

Additionally, General Re was overly-competitive in going after, and retaining, business. While all concerned may intend to underwrite with care, it is nonetheless difficult for able, hard-driving professionals to curb their urge to prevail over competitors. If "winning," however, is equated with market share rather than profits, trouble awaits. "No" must be an important part of any underwriter's vocabulary.

At the risk of sounding Pollyannaish, I now assure you that underwriting discipline is being restored at General Re (and its Cologne Re subsidiary) with appropriate urgency. Joe Brandon was appointed General Re's CEO in September and, along with Tad Montross, its new president, is committed to producing underwriting profits. Last fall, Charlie and I read Jack Welch's terrific book, *Jack, Straight from the Gut* (get a copy!). In discussing it, we agreed that Joe has many of Jack's characteristics: He is smart, energetic, hands-on, and expects much of both himself and his organization.

When it was an independent company, General Re often shone, and now it also has the considerable strengths Berkshire brings to the table. With that added advantage and with underwriting discipline restored, General Re should be a huge asset for Berkshire. I predict that Joe and Tad will make it so.

* * * * * * * * * * * *

At the National Indemnity reinsurance operation, Ajit Jain continues to add enormous value to Berkshire. Working with only 18 associates, Ajit manages one of the world's largest reinsurance operations measured by assets, and *the* largest, based upon the size of individual risks assumed.

I have known the details of almost every policy that Ajit has written since he came with us in 1986, and never on even a single occasion have I seen him break any of our three underwriting rules. His extraordinary discipline, of course, does not eliminate losses; it does, however, prevent foolish losses. And that's the key: Just as is the case in investing, insurers produce outstanding long-term results primarily by avoiding dumb decisions, rather than by making brilliant ones.

Since September 11th, Ajit has been particularly busy. Among the policies we have written and retained entirely for our own account are (1) $578 million of property coverage for a South American refinery once a loss there exceeds $1 billion; (2) $1 billion of non-cancelable third-party liability coverage for losses arising from acts of terrorism at several large international airlines; (3) £500 million of property coverage on a large North Sea oil platform, covering losses from terrorism and sabotage, above £600 million that the insured retained or reinsured elsewhere; and (4) significant coverage on the Sears Tower, including losses caused by terrorism, above a $500 million threshold. We have written many other jumbo risks as well, such as protection for the World Cup Soccer Tournament and the 2002 Winter Olympics. In all cases, however, we have attempted to avoid writing groups of policies from which losses might seriously aggregate. We will not, for example, write coverages on a large number of office and apartment towers in a single metropolis without excluding losses from both a nuclear explosion and the fires that would follow it.

No one can match the speed with which Ajit can offer huge policies. After September 11th, his quickness to respond, always important, has become a major competitive advantage. So, too, has our unsurpassed financial strength. Some reinsurers – particularly those who, in turn, are accustomed to laying off much of their business on a second layer of reinsurers known as retrocessionaires – are in a weakened condition and would have difficulty surviving a second mega-cat. When a daisy chain of retrocessionaires exists, a single weak link can pose trouble for all. In assessing the soundness of their reinsurance protection, insurers must therefore apply a stress test to all participants in the chain, and must contemplate a catastrophe loss occurring during a very unfavorable economic environment. After all, you only find out who is swimming naked when the tide goes out. At Berkshire, we retain our risks and depend on no one. And whatever the world's problems, our checks will clear.

Ajit's business will ebb and flow – but his underwriting principles won't waver. It's impossible to overstate his value to Berkshire.

* * * * * * * * * * * *

GEICO, by far our largest primary insurer, made major progress in 2001, thanks to Tony Nicely, its CEO, and his associates. Quite simply, Tony is an owner's dream.

GEICO's premium volume grew 6.6% last year, its float grew $308 million, and it achieved an underwriting profit of $221 million. This means we were actually paid that amount last year to hold the $4.25 billion in float, which of course doesn't belong to Berkshire but can be used by us for investment.

The only disappointment at GEICO in 2001 – and it's an important one – was our inability to add policyholders. Our preferred customers (81% of our total) grew by 1.6% but our standard and non-standard policies fell by 10.1%. Overall, policies in force fell .8%.

New business has improved in recent months. Our closure rate from telephone inquiries has climbed, and our Internet business continues its steady growth. We, therefore, expect at least a modest gain in policy count during 2002. Tony and I are eager to commit much more to marketing than the $219 million we spent last year, but at the moment we cannot see how to do so effectively. In the meantime, our operating costs are low and far below those of our major competitors; our prices are attractive; and our float is cost-free and growing.

* * * * * * * * * * * *

Our other primary insurers delivered their usual fine results last year. These operations, run by Rod Eldred, John Kizer, Tom Nerney, Michael Stearns, Don Towle and Don Wurster had combined premium volume of $579 million, up 40% over 2000. Their float increased 14.5% to $685 million, and they recorded an underwriting profit of $30 million. In aggregate, these companies are one of the finest insurance operations in the country, and their 2002 prospects look excellent.

"Loss Development" and Insurance Accounting

Bad terminology is the enemy of good thinking. When companies or investment professionals use terms such as "EBITDA" and "pro forma," they want you to unthinkingly accept concepts that are dangerously flawed. (In golf, my score is frequently below par on a *pro forma* basis: I have firm plans to "restructure" my putting stroke and therefore only count the swings I take before reaching the green.)

In insurance reporting, "loss development" is a widely used term – and one that is seriously misleading. First, a definition: Loss reserves at an insurer are not funds tucked away for a rainy day, but rather a liability account. If properly calculated, the liability states the amount that an insurer will have to pay for *all* losses (including associated costs) that have occurred prior to the reporting date but have not yet been paid. When calculating the reserve, the insurer will have been notified of many of the losses it is destined to pay, but others will not yet have been reported to it. These losses are called IBNR, for incurred but not reported. Indeed, in some cases (involving, say, product liability or embezzlement) the insured itself will not yet be aware that a loss has occurred.

It's clearly difficult for an insurer to put a figure on the ultimate cost of all such reported and unreported events. But the ability to do so with reasonable accuracy is vital. Otherwise the insurer's managers won't know what its actual loss costs are and how these compare to the premiums being charged. GEICO got into huge trouble in the early 1970s because for several years it severely underreserved, and therefore believed its product (insurance protection) was costing considerably less than was truly the case. Consequently, the company sailed blissfully along, underpricing its product and selling more and more policies at ever-larger losses.

When it becomes evident that reserves at past reporting dates understated the liability that truly existed at the time, companies speak of "loss development." In the year discovered, these shortfalls penalize reported earnings because the "catch-up" costs from prior years must be added to current-year costs when results are calculated. This is what happened at General Re in 2001: a staggering $800 million of loss costs that actually occurred in earlier years, but that were not then recorded, were belatedly recognized last year and charged against current earnings. The mistake was an honest one, I can assure you of that. Nevertheless, for several years, this underreserving caused us to believe that our costs were much lower than they truly were, an error that contributed to woefully inadequate pricing. Additionally, the overstated profit figures led us to pay substantial incentive compensation that we should not have and to incur income taxes far earlier than was necessary.

We recommend scrapping the term "loss development" and its equally ugly twin, "reserve strengthening." (Can you imagine an insurer, upon finding its reserves excessive, describing the reduction that follows as "reserve weakening"?) "Loss development" suggests to investors that some natural, uncontrollable event has occurred in the current year, and "reserve strengthening" implies that adequate amounts have been further buttressed. The truth, however, is that management made an error in estimation that in turn produced an error in the earnings previously reported. The losses didn't "develop" – they were there all along. What developed was management's understanding of the losses (or, in the instances of chicanery, management's willingness to finally fess up).

A more forthright label for the phenomenon at issue would be "loss costs we failed to recognize when they occurred" (or maybe just "oops"). Underreserving, it should be noted, is a common – and serious – problem throughout the property/casualty insurance industry. At Berkshire we told you of our own problems with underestimation in 1984 and 1986. Generally, however, our reserving has been conservative.

Major underreserving is common in cases of companies struggling for survival. In effect, insurance accounting is a self-graded exam, in that the insurer gives some figures to its auditing firm and generally doesn't get an argument. (What the *auditor* gets, however, is a letter from management that is designed to take his firm off the hook if the numbers later look silly.) A company experiencing financial difficulties – of a kind that, if truly faced, could put it out of business – seldom proves to be a tough grader. Who, after all, wants to prepare his own execution papers?

Even when companies have the best of intentions, it's not easy to reserve properly. I've told the story in the past about the fellow traveling abroad whose sister called to tell him that their dad had died. The brother replied that it was impossible for him to get home for the funeral; he volunteered, however, to shoulder its cost. Upon returning, the brother received a bill from the mortuary for $4,500, which he promptly paid. A month later, and a month after that also, he paid $10 pursuant to an add-on invoice. When a third $10 invoice came, he called his sister for an explanation. "Oh," she replied, "I forgot to tell you. We buried dad in a rented suit."

There are a lot of "rented suits" buried in the past operations of insurance companies. Sometimes the problems they signify lie dormant for decades, as was the case with asbestos liability, before virulently manifesting themselves. Difficult as the job may be, it's management's responsibility to adequately account for *all* possibilities. Conservatism is essential. When a claims manager walks into the CEO's office and says "Guess what just happened," his boss, if a veteran, does not expect to hear it's good news. Surprises in the insurance world have been far from symmetrical in their effect on earnings.

Because of this one-sided experience, it is folly to suggest, as some are doing, that all property/casualty insurance reserves be *discounted*, an approach reflecting the fact that they will be paid in the future and that therefore their present value is less than the stated liability for them. Discounting might be acceptable *if* reserves could be precisely established. They can't, however, because a myriad of forces – judicial broadening of policy language and medical inflation, to name just two chronic problems – are constantly working to make reserves inadequate. Discounting would exacerbate this already-serious situation and, additionally, would provide a new tool for the companies that are inclined to fudge.

I'd say that the effects from telling a profit-challenged insurance CEO to lower reserves through discounting would be comparable to those that would ensue if a father told his 16-year-old son to have a normal sex life. Neither party needs that kind of push.

Sources of Reported Earnings

The table that follows shows the main sources of Berkshire's reported earnings. In this presentation, purchase-accounting adjustments (primarily relating to "goodwill") are not assigned to the specific businesses to which they apply, but are instead aggregated and shown separately. This procedure lets you view the earnings of our businesses as they would have been reported had we not purchased them. In recent years, our "expense" for goodwill amortization has been large. Going forward, generally accepted accounting principles ("GAAP") will no longer require amortization of goodwill. This change will increase our reported earnings (though not our true economic earnings) and simplify this section of the report.

Here are some highlights (and lowlights) from 2001 relating to our non-insurance activities:

- Our shoe operations (included in "other businesses") lost $46.2 million pre-tax, with profits at H.H. Brown and Justin swamped by losses at Dexter.

  I've made three decisions relating to Dexter that have hurt you in a major way: (1) buying it in the first place; (2) paying for it with stock and (3) procrastinating when the need for changes in its operations was obvious. I would like to lay these mistakes on Charlie (or anyone else, for that matter) but they were mine. Dexter, prior to our purchase – and indeed for a few years after – prospered despite low-cost foreign competition that was brutal. I concluded that Dexter could continue to cope with that problem, and I was wrong.

  We have now placed the Dexter operation – which is still substantial in size – under the management of Frank Rooney and Jim Issler at H.H. Brown. These men have performed outstandingly for Berkshire, skillfully contending with the extraordinary changes that have bedeviled the footwear industry. During part of 2002, Dexter will be hurt by unprofitable sales commitments it made last year. After that, we believe our shoe business will be reasonably profitable.

- MidAmerican Energy, of which we own 76% on a fully-diluted basis, had a good year in 2001. Its reported earnings should also increase considerably in 2002 given that the company has been shouldering a large charge for the amortization of goodwill and that this "cost" will disappear under the new GAAP rules.

  Last year MidAmerican swapped some properties in England, adding Yorkshire Electric, with its 2.1 million customers. We are now serving 3.6 million customers in the U.K. and are its 2nd largest electric utility. We have an equally important operation in Iowa as well as major generating facilities in California and the Philippines.

  At MidAmerican – this may surprise you – we also own the second-largest residential real estate brokerage business in the country. We are market-share leaders in a number of large cities, primarily in the Midwest, and have recently acquired important firms in Atlanta and Southern California. Last year, operating under various names that are locally familiar, we handled about 106,000 transactions involving properties worth nearly $20 billion. Ron Peltier has built this business for us, and it's likely he will make more acquisitions in 2002 and the years to come.

- Considering the recessionary environment plaguing them, our retailing operations did well in 2001. In jewelry, same-store sales fell 7.6% and pre-tax margins were 8.9% versus 10.7% in 2000. Return on invested capital remains high.

  Same-store sales at our home-furnishings retailers were unchanged and so was the margin – 9.1% pre-tax – these operations earned. Here, too, return on invested capital is excellent.

  We continue to expand in both jewelry and home-furnishings. Of particular note, Nebraska Furniture Mart is constructing a mammoth 450,000 square foot store that will serve the greater Kansas City area beginning in the fall of 2003. Despite Bill Child's counter-successes, we will keep this store open on Sundays.

- The large acquisitions we initiated in late 2000 – Shaw, Johns Manville and Benjamin Moore – all came through their first year with us in great fashion. Charlie and I knew at the time of our purchases that we were in good hands with Bob Shaw, Jerry Henry and Yvan Dupuy, respectively – and we admire their work even more now. Together these businesses earned about $659 million pre-tax.

  Shortly after yearend we exchanged 4,740 Berkshire A shares (or their equivalent in B shares) for the 12.7% minority interest in Shaw, which means we now own 100% of the company. Shaw is our largest non-insurance operation and will play a big part in Berkshire's future.

- All of the income shown for Flight Services in 2001 – and a bit more – came from FlightSafety, our pilot-training subsidiary. Its earnings increased 2.5%, though return on invested capital fell slightly because of the $258 million investment we made last year in simulators and other fixed assets. My 84-year-old friend, Al Ueltschi, continues to run FlightSafety with the same enthusiasm and competitive spirit that he has exhibited since 1951, when he invested $10,000 to start the company. If I line Al up with a bunch of 60-year-olds at the annual meeting, you will not be able to pick him out.

After September 11th, training for commercial airlines fell, and today it remains depressed. However, training for business and general aviation, our main activity, is at near-normal levels and should continue to grow. In 2002, we expect to spend $162 million for 27 simulators, a sum far in excess of our annual depreciation charge of $95 million. Those who believe that EBITDA is in any way equivalent to true earnings are welcome to pick up the tab.

Our NetJets® fractional ownership program sold a record number of planes last year and also showed a gain of 21.9% in service income from management fees and hourly charges. Nevertheless, it operated at a small loss, versus a small profit in 2000. We made a little money in the U.S., but these earnings were more than offset by European losses. Measured by the value of our customers' planes, NetJets accounts for about half of the industry. We believe the other participants, in aggregate, lost significant money.

Maintaining a premier level of safety, security and service was always expensive, and the cost of sticking to those standards was exacerbated by September 11th. No matter how much the cost, we will continue to be the industry leader in all three respects. An uncompromising insistence on delivering only the best to his customers is embedded in the DNA of Rich Santulli, CEO of the company and the inventor of fractional ownership. I'm delighted with his fanaticism on these matters for both the company's sake and my family's: I believe the Buffetts fly more fractional-ownership hours – we log in excess of 800 annually – than does any other family. In case you're wondering, we use exactly the same planes and crews that serve NetJet's other customers.

NetJets experienced a spurt in new orders shortly after September 11th, but its sales pace has since returned to normal. Per-customer usage declined somewhat during the year, probably because of the recession.

Both we and our customers derive significant operational benefits from our being the runaway leader in the fractional ownership business. We have more than 300 planes constantly on the go in the U.S. and can therefore be wherever a customer needs us on very short notice. The ubiquity of our fleet also reduces our "positioning" costs below those incurred by operators with smaller fleets.

These advantages of scale, and others we have, give NetJets a significant economic edge over competition. Under the competitive conditions likely to prevail for a few years, however, our advantage will at best produce modest profits.

- Our finance and financial products line of business now includes XTRA, General Re Securities (which is in a run-off mode that will continue for an extended period) and a few other relatively small operations. The bulk of the assets and liabilities in this segment, however, arise from a few fixed-income strategies, involving highly-liquid AAA securities, that I manage. This activity, which only makes sense when certain market relationships exist, has produced good returns in the past and has reasonable prospects for continuing to do so over the next year or two.

Investments

Below we present our common stock investments. Those that had a market value of more than $500 million at the end of 2001 are itemized.

		12/31/01	
Shares	*Company*	*Cost*	*Market*
		(dollars in millions)	
151,610,700	American Express Company	$ 1,470	$ 5,410
200,000,000	The Coca-Cola Company	1,299	9,430
96,000,000	The Gillette Company	600	3,206
15,999,200	H&R Block, Inc.	255	715
24,000,000	Moody's Corporation	499	957
1,727,765	The Washington Post Company	11	916
53,265,080	Wells Fargo & Company	306	2,315
	Others	4,103	5,726
	Total Common Stocks	$8,543	$28,675

We made few changes in our portfolio during 2001. As a group, our larger holdings have performed poorly in the last few years, some because of disappointing operating results. Charlie and I still like the basic businesses of all the companies we own. But we do not believe Berkshire's equity holdings as a group are undervalued.

Our restrained enthusiasm for these securities is matched by decidedly lukewarm feelings about the prospects for stocks in general over the next decade or so. I expressed my views about equity returns in a speech I gave at an Allen and Company meeting in July (which was a follow-up to a similar presentation I had made two years earlier) and an edited version of my comments appeared in a December 10th *Fortune* article. I'm enclosing a copy of that article. You can also view the *Fortune* version of my 1999 talk at our website www.berkshirehathaway.com.

Charlie and I believe that American business will do fine over time but think that today's equity prices presage only moderate returns for investors. The market outperformed business for a very long period, and that phenomenon had to end. A market that no more than parallels business progress, however, is likely to leave many investors disappointed, particularly those relatively new to the game.

Here's one for those who enjoy an odd coincidence: The Great Bubble ended on March 10, 2000 (though we didn't realize that fact until some months later). On that day, the NASDAQ (recently 1,731) hit its all-time high of 5,132. That same day, Berkshire shares traded at $40,800, their lowest price since mid-1997.

* * * * * * * * * * * *

During 2001, we were somewhat more active than usual in "junk" bonds. These are not, we should emphasize, suitable investments for the general public, because too often these securities live up to their name. We have *never* purchased a newly-issued junk bond, which is the only kind most investors are urged to buy. When losses occur in this field, furthermore, they are often disastrous: Many issues end up at a small fraction of their original offering price and some become entirely worthless.

Despite these dangers, we periodically find a few – a *very* few – junk securities that are interesting to us. And, so far, our 50-year experience in distressed debt has proven rewarding. In our 1984 annual report, we described our purchases of Washington Public Power System bonds when that issuer fell into disrepute. We've also, over the years, stepped into other apparent calamities such as Chrysler Financial, Texaco and RJR Nabisco – all of which returned to grace. Still, if we stay active in junk bonds, you can expect us to have losses from time to time.

Occasionally, a purchase of distressed bonds leads us into something bigger. Early in the Fruit of the Loom bankruptcy, we purchased the company's public and bank debt at about 50% of face value. This was an unusual bankruptcy in that interest payments on senior debt were continued without interruption, which meant we earned about a 15% current return. Our holdings grew to 10% of Fruit's senior debt, which will probably end up returning us about 70% of face value. Through this investment, we indirectly reduced our purchase price for the whole company by a small amount.

In late 2000, we began purchasing the obligations of FINOVA Group, a troubled finance company, and that, too, led to our making a major transaction. FINOVA then had about $11 billion of debt outstanding, of which we purchased 13% at about two-thirds of face value. We expected the company to go into bankruptcy, but believed that liquidation of its assets would produce a payoff for creditors that would be well above our cost. As default loomed in early 2001, we joined forces with Leucadia National Corporation to present the company with a prepackaged plan for bankruptcy.

The plan as subsequently modified (and I'm simplifying here) provided that creditors would be paid 70% of face value (along with full interest) and that they would receive a newly-issued 7½% note for the 30% of their claims not satisfied by cash. To fund FINOVA's 70% distribution, Leucadia and Berkshire formed a jointly-owned entity – mellifluently christened Berkadia – that borrowed $5.6 billion through FleetBoston and, in turn, re-lent this sum to FINOVA, concurrently obtaining a priority claim on its assets. Berkshire guaranteed 90% of the Berkadia borrowing and also has a secondary guarantee on the 10% for which Leucadia has primary responsibility. (Did I mention that I am simplifying?).

There is a spread of about two percentage points between what Berkadia pays on its borrowing and what it receives from FINOVA, with this spread flowing 90% to Berkshire and 10% to Leucadia. As I write this, each loan has been paid down to $3.9 billion.

As part of the bankruptcy plan, which was approved on August 10, 2001, Berkshire also agreed to offer 70% of face value for up to $500 million principal amount of the $3.25 billion of new 7½% bonds that were issued by FINOVA. (Of these, we had already received $426.8 million in principal amount because of our 13% ownership of the original debt.) Our offer, which was to run until September 26, 2001, could be withdrawn under a variety of conditions, one of which became operative if the New York Stock Exchange closed during the offering period. When that indeed occurred in the week of September 11th, we promptly terminated the offer.

Many of FINOVA's loans involve aircraft assets whose values were significantly diminished by the events of September 11th. Other receivables held by the company also were imperiled by the economic consequences of the attack that day. FINOVA's prospects, therefore, are not as good as when we made our proposal to the bankruptcy court. Nevertheless we feel that overall the transaction will prove satisfactory for Berkshire. Leucadia has day-to-day operating responsibility for FINOVA, and we have long been impressed with the business acumen and managerial talent of its key executives.

* * * * * * * * * * * *

It's déjà vu time again: In early 1965, when the investment partnership I ran took control of Berkshire, that company had its main banking relationships with First National Bank of Boston and a large New York City bank. Previously, I had done no business with either.

Fast forward to 1969, when I wanted Berkshire to buy the Illinois National Bank and Trust of Rockford. We needed $10 million, and I contacted both banks. There was no response from New York. However, two representatives of the Boston bank immediately came to Omaha. They told me they would supply the money for our purchase and that we would work out the details later.

For the next three decades, we borrowed almost nothing from banks. (Debt is a four-letter word around Berkshire.) Then, in February, when we were structuring the FINOVA transaction, I again called Boston, where First National had morphed into FleetBoston. Chad Gifford, the company's president, responded just as Bill Brown and Ira Stepanian had back in 1969 – "you've got the money and we'll work out the details later."

And that's just what happened. FleetBoston syndicated a loan for $6 billion (as it turned out, we didn't need $400 million of it), and it was quickly oversubscribed by 17 banks throughout the world. Sooooo . . . if you ever need $6 billion, just give Chad a call – assuming, that is, your credit is AAA.

* * * * * * * * * * * *

One more point about our investments: The media often report that "Buffett is buying" this or that security, having picked up the "fact" from reports that Berkshire files. These accounts are sometimes correct, but at other times the transactions Berkshire reports are actually being made by Lou Simpson, who runs a $2 billion portfolio for GEICO that is quite independent of me. Normally, Lou does not tell me what he is buying or selling, and I learn of his activities only when I look at a GEICO portfolio summary that I receive a few days after the end of each month. Lou's thinking, of course, is quite similar to mine, but we usually end up in different securities. That's largely because he's working with less money and can therefore invest in smaller companies than I. Oh, yes, there's also another minor difference between us: In recent years, Lou's performance has been far better than mine.

Charitable Contributions

Berkshire follows a highly unusual policy in respect to charitable contributions – but it's one that Charlie and I believe is both rational and fair to owners.

First, we let our operating subsidiaries make their own charitable decisions, requesting only that the owners/managers who once ran these as independent companies make all donations to their *personal* charities from their own funds, instead of using company money. When our managers are using company funds, we trust them to make gifts in a manner that delivers commensurate tangible or intangible benefits to the operations they manage. Last year contributions from Berkshire subsidiaries totaled $19.2 million.

At the parent company level, we make no contributions except those designated by shareholders. We do not match contributions made by directors or employees, nor do we give to the favorite charities of the Buffetts or the Mungers. However, prior to our purchasing them, a few of our subsidiaries had employee-match programs and we feel fine about their continuing them: It's not our style to tamper with successful business cultures.

To implement our *owners'* charitable desires, each year we notify registered holders of A shares (A's represent 86.6% of our equity capital) of a per-share amount that they can instruct us to contribute to as many as three charities. Shareholders name the charity; Berkshire writes the check. Any organization that qualifies under the Internal Revenue Code can be designated by shareholders. Last year Berkshire made contributions of $16.7 million at the direction of 5,700 shareholders, who named 3,550 charities as recipients. Since we started this program, our shareholders' gifts have totaled $181 million.

Most public corporations eschew gifts to religious institutions. These, however, are favorite charities of our shareholders, who last year named 437 churches and synagogues to receive gifts. Additionally, 790 schools were recipients. A few of our larger shareholders, including Charlie and me, designate their personal foundations to get gifts, so that those entities can, in turn, disburse their funds widely.

I get a few letters every week criticizing Berkshire for contributing to Planned Parenthood. These letters are usually prompted by an organization that wishes to see boycotts of Berkshire products. The letters are invariably polite and sincere, but their writers are unaware of a key point: It's not Berkshire, but rather its owners who are making charitable decisions – and these owners are about as diverse in their opinions as you can imagine. For example, they are probably on both sides of the abortion issue in roughly the same proportion as the American population. We'll follow their instructions, whether they designate Planned Parenthood or Metro Right to Life, just as long as the charity possesses 501(c)(3) status. It's as if we paid a dividend, which the shareholder then donated. Our form of disbursement, however, is more tax-efficient.

In neither the purchase of goods nor the hiring of personnel, do we ever consider the religious views, the gender, the race or the sexual orientation of the persons we are dealing with. It would not only be wrong to do so, it would be idiotic. We need all of the talent we can find, and we have learned that able and trustworthy managers, employees and suppliers come from a very wide spectrum of humanity.

* * * * * * * * * * *

To participate in our future charitable contribution programs, you must own Class A shares that are registered in the name of the actual owner, not the nominee name of a broker, bank or depository. Shares not so registered on August 31, 2002 will be ineligible for the 2002 program. When you get the contributions form from us, return it promptly. Designations received after the due date will not be honored.

The Annual Meeting

This year's annual meeting will be on Saturday, May 4, and we will again be at the Civic Auditorium. The doors will open at 7 a.m., the movie will begin at 8:30, and the meeting itself will commence at 9:30. There will be a short break at noon for food. (Sandwiches can be bought at the Civic's concession stands.) Except for that interlude, Charlie and I will answer questions until 3:30. Give us your best shot.

For at least the next year, the Civic, located downtown, is the only site available to us. We must therefore hold the meeting on either Saturday or Sunday to avoid the traffic and parking nightmare sure to occur on a weekday. Shortly, however, Omaha will have a new Convention Center with plenty of parking facilities. Assuming that we then head for the Center, I will poll shareholders to see whether you wish to return to the Monday meeting that was standard until 2000. We will decide that vote based on a count of shareholders, not shares. (This is *not* a system, however, we will ever institute to decide who should be CEO.)

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. They do a terrific job for us each year, and I thank them for it.

In our usual fashion, we will run buses from the larger hotels to the meeting. Afterwards, the buses will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

We have added so many new companies to Berkshire this year that I'm not going to detail all of the products that we will be *selling* at the meeting. But come prepared to carry home everything from bricks to candy. And underwear, of course. Assuming our Fruit of the Loom purchase has closed by May 4, we will be selling Fruit's latest styles, which will make you your neighborhood's fashion leader. Buy a lifetime supply.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 41 of the 49 jurisdictions in which we operate. Bring the details of your existing insurance and check out whether we can save you money.

At the Omaha airport on Saturday, we will have the usual array of aircraft from NetJets® available for your inspection. Just ask a representative at the Civic about viewing any of these planes. If you buy what we consider an appropriate number of items during the weekend, you may well need your own plane to take them home. And, if you buy a fraction of a plane, we might even throw in a three-pack of briefs or boxers.

At Nebraska Furniture Mart, located on a 75-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing, which means we will be offering our shareholders a discount that is customarily given only to employees. We initiated this special pricing at NFM five years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $11.5 million in 2001.

To get the discount, you must make your purchases on Thursday, May 2 through Monday, May 6 and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. on weekdays and 10 a.m. to 6 p.m. on Saturdays and Sundays.

Borsheim's — the largest jewelry store in the country except for Tiffany's Manhattan store — will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, May 3. The second, the main gala, will be from 9 a.m. to 5 p.m. on Sunday, May 5. Shareholder prices will be available Thursday through Monday, so if you wish to avoid the large crowds that will assemble on Friday evening and Sunday, come at other times and identify yourself as a shareholder. On Saturday, we will be open until 6 p.m. Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, so the more you buy, the more you save (or at least that's what my wife and daughter tell me). Come by and let us perform a walletectomy on you.

In the mall outside of Borsheim's, we will have some of the world's top bridge experts available to play with our shareholders on Sunday afternoon. We expect Bob and Petra Hamman along with Sharon Osberg to host tables. Patrick Wolff, twice U.S. chess champion, will also be in the mall, taking on all comers — blindfolded!

Last year, Patrick played as many as six games simultaneously — with his blindfold securely in place — and this year will try for seven. Finally, Bill Robertie, one of only two players who have twice won the backgammon world championship, will be on hand to test your skill at that game. Come to the mall on Sunday for the Mensa Olympics.

Gorat's — my favorite steakhouse — will again be open exclusively for Berkshire shareholders on Sunday, May 5, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on Sunday, you must have a reservation. To make one, call 402-551-3733 on April 1 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. Show your sophistication by ordering a rare T-bone with a double order of hash browns.

The usual baseball game will be held at Rosenblatt Stadium at 7 p.m. on Saturday night. This year the Omaha Royals will play the Oklahoma RedHawks. Last year, in an attempt to emulate the career switch of Babe Ruth, I gave up pitching and tried batting. Bob Gibson, an Omaha native, was on the mound and I was terrified, fearing Bob's famous brush-back pitch. Instead, he delivered a fast ball in the strike zone, and with a Mark McGwire-like swing, I managed to connect for a hard grounder, which inexplicably died in the infield. I didn't run it out: At my age, I get winded playing a hand of bridge.

I'm not sure what will take place at the ballpark this year, but come out and be surprised. Our proxy statement contains instructions for obtaining tickets to the game. Those people ordering tickets to the annual meeting will receive a booklet containing all manner of information that should help you enjoy your visit in Omaha. There will be plenty of action in town. So come for Woodstock Weekend and join our Celebration of Capitalism at the Civic.

* * * * * * * * * * * *

Finally, I would like to thank the wonderful and incredibly productive crew at World Headquarters (all 5,246.5 square feet of it) who make my job so easy. Berkshire added about 40,000 employees last year, bringing our workforce to 110,000. At headquarters we added one employee and now have 14.8. (I've tried in vain to get JoEllen Rieck to change her workweek from four days to five; I think she likes the national recognition she gains by being .8.)

The smooth handling of the array of duties that come with our current size and scope – as well as some additional activities almost unique to Berkshire, such as our shareholder gala and designated-gifts program – takes a very special group of people. And that we most definitely have.

Warren E. Buffett
February 28, 2002 Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
2001	(6.2)	(11.9)	5.7
2002	10.0	(22.1)	32.1
Average Annual Gain – 1965-2002	22.2	10.0	12.2
Overall Gain – 1964-2002	214,433	3,663	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2002 was $6.1 billion, which increased the per-share book value of both our Class A and Class B stock by 10.0%. Over the last 38 years (that is, since present management took over) per-share book value has grown from $19 to $41,727, a rate of 22.2% compounded annually.*

In all respects 2002 was a banner year. I'll provide details later, but here's a summary:

- Our various non-insurance operations performed exceptionally well, despite a sluggish economy. A decade ago Berkshire's annual pre-tax earnings from our non-insurance businesses was $272 million. Now, from our ever-expanding collection of manufacturing, retailing, service and finance businesses, we earn that sum *monthly*.

- Our insurance group increased its float to $41.2 billion, a hefty gain of $5.7 billion. Better yet, the use of these funds in 2002 cost us only 1%. Getting back to low-cost float feels good, particularly after our poor results during the three previous years. Berkshire's reinsurance division and GEICO shot the lights out in 2002, and underwriting discipline was restored at General Re.

- Berkshire acquired some important new businesses – with economic characteristics ranging from good to great, run by managers ranging from great to great. Those attributes are two legs of our "entrance" strategy, the third being a sensible purchase price. Unlike LBO operators and private equity firms, we have no "exit" strategy – we buy to keep. That's one reason why Berkshire is usually the first – and sometimes the only – choice for sellers and their managers.

- Our marketable securities outperformed most indices. For Lou Simpson, who manages equities at GEICO, this was old stuff. But, for me, it was a welcome change from the last few years, during which my investment record was dismal.

The confluence of these favorable factors in 2002 caused our book-value gain to outstrip the performance of the S&P 500 by 32.1 percentage points. This result is aberrational: Charlie Munger, Berkshire's vice chairman and my partner, and I hope to achieve – *at most* – an average annual advantage of a few points. In the future, there will be years in which the S&P soundly trounces us. That will in fact almost certainly happen during a strong bull market, because the portion of our assets committed to common stocks has significantly declined. This change, of course, helps our relative performance in down markets such as we had in 2002.

I have another caveat to mention about last year's results. If you've been a reader of financial reports in recent years, you've seen a flood of "pro-forma" earnings statements – tabulations in which managers invariably show "earnings" far in excess of those allowed by their auditors. In these presentations, the CEO tells his owners "don't count this, don't count that – just count what makes earnings fat." Often, a forget-all-this-bad-stuff message is delivered year after year without management so much as blushing.

*All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

We've yet to see a pro-forma presentation disclosing that audited earnings were somewhat high. So let's make a little history: Last year, on a pro-forma basis, Berkshire had *lower* earnings than those we actually reported.

That is true because two favorable factors aided our reported figures. First, in 2002 there was no megacatastrophe, which means that Berkshire (and other insurers as well) earned more from insurance than if losses had been normal. In years when the reverse is true – because of a blockbuster hurricane, earthquake or man-made disaster – many insurers like to report that they would have earned X "except for" the unusual event. The implication is that since such megacats are infrequent, they shouldn't be counted when "true" earnings are calculated. That is deceptive nonsense. "Except for" losses will forever be part of the insurance business, and they will forever be paid with shareholders' money.

Nonetheless, for the purposes of this exercise, we'll take a page from the industry's book. For last year, when we didn't have any truly major disasters, a downward adjustment is appropriate if you wish to "normalize" our underwriting result.

Secondly, the bond market in 2002 favored certain strategies we employed in our finance and financial products business. Gains from those strategies will certainly diminish within a year or two – and may well disappear.

Soooo . . . "except for" a couple of favorable breaks, our pre-tax earnings last year would have been about $500 million less than we actually reported. We're happy, nevertheless, to bank the excess. As Jack Benny once said upon receiving an award: "I don't deserve this honor – but, then, I have arthritis, and I don't deserve that either."

* * * * * * * * * * * *

We continue to be blessed with an extraordinary group of managers, many of whom haven't the slightest financial need to work. They stick around, though: In 38 years, we've never had a single CEO of a subsidiary elect to leave Berkshire to work elsewhere. Counting Charlie, we now have six managers over 75, and I hope that in four years that number increases by at least two (Bob Shaw and I are both 72). Our rationale: "It's hard to teach a new dog old tricks."

Berkshire's operating CEOs are masters of their crafts and run their businesses as if they were their own. My job is to stay out of their way and allocate whatever excess capital their businesses generate. It's easy work.

My managerial model is Eddie Bennett, who was a batboy. In 1919, at age 19, Eddie began his work with the Chicago White Sox, who that year went to the World Series. The next year, Eddie switched to the Brooklyn Dodgers, and they, too, won their league title. Our hero, however, smelled trouble. Changing boroughs, he joined the Yankees in 1921, and they promptly won their first pennant in history. Now Eddie settled in, shrewdly seeing what was coming. In the next seven years, the Yankees won five American League titles.

What does this have to do with management? It's simple – to be a winner, work with winners. In 1927, for example, Eddie received $700 for the 1/8th World Series share voted him by the legendary Yankee team of Ruth and Gehrig. This sum, which Eddie earned by working only four days (because New York swept the Series) was roughly equal to the full-year pay then earned by batboys who worked with ordinary associates.

Eddie understood that how he lugged bats was unimportant; what counted instead was hooking up with the cream of those on the playing field. I've learned from Eddie. At Berkshire, I regularly hand bats to many of the heaviest hitters in American business.

Acquisitions

We added some sluggers to our lineup last year. Two acquisitions pending at yearend 2001 were completed: Albecca (which operates under the name Larson-Juhl), the U.S. leader in custom-made picture frames; and Fruit of the Loom, the producer of about 33.3% of the men's and boy's underwear sold in the U.S. and of other apparel as well.

Both companies came with outstanding CEOs: Steve McKenzie at Albecca and John Holland at Fruit. John, who had retired from Fruit in 1996, rejoined it three years ago and rescued the company from the disastrous path it had gone down after he'd left. He's now 70, and I am trying to convince him to make his next retirement coincident with mine (presently scheduled for five years after my death – a date subject, however, to extension).

We initiated and completed two other acquisitions last year that were somewhat below our normal size threshold. In aggregate, however, these businesses earn more than $60 million pre-tax annually. Both operate in industries characterized by tough economics, but both also have important competitive strengths that enable them to earn decent returns on capital.

The newcomers are:

(a) CTB, a worldwide leader in equipment for the poultry, hog, egg production and grain industries; and

(b) Garan, a manufacturer of children's apparel, whose largest and best-known line is Garanimals®.

These two companies came with the managers responsible for their impressive records: Vic Mancinelli at CTB and Seymour Lichtenstein at Garan.

The largest acquisition we initiated in 2002 was The Pampered Chef, a company with a fascinating history dating back to 1980. Doris Christopher was then a 34-year-old suburban Chicago home economics teacher with a husband, two little girls, and absolutely no business background. Wanting, however, to supplement her family's modest income, she turned to thinking about what she knew best – food preparation. Why not, she wondered, make a business out of marketing kitchenware, focusing on the items she herself had found most useful?

To get started, Doris borrowed $3,000 against her life insurance policy – all the money *ever* injected into the company – and went to the Merchandise Mart on a buying expedition. There, she picked up a dozen each of this and that, and then went home to set up operations in her basement.

Her plan was to conduct in-home presentations to small groups of women, gathered at the homes of their friends. While driving to her first presentation, though, Doris almost talked herself into returning home, convinced she was doomed to fail.

But the women she faced that evening loved her and her products, purchased $175 of goods, and TPC was underway. Working with her husband, Jay, Doris did $50,000 of business in the first year. Today – only 22 years later – TPC does more than $700 million of business annually, working through 67,000 kitchen consultants.

I've been to a TPC party, and it's easy to see why the business is a success. The company's products, in large part proprietary, are well-styled and highly useful, and the consultants are knowledgeable and enthusiastic. Everyone has a good time. Hurry to pamperedchef.com on the Internet to find where to attend a party near you.

Two years ago, Doris brought in Sheila O'Connell Cooper, now CEO, to share the management load, and in August they met with me in Omaha. It took me about ten seconds to decide that these were two managers with whom I wished to partner, and we promptly made a deal. Berkshire shareholders couldn't be luckier than to be associated with Doris and Sheila.

* * * * * * * * * * * *

Berkshire also made some important acquisitions last year through MidAmerican Energy Holdings (MEHC), a company in which our equity interest is 80.2%. Because the Public Utility Holding Company Act (PUHCA) limits us to 9.9% voting control, however, we are unable to fully consolidate MEHC's financial statements.

Despite the voting-control limitation – and the somewhat strange capital structure at MEHC it has engendered – the company is a key part of Berkshire. Already it has $18 billion of assets and delivers our largest stream of non-insurance earnings. It could well grow to be huge.

Last year MEHC acquired two important gas pipelines. The first, Kern River, extends from Southwest Wyoming to Southern California. This line moves about 900 million cubic feet of gas a day and is undergoing a $1.2 billion expansion that will double throughput by this fall. At that point, the line will carry enough gas to generate electricity for ten million homes.

The second acquisition, Northern Natural Gas, is a 16,600 mile line extending from the Southwest to a wide range of Midwestern locations. This purchase completes a corporate odyssey of particular interest to Omahans.

From its beginnings in the 1930s, Northern Natural was one of Omaha's premier businesses, run by CEOs who regularly distinguished themselves as community leaders. Then, in July, 1985, the company – which in 1980 had been renamed InterNorth – merged with Houston Natural Gas, a business less than half its size. The companies announced that the enlarged operation would be headquartered in Omaha, with InterNorth's CEO continuing in that job.

Within a year, those promises were broken. By then, the former CEO of Houston Natural had taken over the top job at InterNorth, the company had been renamed, and the headquarters had been moved to Houston. These switches were orchestrated by the new CEO – Ken Lay – and the name he chose was Enron.

Fast forward 15 years to late 2001. Enron ran into the troubles we've heard so much about and borrowed money from Dynegy, putting up the Northern Natural pipeline operation as collateral. The two companies quickly had a falling out, and the pipeline's ownership moved to Dynegy. That company, in turn, soon encountered severe financial problems of its own.

MEHC received a call on Friday, July 26, from Dynegy, which was looking for a quick and certain cash sale of the pipeline. Dynegy phoned the right party: On July 29, we signed a contract, and shortly thereafter Northern Natural returned home.

When 2001 began, Charlie and I had no idea that Berkshire would be moving into the pipeline business. But upon completion of the Kern River expansion, MEHC will transport about 8% of all gas used in the U.S. We continue to look for large energy-related assets, though in the electric utility field PUHCA constrains what we can do.

* * * * * * * * * * * *

A few years ago, and somewhat by accident, MEHC found itself in the residential real estate brokerage business. It is no accident, however, that we have dramatically expanded the operation. Moreover, we are likely to keep on expanding in the future.

We call this business HomeServices of America. In the various communities it serves, though, it operates under the names of the businesses it has acquired, such as CBS in Omaha, Edina Realty in Minneapolis and Iowa Realty in Des Moines. In most metropolitan areas in which we operate, we are the clear market leader.

HomeServices is now the second largest residential brokerage business in the country. On one side or the other (or both), we participated in $37 billion of transactions last year, up 100% from 2001.

Most of our growth came from three acquisitions we made during 2002, the largest of which was Prudential California Realty. Last year, this company, the leading realtor in a territory consisting of Los Angeles, Orange and San Diego Counties, participated in $16 billion of closings.

In a very short period, Ron Peltier, the company's CEO, has increased HomeServices' revenues – and profits – dramatically. Though this business will always be cyclical, it's one we like and in which we continue to have an appetite for sensible acquisitions.

* * * * * * * * * * * *

Dave Sokol, MEHC's CEO, and Greg Abel, his key associate, are huge assets for Berkshire. They are dealmakers, and they are managers. Berkshire stands ready to inject massive amounts of money into MEHC – and it will be fun to watch how far Dave and Greg can take the business.

The Economics of Property/Casualty Insurance

Our core business — though we have others of great importance — is insurance. To understand Berkshire, therefore, it is necessary that you understand how to evaluate an insurance company. The key determinants are: (1) the amount of float that the business generates; (2) its cost; and (3) most critical of all, the long-term outlook for both of these factors.

To begin with, float is money we hold but don't own. In an insurance operation, float arises because premiums are received before losses are paid, an interval that sometimes extends over many years. During that time, the insurer invests the money. This pleasant activity typically carries with it a downside: The premiums that an insurer takes in usually do not cover the losses and expenses it eventually must pay. That leaves it running an "underwriting loss," which is the cost of float. An insurance business has value if its cost of float over time is less than the cost the company would otherwise incur to obtain funds. But the business is a lemon if its cost of float is higher than market rates for money. Moreover, the downward trend of interest rates in recent years has transformed underwriting losses that formerly were tolerable into burdens that move insurance businesses deeply into the lemon category.

Historically, Berkshire has obtained its float at a very low cost. Indeed, our cost has been less than zero in many years; that is, we've actually been paid for holding other people's money. In 2001, however, our cost was terrible, coming in at 12.8%, about half of which was attributable to World Trade Center losses. Back in 1983-84, we had years that were even worse. There's nothing automatic about cheap float.

The table that follows shows (at intervals) the float generated by the various segments of Berkshire's insurance operations since we entered the business 36 years ago upon acquiring National Indemnity Company (whose traditional lines are included in the segment "Other Primary"). For the table we have calculated our float — which we generate in large amounts relative to our premium volume — by adding net loss reserves, loss adjustment reserves, funds held under reinsurance assumed and unearned premium reserves, and then subtracting insurance-related receivables, prepaid acquisition costs, prepaid taxes and deferred charges applicable to assumed reinsurance. (Got that?)

Yearend Float (in $ millions)

Year	GEICO	General Re	Other Reinsurance	Other Primary	Total
1967				20	20
1977			40	131	171
1987			701	807	1,508
1997	2,917		4,014	455	7,386
1998	3,125	14,909	4,305	415	22,754
1999	3,444	15,166	6,285	403	25,298
2000	3,943	15,525	7,805	598	27,871
2001	4,251	19,310	11,262	685	35,508
2002	4,678	22,207	13,396	943	41,224

Last year our cost of float was 1%. As I mentioned earlier, you should temper your enthusiasm about this favorable result given that no megacatastrophe occurred in 2002. We're certain to get one of these disasters periodically, and when we do our float-cost will spike.

Our 2002 results were hurt by 1) a painful charge at General Re for losses that should have been recorded as costs in earlier years, and 2) a "desirable" charge we incur annually for retroactive insurance (see the next section for more about these items). These costs totaled $1.75 billion, or about 4.6% of float. Fortunately, our overall underwriting experience on 2002 business was excellent, which allowed us, even after the charges noted, to approach a no-cost result.

Absent a megacatastrophe, I expect our cost of float in 2003 to again be very low – perhaps even less than zero. In the rundown of our insurance operations that follows, you will see why I'm optimistic that, over time, our underwriting results will both surpass those achieved by the industry and deliver us investable funds at minimal cost.

Insurance Operations

If our insurance operations are to generate low-cost float over time, they must: (a) underwrite with unwavering discipline; (b) reserve conservatively; and (c) avoid an aggregation of exposures that would allow a supposedly "impossible" incident to threaten their solvency. All of our major insurance businesses, with one exception, have regularly met those tests.

The exception is General Re, and there was much to do at that company last year to get it up to snuff. I'm delighted to report that under Joe Brandon's leadership, and with yeoman assistance by Tad Montross, enormous progress has been made on each of the fronts described.

When I agreed in 1998 to merge Berkshire with Gen Re, I thought that company stuck to the three rules I've enumerated. I had studied the operation for decades and had observed underwriting discipline that was consistent and reserving that was conservative. At merger time, I detected no slippage in Gen Re's standards.

I was dead wrong. Gen Re's culture and practices had substantially changed and unbeknownst to management – and to me – the company was grossly mispricing its current business. In addition, Gen Re had accumulated an aggregation of risks that would have been fatal had, say, terrorists detonated several large-scale nuclear bombs in an attack on the U.S. A disaster of that scope was highly improbable, of course, but it is up to insurers to limit their risks in a manner that leaves their finances rock-solid if the "impossible" happens. Indeed, had Gen Re remained independent, the World Trade Center attack alone would have threatened the company's existence.

When the WTC disaster occurred, it exposed weaknesses in Gen Re's operations that I should have detected earlier. But I was lucky: Joe and Tad were on hand, freshly endowed with increased authority and eager to rapidly correct the errors of the past. They knew what to do – and they did it.

It takes time for insurance policies to run off, however, and 2002 was well along before we managed to reduce our aggregation of nuclear, chemical and biological risk (NCB) to a tolerable level. That problem is now behind us.

On another front, Gen Re's underwriting attitude has been dramatically altered: The entire organization now understands that we wish to write only properly-priced business, whatever the effect on volume. Joe and Tad judge themselves *only* by Gen Re's underwriting profitability. Size simply doesn't count.

Finally, we are making every effort to get our reserving right. If we fail at that, we can't know our true costs. And any insurer that has no idea what its costs are is heading for big trouble.

At yearend 2001, General Re attempted to reserve adequately for all losses that had occurred prior to that date and were not yet paid – but we failed badly. Therefore the company's 2002 underwriting results were penalized by an additional $1.31 billion that we recorded to correct the estimation mistakes of earlier years. When I review the reserving errors that have been uncovered at General Re, a line from a country song seems apt: "I wish I didn't know now what I didn't know then."

I can promise you that our top priority going forward is to avoid inadequate reserving. But I can't guarantee success. The natural tendency of most casualty-insurance managers is to underreserve, and they must have a particular mindset – which, it may surprise you, has nothing to do with actuarial expertise – if they are to overcome this devastating bias. Additionally, a reinsurer faces far more difficulties in reserving properly than does a primary insurer. Nevertheless, at Berkshire, we have generally been successful in our reserving, and we are determined to be at General Re as well.

In summary, I believe General Re is now well positioned to deliver huge amounts of no-cost float to Berkshire and that its sink-the-ship catastrophe risk has been eliminated. The company still possesses the important competitive strengths that I've outlined in the past. And it gained another highly significant advantage last year when each of its three largest worldwide competitors, previously rated AAA, was demoted by at least one rating agency. Among the giants, General Re, rated AAA across-the-board, is now in a class by itself in respect to financial strength.

No attribute is more important. Recently, in contrast, one of the world's largest reinsurers – a company regularly recommended to primary insurers by leading brokers – has all but ceased paying claims, including those both valid and due. This company owes many billions of dollars to hundreds of primary insurers who now face massive write-offs. "Cheap" reinsurance is a fool's bargain: When an insurer lays out money today in exchange for a reinsurer's promise to pay a decade or two later, it's dangerous – and possibly life-threatening – for the insurer to deal with any but the strongest reinsurer around.

Berkshire shareholders owe Joe and Tad a huge thank you for their accomplishments in 2002. They worked harder during the year than I would wish for anyone – and it is paying off.

At GEICO, everything went so well in 2002 that we should pinch ourselves. Growth was substantial, profits were outstanding, policyholder retention was up and sales productivity jumped significantly. These trends continue in early 2003.

Thank Tony Nicely for all of this. As anyone who knows him will attest, Tony has been in love with GEICO for 41 years – ever since he went to work for the company at 18 – and his results reflect this passion. He is proud of the money we save policyholders – about $1 billion annually versus what other insurers, on average, would have charged them. He is proud of the service we provide these policyholders: In a key industry survey, GEICO was recently ranked above all major competitors. He is proud of his 19,162 associates, who last year were awarded profit-sharing payments equal to 19% of their base salary because of the splendid results they achieved. And he is proud of the growing profits he delivers to Berkshire shareholders.

GEICO took in $2.9 billion in premiums when Berkshire acquired full ownership in 1996. Last year, its volume was $6.9 billion, with plenty of growth to come. Particularly promising is the company's Internet operation, whose new business grew by 75% last year. Check us out at GEICO.com (or call 800-847-7536). In most states, shareholders get a special 8% discount.

Here's one footnote to GEICO's 2002 earnings that underscores the need for insurers to do business with only the strongest of reinsurers. In 1981-1983, the managers then running GEICO decided to try their hand at writing commercial umbrella and product liability insurance. The risks seemed modest: the company took in only $3,051,000 from this line and used almost all of it – $2,979,000 – to buy reinsurance in order to limit its losses. GEICO was left with a paltry $72,000 as compensation for the minor portion of the risk that it retained. But this small bite of the apple was more than enough to make the experience memorable. GEICO's losses from this venture now total a breathtaking $94.1 *million* or about 130,000% of the net premium it received. Of the total loss, uncollectable receivables from deadbeat reinsurers account for no less than $90.3 million (including $19 million charged in 2002). So much for "cheap" reinsurance.

* * * * * * * * * * * *

Ajit Jain's reinsurance division was the major reason our float cost us so little last year. If we ever put a photo in a Berkshire annual report, it will be of Ajit. In color!

Ajit's operation has amassed $13.4 billion of float, more than all but a handful of insurers have ever built up. He accomplished this from a standing start in 1986, and even now has a workforce numbering only 20. And, most important, he has produced underwriting profits.

His profits are particularly remarkable if you factor in some accounting arcana that I am about to lay on you. So prepare to eat your spinach (or, alternatively, if debits and credits aren't your thing, skip the next two paragraphs).

Ajit's 2002 underwriting profit of $534 million came *after* his operation recognized a charge of $428 million attributable to "retroactive" insurance he has written over the years. In this line of business, we assume from another insurer the obligation to pay up to a specified amount for losses they have already incurred – often for events that took place decades earlier – but that are yet to be paid (for example, because a worker hurt in 1980 will receive monthly payments for life). In these arrangements, an insurer pays us a large upfront premium, but one that is less than the losses we expect to pay. We willingly accept this differential because a) our payments are capped, and b) we get to use the money until loss payments are actually made, with these often stretching out over a decade or more. About 80% of the $6.6 billion in asbestos and environmental loss reserves that we carry arises from capped contracts, whose costs consequently can't skyrocket.

When we write a retroactive policy, we immediately record both the premium and a reserve for the expected losses. The difference between the two is entered as an asset entitled "deferred charges – reinsurance assumed." This is no small item: at yearend, for all retroactive policies, it was $3.4 billion. We then amortize this asset downward by charges to income over the expected life of each policy. These charges – $440 million in 2002, including charges at Gen Re – create an underwriting loss, but one that is intentional and desirable. And even after this drag on reported results, Ajit achieved a large underwriting gain last year.

We want to emphasize, however, that we assume risks in Ajit's operation that are huge – *far* larger than those retained by any other insurer in the world. Therefore, a single event could cause a major swing in Ajit's results in any given quarter or year. That bothers us not at all: As long as we are paid appropriately, we love taking on short-term volatility that others wish to shed. At Berkshire, we would rather earn a lumpy 15% over time than a smooth 12%.

If you see Ajit at our annual meeting, bow deeply.

* * * * * * * * * * * *

Berkshire's smaller insurers had an outstanding year. Their aggregate float grew by 38%, and they realized an underwriting profit of $32 million, or 4.5% of premiums. Collectively, these operations would make one of the finest insurance companies in the country.

Included in these figures, however, were terrible results in our California workers' compensation operation. There, we have work to do. There, too, our reserving severely missed the mark. Until we figure out how to get this business right, we will keep it small.

For the fabulous year they had in 2002, we thank Rod Eldred, John Kizer, Tom Nerney, Don Towle and Don Wurster. They added a lot of value to your Berkshire investment.

Sources of Reported Earnings

The table that follows shows the main sources of Berkshire's reported earnings. You will notice that "Purchase-Accounting Adjustments" dropped sharply in 2002, the reason being that GAAP rules changed then, no longer requiring the amortization of goodwill. This change increases our reported earnings, but has no effect on our economic earnings.

Here's a summary of major developments at our non-insurance businesses:

- MidAmerican Energy's earnings grew in 2002 and will likely do so again this year. Most of the increase, both present and expected, results from the acquisitions described earlier. To fund these, Berkshire purchased $1,273 million of MidAmerican junior debt (bringing our total holdings of these 11% obligations to $1,728 million) and also invested $402 million in a "common-equivalent" stock. We now own (on a fully-diluted basis) 80.2% of MidAmerican's equity. MidAmerican's financial statements are presented in detail on page 37.

- Last year I told you of the problems at Dexter that led to a huge loss in our shoe business. Thanks to Frank Rooney and Jim Issler of H.H. Brown, the Dexter operation has been turned around. Despite the cost of unwinding our problems there, we earned $24 million in shoes last year, an upward swing of $70 million from 2001.

  Randy Watson at Justin also contributed to this improvement, increasing margins significantly while trimming invested capital. Shoes are a tough business, but we have terrific managers and believe that in the future we will earn reasonable returns on the capital we employ in this operation.

- In a so-so year for home-furnishing and jewelry retailers, our operations did well. Among our eight retailing operations, the best performer was Homemaker's in Des Moines. There, the talented Merschman family achieved outstanding gains in both sales and profits.

  Nebraska Furniture Mart will open a new blockbuster store in metropolitan Kansas City in August. With 450,000 square feet of retail space, it could well produce the second largest volume of any furniture store in the country – the Omaha operation being the national champion. I hope Berkshire shareholders in the Kansas City area will come out for the opening (and keep coming).

- Our home and construction-related businesses – Acme Brick, Benjamin Moore Paint, Johns-Manville, MiTek and Shaw – delivered $941 million of pre-tax earnings last year. Of particular significance was Shaw's gain from $292 million in 2001 to $424 million. Bob Shaw and Julian Saul are terrific operators. Carpet prices increased only 1% last year, but Shaw's productivity gains and excellent expense control delivered significantly improved margins.

  We cherish cost-consciousness at Berkshire. Our model is the widow who went to the local newspaper to place an obituary notice. Told there was a 25-cents-a-word charge, she requested "Fred Brown died." She was then informed there was a seven-word minimum. "Okay" the bereaved woman replied, "make it 'Fred Brown died, golf clubs for sale'."

- Earnings from flight services increased last year – but only because we realized a special pre-tax gain of $60 million from the sale of our 50% interest in FlightSafety Boeing. Without this gain, earnings from our training business would have fallen slightly in concert with the slowdown in business-aviation activity. FlightSafety training continues to be the gold standard for the industry, and we expect growth in the years to come.

  At NetJets, our fractional-ownership operation, we are the runaway leader of the four-company field. FAA records indicate that our industry share in 2002 was 75%, meaning that clients purchased or leased planes from us that were valued at triple those recorded by our three competitors *combined*. Last year, our fleet flew 132.7 million nautical miles, taking clients to 130 countries.

  Our preeminence is directly attributable to Rich Santulli, NetJets' CEO. He invented the business in 1986 and ever since has exhibited an unbending devotion to the highest levels of service, safety and security. Rich, Charlie and I insist on planes (and personnel) worthy of carrying our own families – because they regularly do.

  Though NetJets revenues set a record in 2002, the company again lost money. A small profit in the U.S. was more than offset by losses in Europe. Overall, the fractional-ownership industry lost significant sums last year, and that is almost certain to be the outcome in 2003 as well. The bald fact is that airplanes are costly to operate.

  Over time, this economic reality should work to our advantage, given that for a great many companies, private aircraft are an essential business tool. And for most of these companies, NetJets makes compelling sense as either a primary or supplementary supplier of the aircraft they need.

  Many businesses could save millions of dollars annually by flying with us. Indeed, the yearly savings at some large companies could exceed $10 million. Equally important, these companies would actually increase their operational capabilities by using us. A fractional ownership of a single NetJets plane allows a client to have several planes in the air simultaneously. Additionally, through the interchange arrangement we make available, an owner of an interest in one plane can fly any of 12 other models, using whatever plane makes most sense for a mission. (One of my sisters owns a fraction of a Falcon 2000, which she uses for trips to Hawaii, but – exhibiting the Buffett gene – she interchanges to a more economical Citation Excel for short trips in the U.S.)

  The roster of NetJets users confirms the advantages we offer major businesses. Take General Electric, for example. It has a large fleet of its own but also has an unsurpassed knowledge of how to utilize aircraft effectively and economically. And it is our largest customer.

- Our finance and financial products line covers a variety of operations, among them certain activities in high-grade fixed-income securities that proved highly profitable in 2002. Earnings in this arena will probably continue for a while, but are certain to decrease – and perhaps disappear – in time.

This category also includes a highly satisfactory – but rapidly diminishing – income stream from our Berkadia investment in Finova (described in last year's report). Our partner, Leucadia National Corp., has managed this operation with great skill, willingly doing far more than its share of the heavy lifting. I like this division of labor and hope to join with Leucadia in future transactions.

On the minus side, the Finance line also includes the operations of General Re Securities, a derivatives and trading business. This entity lost $173 million pre-tax last year, a result that, in part, is a belated acknowledgment of faulty, albeit standard, accounting it used in earlier periods. Derivatives, in fact, deserve an extensive look, both in respect to the accounting their users employ and to the problems they may pose for both individual companies and our economy.

Derivatives

Charlie and I are of one mind in how we feel about derivatives and the trading activities that go with them: We view them as time bombs, both for the parties that deal in them and the economic system.

Having delivered that thought, which I'll get back to, let me retreat to explaining derivatives, though the explanation must be general because the word covers an extraordinarily wide range of financial contracts. Essentially, these instruments call for money to change hands at some future date, with the amount to be determined by one or more reference items, such as interest rates, stock prices or currency values. If, for example, you are either long or short an S&P 500 futures contract, you are a party to a very simple derivatives transaction – with your gain or loss *derived* from movements in the index. Derivatives contracts are of varying duration (running sometimes to 20 or more years) and their value is often tied to several variables.

Unless derivatives contracts are collateralized or guaranteed, their ultimate value also depends on the creditworthiness of the counterparties to them. In the meantime, though, before a contract is settled, the counterparties record profits and losses – often huge in amount – in their current earnings statements without so much as a penny changing hands.

The range of derivatives contracts is limited only by the imagination of man (or sometimes, so it seems, madmen). At Enron, for example, newsprint and broadband derivatives, due to be settled many years in the future, were put on the books. Or say you want to write a contract speculating on the number of twins to be born in Nebraska in 2020. No problem – at a price, you will easily find an obliging counterparty.

When we purchased Gen Re, it came with General Re Securities, a derivatives dealer that Charlie and I didn't want, judging it to be dangerous. We failed in our attempts to sell the operation, however, and are now terminating it.

But closing down a derivatives business is easier said than done. It will be a great many years before we are totally out of this operation (though we reduce our exposure daily). In fact, the reinsurance and derivatives businesses are similar: Like Hell, both are easy to enter and almost impossible to exit. In either industry, once you write a contract – which may require a large payment decades later – you are usually stuck with it. True, there are methods by which the risk can be laid off with others. But most strategies of that kind leave you with residual liability.

Another commonality of reinsurance and derivatives is that both generate reported earnings that are often wildly overstated. That's true because today's earnings are in a significant way based on estimates whose inaccuracy may not be exposed for many years.

Errors will usually be honest, reflecting only the human tendency to take an optimistic view of one's commitments. But the parties to derivatives also have enormous incentives to cheat in accounting for them. Those who trade derivatives are usually paid (in whole or part) on "earnings" calculated by mark-to-market accounting. But often there is no real market (think about our contract involving twins) and "mark-to-model" is utilized. This substitution can bring on large-scale mischief. As a general rule, contracts involving multiple reference items and distant settlement dates increase the opportunities for counterparties to use fanciful assumptions. In the twins scenario, for example, the two parties to the contract might well use differing models allowing *both* to show substantial profits for many years. In extreme cases, mark-to-model degenerates into what I would call mark-to-myth.

Of course, both internal and outside auditors review the numbers, but that's no easy job. For example, General Re Securities at yearend (after ten months of winding down its operation) had 14,384

contracts outstanding, involving 672 counterparties around the world. Each contract had a plus or minus value derived from one or more reference items, including some of mind-boggling complexity. Valuing a portfolio like that, expert auditors could easily and honestly have widely varying opinions.

The valuation problem is far from academic: In recent years, some huge-scale frauds and near-frauds have been facilitated by derivatives trades. In the energy and electric utility sectors, for example, companies used derivatives and trading activities to report great "earnings" – until the roof fell in when they actually tried to convert the derivatives-related receivables on their balance sheets into cash. "Mark-to-market" then turned out to be truly "mark-to-myth."

I can assure you that the marking errors in the derivatives business have not been symmetrical. Almost invariably, they have favored either the trader who was eyeing a multi-million dollar bonus or the CEO who wanted to report impressive "earnings" (or both). The bonuses were paid, and the CEO profited from his options. Only much later did shareholders learn that the reported earnings were a sham.

Another problem about derivatives is that they can exacerbate trouble that a corporation has run into for completely unrelated reasons. This pile-on effect occurs because many derivatives contracts require that a company suffering a credit downgrade immediately supply collateral to counterparties. Imagine, then, that a company is downgraded because of general adversity and that its derivatives instantly kick in with *their* requirement, imposing an unexpected and enormous demand for cash collateral on the company. The need to meet this demand can then throw the company into a liquidity crisis that may, in some cases, trigger still more downgrades. It all becomes a spiral that can lead to a corporate meltdown.

Derivatives also create a daisy-chain risk that is akin to the risk run by insurers or reinsurers that lay off much of their business with others. In both cases, huge receivables from many counterparties tend to build up over time. (At Gen Re Securities, we still have $6.5 billion of receivables, though we've been in a liquidation mode for nearly a year.) A participant may see himself as prudent, believing his large credit exposures to be diversified and therefore not dangerous. Under certain circumstances, though, an exogenous event that causes the receivable from Company A to go bad will also affect those from Companies B through Z. History teaches us that a crisis often causes problems to correlate in a manner undreamed of in more tranquil times.

In banking, the recognition of a "linkage" problem was one of the reasons for the formation of the Federal Reserve System. Before the Fed was established, the failure of weak banks would sometimes put sudden and unanticipated liquidity demands on previously-strong banks, causing them to fail in turn. The Fed now insulates the strong from the troubles of the weak. But there is no central bank assigned to the job of preventing the dominoes toppling in insurance or derivatives. In these industries, firms that are fundamentally solid can become troubled simply because of the travails of other firms further down the chain. When a "chain reaction" threat exists within an industry, it pays to minimize links of any kind. That's how we conduct our reinsurance business, and it's one reason we are exiting derivatives.

Many people argue that derivatives reduce systemic problems, in that participants who can't bear certain risks are able to transfer them to stronger hands. These people believe that derivatives act to stabilize the economy, facilitate trade, and eliminate bumps for individual participants. And, on a micro level, what they say is often true. Indeed, at Berkshire, I sometimes engage in large-scale derivatives transactions in order to facilitate certain investment strategies.

Charlie and I believe, however, that the macro picture is dangerous and getting more so. Large amounts of risk, particularly credit risk, have become concentrated in the hands of relatively few derivatives dealers, who in addition trade extensively with one other. The troubles of one could quickly infect the others. On top of that, these dealers are owed huge amounts by non-dealer counterparties. Some of these counterparties, as I've mentioned, are linked in ways that could cause them to contemporaneously run into a problem because of a single event (such as the implosion of the telecom industry or the precipitous decline in the value of merchant power projects). Linkage, when it suddenly surfaces, can trigger serious systemic problems.

Indeed, in 1998, the leveraged and derivatives-heavy activities of a single hedge fund, Long-Term Capital Management, caused the Federal Reserve anxieties so severe that it hastily orchestrated a rescue effort. In later Congressional testimony, Fed officials acknowledged that, had they not intervened, the outstanding trades of LTCM – a firm unknown to the general public and employing only a few hundred

people – could well have posed a serious threat to the stability of American markets. In other words, the Fed acted because its leaders were fearful of what might have happened to other financial institutions had the LTCM domino toppled. And this affair, though it paralyzed many parts of the fixed-income market for weeks, was far from a worst-case scenario.

One of the derivatives instruments that LTCM used was total-return swaps, contracts that facilitate 100% leverage in various markets, including stocks. For example, Party A to a contract, usually a bank, puts up all of the money for the purchase of a stock while Party B, without putting up any capital, agrees that at a future date it will receive any gain or pay any loss that the bank realizes.

Total-return swaps of this type make a joke of margin requirements. Beyond that, other types of derivatives severely curtail the ability of regulators to curb leverage and generally get their arms around the risk profiles of banks, insurers and other financial institutions. Similarly, even experienced investors and analysts encounter major problems in analyzing the financial condition of firms that are heavily involved with derivatives contracts. When Charlie and I finish reading the long footnotes detailing the derivatives activities of major banks, the only thing we understand is that we *don't* understand how much risk the institution is running.

The derivatives genie is now well out of the bottle, and these instruments will almost certainly multiply in variety and number until some event makes their toxicity clear. Knowledge of how dangerous they are has already permeated the electricity and gas businesses, in which the eruption of major troubles caused the use of derivatives to diminish dramatically. Elsewhere, however, the derivatives business continues to expand unchecked. Central banks and governments have so far found no effective way to control, or even monitor, the risks posed by these contracts.

Charlie and I believe Berkshire should be a fortress of financial strength – for the sake of our owners, creditors, policyholders and employees. We try to be alert to any sort of megacatastrophe risk, and that posture may make us unduly apprehensive about the burgeoning quantities of long-term derivatives contracts and the massive amount of uncollateralized receivables that are growing alongside. In our view, however, derivatives are financial weapons of mass destruction, carrying dangers that, while now latent, are potentially lethal.

Investments

Below we show our common stock investments. Those that had a market value of more than $500 million at the end of 2002 are itemized.

		12/31/02	
Shares	*Company*	*Cost*	*Market*
		(dollars in millions)	
151,610,700	American Express Company	$ 1,470	$ 5,359
200,000,000	The Coca-Cola Company	1,299	8,768
96,000,000	The Gillette Company	600	2,915
15,999,200	H&R Block, Inc.	255	643
6,708,760	M&T Bank	103	532
24,000,000	Moody's Corporation	499	991
1,727,765	The Washington Post Company	11	1,275
53,265,080	Wells Fargo & Company	306	2,497
	Others	4,621	5,383
	Total Common Stocks	$9,164	$28,363

We continue to do little in equities. Charlie and I are increasingly comfortable with our holdings in Berkshire's major investees because most of them have increased their earnings while their valuations have decreased. But we are not inclined to add to them. Though these enterprises have good prospects, we don't yet believe their shares are undervalued.

In our view, the same conclusion fits stocks generally. Despite three years of falling prices, which have significantly improved the attractiveness of common stocks, we still find *very* few that even mildly

interest us. That dismal fact is testimony to the insanity of valuations reached during The Great Bubble. Unfortunately, the hangover may prove to be proportional to the binge.

The aversion to equities that Charlie and I exhibit today is far from congenital. We love owning common stocks – if they can be purchased at attractive prices. In my 61 years of investing, 50 or so years have offered that kind of opportunity. There will be years like that again. Unless, however, we see a very high probability of at least 10% pre-tax returns (which translate to 6½-7% after corporate tax), we will sit on the sidelines. With short-term money returning less than 1% after-tax, sitting it out is no fun. But occasionally successful investing requires inactivity.

Last year we were, however, able to make sensible investments in a few "junk" bonds and loans. Overall, our commitments in this sector sextupled, reaching $8.3 billion by yearend.

Investing in junk bonds and investing in stocks are alike in certain ways: Both activities require us to make a price-value calculation and also to scan hundreds of securities to find the very few that have attractive reward/risk ratios. But there are important differences between the two disciplines as well. In stocks, we expect every commitment to work out well because we concentrate on conservatively financed businesses with strong competitive strengths, run by able and honest people. If we buy into these companies at sensible prices, losses should be rare. Indeed, during the 38 years we have run the company's affairs, gains from the equities we manage at Berkshire (that is, excluding those managed at General Re and GEICO) have exceeded losses by a ratio of about 100 to one.

Purchasing junk bonds, we are dealing with enterprises that are far more marginal. These businesses are usually overloaded with debt and often operate in industries characterized by low returns on capital. Additionally, the quality of management is sometimes questionable. Management may even have interests that are directly counter to those of debtholders. Therefore, we expect that we will have occasional large losses in junk issues. So far, however, we have done reasonably well in this field.

Corporate Governance

Both the ability and fidelity of managers have long needed monitoring. Indeed, nearly 2,000 years ago, Jesus Christ addressed this subject, speaking (Luke 16:2) approvingly of "a certain rich man" who told his manager, "Give an account of thy stewardship; for thou mayest no longer be steward."

Accountability and stewardship withered in the last decade, becoming qualities deemed of little importance by those caught up in the Great Bubble. As stock prices went up, the behavioral norms of managers went down. By the late '90s, as a result, CEOs who traveled the high road did not encounter heavy traffic.

Most CEOs, it should be noted, are men and women you would be happy to have as trustees for your children's assets or as next-door neighbors. Too many of these people, however, have in recent years behaved badly at the office, fudging numbers and drawing obscene pay for mediocre business achievements. These otherwise decent people simply followed the career path of Mae West: "I was Snow White but I drifted."

In theory, corporate boards should have prevented this deterioration of conduct. I last wrote about the responsibilities of directors in the 1993 annual report. (We will send you a copy of this discussion on request, or you may read it on the Internet in the Corporate Governance section of the 1993 letter.) There, I said that directors "should behave as if there was a single absentee owner, whose long-term interest they should try to further in all proper ways." This means that directors must get rid of a manager who is mediocre or worse, no matter how likable he may be. Directors must react as did the chorus-girl bride of an 85-year-old multimillionaire when he asked whether she would love him if he lost his money. "Of course," the young beauty replied, "I would miss you, but I would still love you."

In the 1993 annual report, I also said directors had another job: "If able but greedy managers over-reach and try to dip too deeply into the shareholders' pockets, directors must slap their hands." Since I wrote that, over-reaching has become common but few hands have been slapped.

Why have intelligent and decent directors failed so miserably? The answer lies not in inadequate laws – it's always been clear that directors are obligated to represent the interests of shareholders – but rather in what I'd call "boardroom atmosphere."

It's almost impossible, for example, in a boardroom populated by well-mannered people, to raise the question of whether the CEO should be replaced. It's equally awkward to question a proposed acquisition that has been endorsed by the CEO, particularly when his inside staff and outside advisors are present and unanimously support his decision. (They wouldn't be in the room if they didn't.) Finally, when the compensation committee – armed, as always, with support from a high-paid consultant – reports on a megagrant of options to the CEO, it would be like belching at the dinner table for a director to suggest that the committee reconsider.

These "social" difficulties argue for outside directors regularly meeting without the CEO – a reform that is being instituted and that I enthusiastically endorse. I doubt, however, that most of the other new governance rules and recommendations will provide benefits commensurate with the monetary and other costs they impose.

The current cry is for "independent" directors. It is certainly true that it is desirable to have directors who think and speak independently – but they must also be business-savvy, interested and shareholder-oriented. In my 1993 commentary, those are the three qualities I described as essential.

Over a span of 40 years, I have been on 19 public-company boards (excluding Berkshire's) and have interacted with perhaps 250 directors. Most of them were "independent" as defined by today's rules. But the great majority of these directors lacked at least one of the three qualities I value. As a result, their contribution to shareholder well-being was minimal at best and, too often, negative. These people, decent and intelligent though they were, simply did not know enough about business and/or care enough about shareholders to question foolish acquisitions or egregious compensation. My own behavior, I must ruefully add, frequently fell short as well: Too often I was silent when management made proposals that I judged to be counter to the interests of shareholders. In those cases, collegiality trumped independence.

So that we may further see the failings of "independence," let's look at a 62-year case study covering thousands of companies. Since 1940, federal law has mandated that a large proportion of the directors of investment companies (most of these mutual funds) be independent. The requirement was originally 40% and now it is 50%. In any case, the typical fund has long operated with a majority of directors who qualify as independent.

These directors and the entire board have many perfunctory duties, but in actuality have only two important responsibilities: obtaining the best possible investment manager and negotiating with that manager for the lowest possible fee. When you are seeking investment help yourself, those two goals are the only ones that count, and directors acting for other investors should have exactly the same priorities. Yet when it comes to independent directors pursuing either goal, their record has been absolutely pathetic.

Many thousands of investment-company boards meet annually to carry out the vital job of selecting who will manage the savings of the millions of owners they represent. Year after year the directors of Fund A select manager A, Fund B directors select manager B, etc. … in a zombie-like process that makes a mockery of stewardship. Very occasionally, a board will revolt. But for the most part, a monkey will type out a Shakespeare play before an "independent" mutual-fund director will suggest that his fund look at other managers, even if the incumbent manager has persistently delivered substandard performance. When they are handling their own money, of course, directors will look to alternative advisors – but it never enters their minds to do so when they are acting as fiduciaries for others.

The hypocrisy permeating the system is vividly exposed when a fund management company – call it "A" – is sold for a huge sum to Manager "B". Now the "independent" directors experience a "counter-revelation" and decide that Manager B is the best that can be found – even though B was available (and ignored) in previous years. Not so incidentally, B also could formerly have been hired at a far lower rate than is possible now that it has bought Manager A. That's because B has laid out a fortune to acquire A, and B must now recoup that cost through fees paid by the A shareholders who were "delivered" as part of the deal. (For a terrific discussion of the mutual fund business, read John Bogle's *Common Sense on Mutual Funds*.)

A few years ago, my daughter was asked to become a director of a family of funds managed by a major institution. The fees she would have received as a director were very substantial, enough to have increased her annual income by about 50% (a boost, she will tell you, she could use!). Legally, she would have been an independent director. But did the fund manager who approached her think there was *any* chance that she would think independently as to what advisor the fund should employ? Of course not. I am

proud to say that she showed *real* independence by turning down the offer. The fund, however, had no trouble filling the slot (and – surprise – the fund has not changed managers).

Investment company directors have failed as well in negotiating management fees (just as compensation committees of many American companies have failed to hold the compensation of their CEOs to sensible levels). If you or I were empowered, I can assure you that we could easily negotiate materially lower management fees with the incumbent managers of most mutual funds. And, believe me, if directors were promised a portion of any fee savings they realized, the skies would be filled with falling fees. Under the current system, though, reductions mean nothing to "independent" directors while meaning everything to managers. So guess who wins?

Having the right money manager, of course, is far more important to a fund than reducing the manager's fee. Both tasks are nonetheless the job of directors. And in stepping up to these all-important responsibilities, tens of thousands of "independent" directors, over more than six decades, have failed miserably. (They've succeeded, however, in taking care of themselves; their fees from serving on multiple boards of a single "family" of funds often run well into six figures.)

When the manager cares deeply and the directors don't, what's needed is a powerful countervailing force – and that's the missing element in today's corporate governance. Getting rid of mediocre CEOs and eliminating overreaching by the able ones requires action by owners – big owners. The logistics aren't that tough: The ownership of stock has grown increasingly concentrated in recent decades, and today it would be easy for institutional managers to exert their will on problem situations. Twenty, or even fewer, of the largest institutions, acting together, could effectively reform corporate governance at a given company, simply by withholding their votes for directors who were tolerating odious behavior. In my view, this kind of concerted action is the only way that corporate stewardship can be meaningfully improved.

Unfortunately, certain major investing institutions have "glass house" problems in arguing for better governance elsewhere; they would shudder, for example, at the thought of their own performance and fees being closely inspected by their own boards. But Jack Bogle of Vanguard fame, Chris Davis of Davis Advisors, and Bill Miller of Legg Mason are now offering leadership in getting CEOs to treat their owners properly. Pension funds, as well as other fiduciaries, will reap better investment returns in the future if they support these men.

The acid test for reform will be CEO compensation. Managers will cheerfully agree to board "diversity," attest to SEC filings and adopt meaningless proposals relating to process. What many will fight, however, is a hard look at their own pay and perks.

In recent years compensation committees too often have been tail-wagging puppy dogs meekly following recommendations by consultants, a breed not known for allegiance to the faceless shareholders who pay their fees. (If you can't tell whose side someone is on, they are *not* on yours.) True, each committee is required by the SEC to state its reasoning about pay in the proxy. But the words are usually boilerplate written by the company's lawyers or its human-relations department.

This costly charade should cease. Directors should not serve on compensation committees unless they are *themselves* capable of negotiating on behalf of owners. They should explain both how they think about pay and how they measure performance. Dealing with shareholders' money, moreover, they should behave as they would were it their own.

In the 1890s, Samuel Gompers described the goal of organized labor as "More!" In the 1990s, America's CEOs adopted his battle cry. The upshot is that CEOs have often amassed riches while their shareholders have experienced financial disasters.

Directors should stop such piracy. There's nothing wrong with paying well for truly exceptional business performance. But, for anything short of that, it's time for directors to shout "Less!" It would be a travesty if the bloated pay of recent years became a baseline for future compensation. Compensation committees should go back to the drawing boards.

* * * * * * * * * * * *

Rules that have been proposed and that are almost certain to go into effect will require changes in Berkshire's board, obliging us to add directors who meet the codified requirements for "independence."

Doing so, we will add a test that we believe is important, but far from determinative, in fostering independence: We will select directors who have huge and true ownership interests (that is, stock that they or their family have *purchased*, not been given by Berkshire or received via options), expecting those interests to influence their actions to a degree that dwarfs other considerations such as prestige and board fees.

That gets to an often-overlooked point about directors' compensation, which at public companies averages perhaps $50,000 annually. It baffles me how the many directors who look to these dollars for perhaps 20% or more of their annual income can be considered independent when Ron Olson, for example, who is on our board, may be deemed not independent because he receives a tiny percentage of his very large income from Berkshire legal fees. As the investment company saga suggests, a director whose moderate income is heavily dependent on directors' fees – and who hopes mightily to be invited to join other boards in order to earn more fees – is highly unlikely to offend a CEO or fellow directors, who in a major way will determine his reputation in corporate circles. If regulators believe that "significant" money taints independence (and it certainly can), they have overlooked a massive class of possible offenders.

At Berkshire, wanting our fees to be meaningless to our directors, we pay them only a pittance. Additionally, not wanting to insulate our directors from any corporate disaster we might have, we don't provide them with officers' and directors' liability insurance (an unorthodoxy that, not so incidentally, has saved our shareholders many millions of dollars over the years). Basically, we want the behavior of our directors to be driven by the effect their decisions will have on their family's net worth, not by their compensation. That's the equation for Charlie and me as managers, and we think it's the right one for Berkshire directors as well.

To find new directors, we will look through our shareholders list for people who directly, or in their family, have had large Berkshire holdings – in the millions of dollars – for a long time. Individuals making that cut should automatically meet two of our tests, namely that they be interested in Berkshire and shareholder-oriented. In our third test, we will look for business savvy, a competence that is far from commonplace.

Finally, we will continue to have members of the Buffett family on the board. They are not there to run the business after I die, nor will they then receive compensation of any kind. Their purpose is to ensure, for both our shareholders and managers, that Berkshire's special culture will be nurtured when I'm succeeded by other CEOs.

Any change we make in the composition of our board will not alter the way Charlie and I run Berkshire. We will continue to emphasize substance over form in our work and waste as little time as possible during board meetings in show-and-tell and perfunctory activities. The most important job of our board is likely to be the selection of successors to Charlie and me, and that is a matter upon which it will focus.

The board we have had up to now has overseen a shareholder-oriented business, consistently run in accord with the economic principles set forth on pages 68-74 (which I urge all new shareholders to read). Our goal is to obtain new directors who are equally devoted to those principles.

The Audit Committee

Audit committees can't audit. Only a company's outside auditor can determine whether the earnings that a management purports to have made are suspect. Reforms that ignore this reality and that instead focus on the structure and charter of the audit committee will accomplish little.

As we've discussed, far too many managers have fudged their company's numbers in recent years, using both accounting and operational techniques that are typically legal but that nevertheless materially mislead investors. Frequently, auditors knew about these deceptions. Too often, however, they remained silent. The key job of the audit committee is simply to get the auditors to divulge what they know.

To do this job, the committee must make sure that the auditors worry more about misleading its members than about offending management. In recent years auditors have not felt that way. They have instead generally viewed the CEO, rather than the shareholders or directors, as their client. That has been a natural result of day-to-day working relationships and also of the auditors' understanding that, no matter what the book says, the CEO and CFO pay their fees and determine whether they are retained for both auditing and other work. The rules that have been recently instituted won't materially change this reality. What *will* break

this cozy relationship is audit committees unequivocally putting auditors on the spot, making them understand they will become liable for major monetary penalties if they don't come forth with what they know or suspect.

In my opinion, audit committees can accomplish this goal by asking four questions of auditors, the answers to which should be recorded and reported to shareholders. These questions are:

1. If the auditor were solely responsible for preparation of the company's financial statements, would they have in any way been prepared differently from the manner selected by management? This question should cover both material and nonmaterial differences. If the auditor would have done something differently, both management's argument and the auditor's response should be disclosed. The audit committee should then evaluate the facts.

2. If the auditor were an investor, would he have received – in plain English – the information essential to his understanding the company's financial performance during the reporting period?

3. Is the company following the same internal audit procedure that would be followed if the auditor himself were CEO? If not, what are the differences and why?

4. Is the auditor aware of any actions – either accounting or operational – that have had the purpose and effect of moving revenues or expenses from one reporting period to another?

If the audit committee asks these questions, its composition – the focus of most reforms – is of minor importance. In addition, the procedure will save time and expense. When auditors are put on the spot, they will do their duty. If they are not put on the spot . . . well, we have seen the results of that.

The questions we have enumerated should be asked at least a week before an earnings report is released to the public. That timing will allow differences between the auditors and management to be aired with the committee and resolved. If the timing is tighter – if an earnings release is imminent when the auditors and committee interact – the committee will feel pressure to rubberstamp the prepared figures. Haste is the enemy of accuracy. My thinking, in fact, is that the SEC's recent shortening of reporting deadlines will hurt the quality of information that shareholders receive. Charlie and I believe that rule is a mistake and should be rescinded.

The primary advantage of our four questions is that they will act as a prophylactic. Once the auditors know that the audit committee will require them to affirmatively endorse, rather than merely acquiesce to, management's actions, they will resist misdoings early in the process, well before specious figures become embedded in the company's books. Fear of the plaintiff's bar will see to that.

* * * * * * * * * * * *

The Chicago Tribune ran a four-part series on Arthur Andersen last September that did a great job of illuminating how accounting standards and audit quality have eroded in recent years. A few decades ago, an Arthur Andersen audit opinion was the gold standard of the profession. Within the firm, an elite Professional Standards Group (PSG) insisted on honest reporting, no matter what pressures were applied by the client. Sticking to these principles, the PSG took a stand in 1992 that the cost of stock options should be recorded as the expense it clearly was. The PSG's position was reversed, however, by the "rainmaking" partners of Andersen who knew what their clients wanted – higher reported earnings no matter what the reality. Many CEOs also fought expensing because they knew that the obscene megagrants of options they craved would be slashed if the true costs of these had to be recorded.

Soon after the Andersen reversal, the independent accounting standards board (FASB) voted 7-0 for expensing options. Predictably, the major auditing firms and an army of CEOs stormed Washington to pressure the Senate – what better institution to decide accounting questions? – into castrating the FASB. The voices of the protesters were amplified by their large political contributions, usually made with corporate money belonging to the very owners about to be bamboozled. It was not a sight for a civics class.

To its shame, the Senate voted 88-9 against expensing. Several prominent Senators even called for the demise of the FASB if it didn't abandon its position. (So much for independence.) Arthur Levitt, Jr., then Chairman of the SEC – and generally a vigilant champion of shareholders – has since described his reluctant

bowing to Congressional and corporate pressures as the act of his chairmanship that he most regrets. (The details of this sordid affair are related in Levitt's excellent book, *Take on the Street*.)

With the Senate in its pocket and the SEC outgunned, corporate America knew that it was now boss when it came to accounting. With that, a new era of anything-goes earnings reports – blessed and, in some cases, encouraged by big-name auditors – was launched. The licentious behavior that followed quickly became an air pump for The Great Bubble.

After being threatened by the Senate, FASB backed off its original position and adopted an "honor system" approach, declaring expensing to be preferable but also allowing companies to ignore the cost if they wished. The disheartening result: Of the 500 companies in the S&P, 498 adopted the method deemed less desirable, which of course let them report higher "earnings." Compensation-hungry CEOs loved this outcome: Let FASB have the honor; *they* had the system.

In our 1992 annual report, discussing the unseemly and self-serving behavior of so many CEOs, I said "the business elite risks losing its credibility on issues of significance to society – about which it may have much of value to say – when it advocates the incredible on issues of significance to itself."

That loss of credibility has occurred. The job of CEOs is now to regain America's trust – and for the country's sake it's important that they do so. They will not succeed in this endeavor, however, by way of fatuous ads, meaningless policy statements, or structural changes of boards and committees. Instead, CEOs must embrace stewardship as a way of life and treat their owners as partners, not patsies. It's time for CEOs to walk the walk.

* * * * * * * * * * * *

Three suggestions for investors: First, beware of companies displaying weak accounting. If a company still does not expense options, or if its pension assumptions are fanciful, watch out. When managements take the low road in aspects that are visible, it is likely they are following a similar path behind the scenes. There is seldom just one cockroach in the kitchen.

Trumpeting EBITDA (earnings before interest, taxes, depreciation and amortization) is a particularly pernicious practice. Doing so implies that depreciation is not truly an expense, given that it is a "non-cash" charge. That's nonsense. In truth, depreciation is a particularly unattractive expense because the cash outlay it represents is paid up front, before the asset acquired has delivered any benefits to the business. Imagine, if you will, that at the beginning of this year a company paid all of its employees for the next ten years of their service (in the way they would lay out cash for a fixed asset to be useful for ten years). In the following nine years, compensation would be a "non-cash" expense – a reduction of a prepaid compensation asset established this year. Would anyone care to argue that the recording of the expense in years two through ten would be simply a bookkeeping formality?

Second, unintelligible footnotes usually indicate untrustworthy management. If you can't understand a footnote or other managerial explanation, it's usually because the CEO doesn't want you to. Enron's descriptions of certain transactions *still* baffle me.

Finally, be suspicious of companies that trumpet earnings projections and growth expectations. Businesses seldom operate in a tranquil, no-surprise environment, and earnings simply don't advance smoothly (except, of course, in the offering books of investment bankers).

Charlie and I not only don't know today what our businesses will earn *next year* – we don't even know what they will earn *next quarter*. We are suspicious of those CEOs who regularly claim they do know the future – and we become downright incredulous if they consistently reach their declared targets. Managers that always promise to "make the numbers" will at some point be tempted to *make up* the numbers.

Shareholder-Designated Contributions

About 97.3% of all eligible shares participated in Berkshire's 2002 shareholder-designated contributions program, with contributions totaling $16.5 million.

Cumulatively, over the 22 years of the program, Berkshire has made contributions of $197 million pursuant to the instructions of our shareholders. The rest of Berkshire's giving is done by our subsidiaries, which stick to the philanthropic patterns that prevailed before they were acquired (except that their former

owners themselves take on the responsibility for their personal charities). In aggregate, our subsidiaries made contributions of $24 million in 2002, including in-kind donations of $4 million.

To participate in future programs, you must own Class A shares that are registered in the name of the actual owner, not the nominee name of a broker, bank or depository. Shares not so registered on August 31, 2003 will be ineligible for the 2003 program. When you get the contributions form from us, return it promptly so that it does not get put aside or forgotten. Designations received after the due date will not be honored.

The Annual Meeting

This year's annual meeting will be held on Saturday, May 3, and once again we will be at the Civic Auditorium. The doors will open at 7 a.m., the movie will begin at 8:30, and the meeting itself will commence at 9:30. There will be a short break at noon for food. (Sandwiches will be available at the Civic's concession stands.) That interlude aside, Charlie and I will answer questions until 3:30. Give us your best shot.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. They do a terrific job for us each year, and I thank them for it.

In our usual fashion, we will run vans from the larger hotels to the meeting. Afterwards, the vans will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

Our exhibit area for Berkshire goods and services will be bigger and better than ever this year. So be prepared to *spend*. I think you will particularly enjoy visiting The Pampered Chef display, where you may run into Doris and Sheila.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 41 of the 49 jurisdictions in which we operate. Bring the details of your existing insurance and check out whether we can save you money.

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets® available for your inspection. Just ask a representative at the Civic about viewing any of these planes. If you buy what we consider an appropriate number of items during the weekend, you may well need your own plane to take them home. Furthermore, if you buy a fraction of a plane, I'll personally see that you get a three-pack of briefs from Fruit of the Loom.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing, which means we will be offering our shareholders a discount that is customarily given only to employees. We initiated this special pricing at NFM six years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $14.2 million in 2002.

To get the discount, you must make your purchases during the Thursday, May 1 through Monday, May 5 period and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. on weekdays and 10 a.m. to 6 p.m. on Sundays. On Saturday this year, from 6 p.m. to 10 p.m., we are having a special affair for shareholders only. I'll be there, eating hot dogs and drinking Coke.

Borsheim's — the largest jewelry store in the country except for Tiffany's Manhattan store — will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, May 2. The second, the main gala, will be from 9 a.m. to 5 p.m. on Sunday, May 4. Ask Charlie to autograph your *sales ticket*.

Shareholder prices will be available Thursday through Monday, so if you wish to avoid the large crowds that will assemble on Friday evening and Sunday, come at other times and identify yourself as a

shareholder. On Saturday, we will be open until 6 p.m. Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, so the more you buy, the more you save (or at least that's what my wife and daughter tell me).

In the mall outside of Borsheim's, we will have some of the world's top bridge experts available to play with our shareholders on Sunday afternoon. We expect Bob Hamman, Sharon Osberg, Fred Gitelman and Sheri Winestock to host tables. Patrick Wolff, twice U.S. chess champion, will also be in the mall, taking on all comers — blindfolded! Last year, Patrick played six games *simultaneously* — with his blindfold securely in place — and for the first time suffered a loss. (He won the other five games, however.) He's been training overtime ever since and is planning to start a new streak this year.

Additionally, Bill Robertie, one of only two players who have twice won the backgammon world championship, will be on hand to test your skill at that game. Finally, we will have a newcomer: Peter Morris, the winner of the World Scrabble Championship in 1991. Peter will play on five boards simultaneously (no blindfold for him, however) and will also allow his challengers to consult a Scrabble dictionary.

We are also going to test your vocal chords at the mall. My friend, Al Oehrle of Philadelphia, will be at the piano to play any song in any key. Susie and I will lead the singing. *She* is good.

Gorat's — my favorite steakhouse — will again be open exclusively for Berkshire shareholders on Sunday, May 4, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on Sunday, you must have a reservation. To make one, call 402-551-3733 on April 1 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. Show your sophistication by ordering a rare T-bone with a double order of hash browns.

There won't be a ball game this year. After my fastball was clocked at 5 mph last year, I decided to hang up my spikes. So I'll see you on Saturday night at NFM instead.

* * * * * * * * * * * *

Next year our meeting will be held at Omaha's new convention center. This switch in locations will allow us to hold the event on either Saturday or Monday, whichever the majority of you prefer. Using the enclosed special ballot, please vote for your preference – *but only if you are likely to attend in the future*.

We will make the Saturday/Monday decision based upon a count of shareholders, not shares. That is, a Class B shareholder owning one share will have a vote equal to that of a Class A shareholder owning many shares. If the vote is close, we will go with the preference of out-of-towners.

Again, please vote only if there is a reasonable chance that you will be attending some meetings in the future.

Warren E. Buffett
February 21, 2003 Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
2001	(6.2)	(11.9)	5.7
2002	10.0	(22.1)	32.1
2003	21.0	28.7	(7.7)
Average Annual Gain — 1965-2003	22.2	10.4	11.8
Overall Gain — 1964-2003	259,485	4,743	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2003 was $13.6 billion, which increased the per-share book value of both our Class A and Class B stock by 21%. Over the last 39 years (that is, since present management took over) per-share book value has grown from $19 to $50,498, a rate of 22.2% compounded annually.*

It's per-share intrinsic value that counts, however, not book value. Here, the news is good: Between 1964 and 2003, Berkshire morphed from a struggling northern textile business whose intrinsic value was less than book into a widely diversified enterprise worth far more than book. Our 39-year gain in intrinsic value has therefore somewhat exceeded our 22.2% gain in book. (For a better understanding of intrinsic value and the economic principles that guide Charlie Munger, my partner and Berkshire's vice-chairman, and me in running Berkshire, please read our Owner's Manual, beginning on page 69.)

Despite their shortcomings, book value calculations are useful at Berkshire as a slightly understated gauge for measuring the *long-term* rate of increase in our intrinsic value. The calculation is less relevant, however, than it once was in rating any single year's performance versus the S&P 500 index (a comparison we display on the facing page). Our equity holdings, including convertible preferreds, have fallen considerably as a percentage of our net worth, from an average of 114% in the 1980s, for example, to an average of 50% in 2000-03. Therefore, yearly movements in the stock market now affect a much smaller portion of our net worth than was once the case.

Nonetheless, Berkshire's long-term performance versus the S&P remains all-important. Our shareholders can buy the S&P through an index fund at very low cost. Unless we achieve gains in per-share intrinsic value in the future that outdo the S&P's performance, Charlie and I will be adding nothing to what you can accomplish on your own.

If we fail, we will have no excuses. Charlie and I operate in an ideal environment. To begin with, we are supported by an incredible group of men and women who run our operating units. If there were a Corporate Cooperstown, its roster would surely include many of our CEOs. Any shortfall in Berkshire's results will not be caused by our managers.

Additionally, we enjoy a rare sort of managerial freedom. Most companies are saddled with institutional constraints. A company's history, for example, may commit it to an industry that now offers limited opportunity. A more common problem is a shareholder constituency that pressures its manager to dance to Wall Street's tune. Many CEOs resist, but others give in and adopt operating and capital-allocation policies far different from those they would choose if left to themselves.

At Berkshire, neither history nor the demands of owners impede intelligent decision-making. When Charlie and I make mistakes, they are – in tennis parlance – unforced errors.

*****All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Operating Earnings

When valuations are similar, we strongly prefer owning businesses to owning stocks. During most of our years of operation, however, stocks were much the cheaper choice. We therefore sharply tilted our asset allocation in those years toward equities, as illustrated by the percentages cited earlier.

In recent years, however, we've found it hard to find significantly undervalued stocks, a difficulty greatly accentuated by the mushrooming of the funds we must deploy. Today, the number of stocks that can be purchased in large enough quantities to move the performance needle at Berkshire is a small fraction of the number that existed a decade ago. (Investment managers often profit far more from piling up assets than from handling those assets well. So when one tells you that increased funds won't hurt his investment performance, step back: His nose is about to grow.)

The shortage of attractively-priced stocks in which we can put large sums doesn't bother us, *providing* we can find companies to purchase that (1) have favorable and enduring economic characteristics; (2) are run by talented and honest managers and (3) are available at a sensible price. We have purchased a number of such businesses in recent years, though not enough to fully employ the gusher of cash that has come our way. In buying businesses, I've made some terrible mistakes, both of commission and omission. Overall, however, our acquisitions have led to decent gains in per-share earnings.

Below is a table that quantifies that point. But first we need to warn you that growth-rate presentations can be significantly distorted by a calculated selection of either initial or terminal dates. For example, if earnings are tiny in a beginning year, a long-term performance that was only mediocre can be made to appear sensational. That kind of distortion can come about because the company at issue was minuscule in the base year – which means that only a handful of insiders actually benefited from the touted performance – or because a larger company was then operating at just above breakeven. Picking a terminal year that is particularly buoyant will also favorably bias a calculation of growth.

The Berkshire Hathaway that present management assumed control of in 1965 had long been sizable. But in 1964, it earned only $175,586 or 15 cents per share, so close to breakeven that any calculation of earnings growth from that base would be meaningless. At the time, however, even those meager earnings looked good: Over the decade following the 1955 merger of Berkshire Fine Spinning Associates and Hathaway Manufacturing, the combined operation had lost $10.1 million and many thousands of employees had been let go. It was not a marriage made in heaven.

Against this background, we give you a picture of Berkshire's earnings growth that begins in 1968, but also includes subsequent base years spaced five years apart. A series of calculations is presented so that you can decide for yourself which period is most meaningful. I've started with 1968 because it was the first full year we operated National Indemnity, the initial acquisition we made as we began to expand Berkshire's business.

I don't believe that using 2003 as the terminal year distorts our calculations. It was a terrific year for our insurance business, but the big boost that gave to earnings was largely offset by the pathetically low interest rates we earned on our large holdings of cash equivalents (a condition that will not last). All figures shown below, it should be noted, *exclude* capital gains.

Year	*Operating Earnings in $ millions*	*Operating Earnings Per Share in $*	*Subsequent Compounded Growth Rate of Per-Share Earnings*
1964	.2	.15	Not meaningful (1964-2003)
1968	2.7	2.69	22.8% (1968-2003)
1973	11.9	12.18	20.8% (1973-2003)
1978	30.0	29.15	21.1% (1978-2003)
1983	48.6	45.60	24.3% (1983-2003)
1988	313.4	273.37	18.6% (1988-2003)
1993	477.8	413.19	23.9% (1993-2003)
1998	1,277.0	1,020.49	28.2% (1998-2003)
2003	5,422.0	3,531.32	

We will continue the capital allocation practices we have used in the past. If stocks become significantly cheaper than entire businesses, we will buy them aggressively. If selected bonds become attractive, as they did in 2002, we will again load up on these securities. Under *any* market or economic conditions, we will be happy to buy businesses that meet our standards. And, for those that do, the bigger the better. Our capital is underutilized now, but that will happen periodically. It's a painful condition to be in – but not as painful as doing something stupid. (I speak from experience.)

Overall, we are certain Berkshire's performance in the future will fall *far* short of what it has been in the past. Nonetheless, Charlie and I remain hopeful that we can deliver results that are modestly above average. That's what we're being paid for.

Acquisitions

As regular readers know, our acquisitions have often come about in strange ways. None, however, had a more unusual genesis than our purchase last year of Clayton Homes.

The unlikely source was a group of finance students from the University of Tennessee, and their teacher, Dr. Al Auxier. For the past five years, Al has brought his class to Omaha, where the group tours Nebraska Furniture Mart and Borsheim's, eats at Gorat's and then comes to Kiewit Plaza for a session with me. Usually about 40 students participate.

After two hours of give-and-take, the group traditionally presents me with a thank-you gift. (The doors stay locked until they do.) In past years it's been items such as a football signed by Phil Fulmer and a basketball from Tennessee's famous women's team.

This past February, the group opted for a book – which, luckily for me, was the recently-published autobiography of Jim Clayton, founder of Clayton Homes. I already knew the company to be the class act of the manufactured housing industry, knowledge I acquired after earlier making the mistake of buying some distressed junk debt of Oakwood Homes, one of the industry's largest companies. At the time of that purchase, I did not understand how atrocious consumer-financing practices had become throughout most of the manufactured housing industry. But I learned: Oakwood rather promptly went bankrupt.

Manufactured housing, it should be emphasized, can deliver very good value to home purchasers. Indeed, for decades, the industry has accounted for more than 15% of the homes built in the U.S. During those years, moreover, both the quality and variety of manufactured houses consistently improved.

Progress in design and construction was not matched, however, by progress in distribution and financing. Instead, as the years went by, the industry's business model increasingly centered on the ability of both the retailer and manufacturer to unload terrible loans on naive lenders. When "securitization" then became popular in the 1990s, further distancing the supplier of funds from the lending transaction, the industry's conduct went from bad to worse. Much of its volume a few years back came from buyers who shouldn't have bought, financed by lenders who shouldn't have lent. The consequence has been huge numbers of repossessions and pitifully low recoveries on the units repossessed.

Oakwood participated fully in the insanity. But Clayton, though it could not isolate itself from industry practices, behaved considerably better than its major competitors.

Upon receiving Jim Clayton's book, I told the students how much I admired his record and they took that message back to Knoxville, home of both the University of Tennessee and Clayton Homes. Al then suggested that I call Kevin Clayton, Jim's son and the CEO, to express my views directly. As I talked with Kevin, it became clear that he was both able and a straight-shooter.

Soon thereafter, I made an offer for the business based solely on Jim's book, my evaluation of Kevin, the public financials of Clayton and what I had learned from the Oakwood experience. Clayton's board was receptive, since it understood that the large-scale financing Clayton would need in the future might be hard to get. Lenders had fled the industry and securitizations, when possible at all, carried far

more expensive and restrictive terms than was previously the case. This tightening was particularly serious for Clayton, whose earnings significantly depended on securitizations.

Today, the manufactured housing industry remains awash in problems. Delinquencies continue high, repossessed units still abound and the number of retailers has been halved. A different business model is required, one that eliminates the ability of the retailer and salesman to pocket substantial money up front by making sales financed by loans that are destined to default. Such transactions cause hardship to both buyer and lender and lead to a flood of repossessions that then undercut the sale of new units. Under a proper model – one requiring significant down payments and shorter-term loans – the industry will likely remain much smaller than it was in the 90s. But it will deliver to home buyers an asset in which they will have equity, rather than disappointment, upon resale.

In the "full circle" department, Clayton has agreed to buy the assets of Oakwood. When the transaction closes, Clayton's manufacturing capacity, geographical reach and sales outlets will be substantially increased. As a byproduct, the debt of Oakwood that we own, which we bought at a deep discount, will probably return a small profit to us.

And the students? In October, we had a surprise "graduation" ceremony in Knoxville for the 40 who sparked my interest in Clayton. I donned a mortarboard and presented each student with both a PhD (for phenomenal, hard-working dealmaker) from Berkshire and a B share. Al got an A share. If you meet some of the new Tennessee shareholders at our annual meeting, give them your thanks. And ask them if they've read any good books lately.

* * * * * * * * * * * *

In early spring, Byron Trott, a Managing Director of Goldman Sachs, told me that Wal-Mart wished to sell its McLane subsidiary. McLane distributes groceries and nonfood items to convenience stores, drug stores, wholesale clubs, mass merchandisers, quick service restaurants, theaters and others. It's a good business, but one not in the mainstream of Wal-Mart's future. It's made to order, however, for us.

McLane has sales of about $23 billion, but operates on paper-thin margins – about 1% pre-tax – and will swell Berkshire's sales figures far more than our income. In the past, some retailers had shunned McLane because it was owned by their major competitor. Grady Rosier, McLane's superb CEO, has already landed some of these accounts – he was in full stride the day the deal closed – and more will come.

For several years, I have given my vote to Wal-Mart in the balloting for Fortune Magazine's "Most Admired" list. Our McLane transaction reinforced my opinion. To make the McLane deal, I had a single meeting of about two hours with Tom Schoewe, Wal-Mart's CFO, and we then shook hands. (He did, however, first call Bentonville). Twenty-nine days later Wal-Mart had its money. We did no "due diligence." We knew everything would be exactly as Wal-Mart said it would be – and it was.

I should add that Byron has now been instrumental in three Berkshire acquisitions. He understands Berkshire far better than any investment banker with whom we have talked and – it hurts me to say this – earns his fee. I'm looking forward to deal number four (as, I am sure, is he).

Taxes

On May 20, 2003, The Washington Post ran an op-ed piece by me that was critical of the Bush tax proposals. Thirteen days later, Pamela Olson, Assistant Secretary for Tax Policy at the U.S. Treasury, delivered a speech about the new tax legislation saying, "That means a certain midwestern oracle, who, it must be noted, has played the tax code like a fiddle, is still safe retaining all his earnings." I think she was talking about me.

Alas, my "fiddle playing" will not get me to Carnegie Hall – or even to a high school recital. Berkshire, on your behalf and mine, will send the Treasury $3.3 billion for tax on its 2003 income, a sum equaling 2½% of the total income tax paid by *all* U.S. corporations in fiscal 2003. (In contrast, Berkshire's market valuation is about 1% of the value of all American corporations.) Our payment will almost

certainly place us among our country's top ten taxpayers. Indeed, if only 540 taxpayers paid the amount Berkshire will pay, no other individual or corporation would have to pay *anything* to Uncle Sam. That's right: 290 million Americans and all other businesses would not have to pay a dime in income, social security, excise or estate taxes to the federal government. (Here's the math: Federal tax receipts, including social security receipts, in fiscal 2003 totaled $1.782 trillion and 540 "Berkshires," each paying $3.3 billion, would deliver the same $1.782 trillion.)

Our federal tax return for 2002 (2003 is not finalized), when we paid $1.75 billion, covered a mere 8,905 pages. As is required, we dutifully filed two copies of this return, creating a pile of paper seven feet tall. At World Headquarters, our small band of 15.8, though exhausted, momentarily flushed with pride: Berkshire, we felt, was surely pulling its share of our country's fiscal load.

But Ms. Olson sees things otherwise. And if that means Charlie and I need to try harder, we are ready to do so.

I do wish, however, that Ms. Olson would give me *some* credit for the progress I've already made. In 1944, I filed my first 1040, reporting my income as a thirteen-year-old newspaper carrier. The return covered three pages. After I claimed the appropriate business deductions, such as $35 for a bicycle, my tax bill was $7. I sent my check to the Treasury and it – without comment – promptly cashed it. We lived in peace.

* * * * * * * * * * * *

I can understand why the Treasury is now frustrated with Corporate America and prone to outbursts. But it should look to Congress and the Administration for redress, not to Berkshire.

Corporate income taxes in fiscal 2003 accounted for 7.4% of all federal tax receipts, down from a post-war peak of 32% in 1952. With one exception (1983), last year's percentage is the lowest recorded since data was first published in 1934.

Even so, tax breaks for corporations (and their investors, particularly large ones) were a major part of the Administration's 2002 and 2003 initiatives. If class warfare is being waged in America, my class is clearly winning. Today, many large corporations – run by CEOs whose fiddle-playing talents make your Chairman look like he is all thumbs – pay nothing close to the stated federal tax rate of 35%.

In 1985, Berkshire paid $132 million in federal income taxes, and all corporations paid $61 billion. The comparable amounts in 1995 were $286 million and $157 billion respectively. And, as mentioned, we will pay about $3.3 billion for 2003, a year when all corporations paid $132 billion. We hope our taxes continue to rise in the future – it will mean we are prospering – but we also hope that the rest of Corporate America antes up along with us. This might be a project for Ms. Olson to work on.

Corporate Governance

In judging whether Corporate America is serious about reforming itself, CEO pay remains the acid test. To date, the results aren't encouraging. A few CEOs, such as Jeff Immelt of General Electric, have led the way in initiating programs that are fair to managers and shareholders alike. Generally, however, his example has been more admired than followed.

It's understandable how pay got out of hand. When management hires employees, or when companies bargain with a vendor, the intensity of interest is equal on both sides of the table. One party's gain is the other party's loss, and the money involved has real meaning to both. The result is an honest-to-God negotiation.

But when CEOs (or their representatives) have met with compensation committees, too often one side – the CEO's – has cared far more than the other about what bargain is struck. A CEO, for example, will always regard the difference between receiving options for 100,000 shares or for 500,000 as monumental. To a comp committee, however, the difference may seem unimportant – particularly if, as

has been the case at most companies, neither grant will have any effect on reported earnings. Under these conditions, the negotiation often has a "play-money" quality.

Overreaching by CEOs greatly accelerated in the 1990s as compensation packages gained by the most avaricious– a title for which there was vigorous competition – were promptly replicated elsewhere. The couriers for this epidemic of greed were usually consultants and human relations departments, which had no trouble perceiving who buttered their bread. As one compensation consultant commented: "There are two classes of clients you don't want to offend – actual and potential."

In proposals for reforming this malfunctioning system, the cry has been for "independent" directors. But the question of what truly motivates independence has largely been neglected.

In last year's report, I took a look at how "independent" directors – as defined by statute – had performed in the mutual fund field. The Investment Company Act of 1940 mandated such directors, and that means we've had an extended test of what statutory standards produce. In our examination last year, we looked at the record of fund directors in respect to the two key tasks board members should perform – whether at a mutual fund business or any other. These two all-important functions are, first, to obtain (or retain) an able and honest manager and then to compensate that manager fairly.

Our survey was not encouraging. Year after year, at literally thousands of funds, directors had routinely rehired the incumbent management company, however pathetic its performance had been. Just as routinely, the directors had mindlessly approved fees that in many cases far exceeded those that could have been negotiated. Then, when a management company was sold – invariably at a huge price relative to tangible assets – the directors experienced a "counter-revelation" and immediately signed on with the new manager and accepted its fee schedule. In effect, the directors decided that whoever would pay the most for the old management company was the party that should manage the shareholders' money in the future.

Despite the lapdog behavior of independent fund directors, we did not conclude that they are bad people. They're not. But sadly, "boardroom atmosphere" almost invariably sedates their fiduciary genes.

On May 22, 2003, not long after Berkshire's report appeared, the Chairman of the Investment Company Institute addressed its membership about "The State of our Industry." Responding to those who have "weighed in about our perceived failings," he mused, "It makes me wonder what life would be like if we'd actually done something wrong."

Be careful what you wish for.

Within a few months, the world began to learn that many fund-management companies had followed policies that hurt the owners of the funds they managed, while simultaneously boosting the fees of the managers. Prior to their transgressions, it should be noted, these management companies were earning profit margins and returns on tangible equity that were the envy of Corporate America. Yet to swell profits further, they trampled on the interests of fund shareholders in an appalling manner.

So what are the directors of these looted funds doing? As I write this, I have seen none that have terminated the contract of the offending management company (though naturally that entity has often fired some of its employees). Can you imagine directors who had been personally defrauded taking such a boys-will-be-boys attitude?

To top it all off, at least one miscreant management company has put itself up for sale, undoubtedly hoping to receive a huge sum for "delivering" the mutual funds it has managed to the highest bidder among other managers. This is a travesty. Why in the world don't the directors of those funds simply select whomever they think is best among the bidding organizations and sign up with that party directly? The winner would consequently be spared a huge "payoff" to the former manager who, having flouted the principles of stewardship, deserves not a dime. Not having to bear that acquisition cost, the winner could surely manage the funds in question for a far lower ongoing fee than would otherwise have been the case. Any truly independent director should insist on this approach to obtaining a new manager.

The reality is that neither the decades-old rules regulating investment company directors nor the new rules bearing down on Corporate America foster the election of truly independent directors. In both instances, an individual who is receiving 100% of his income from director fees – and who may wish to enhance his income through election to other boards – is deemed independent. That is nonsense. The same rules say that Berkshire director and lawyer Ron Olson, who receives from us perhaps 3% of his very large income, does not qualify as independent because that 3% comes from legal fees Berkshire pays his firm rather than from fees he earns as a Berkshire director. Rest assured, 3% from any source would not torpedo Ron's independence. But getting 20%, 30% or 50% of their income from director fees might well temper the independence of many individuals, particularly if their overall income is not large. Indeed, I think it's clear that at mutual funds, it has.

* * * * * * * * * * *

Let me make a small suggestion to "independent" mutual fund directors. Why not simply affirm in each annual report that "(1) We have looked at other management companies and believe the one we have retained for the upcoming year is among the better operations in the field; and (2) we have negotiated a fee with our managers comparable to what other clients with equivalent funds would negotiate."

It does not seem unreasonable for shareholders to expect fund directors – who are often receiving fees that exceed $100,000 annually – to declare themselves on these points. Certainly these directors would satisfy themselves on both matters were they handing over a large chunk of their own money to the manager. If directors are unwilling to make these two declarations, shareholders should heed the maxim "If you don't know whose side someone is on, he's probably not on yours."

Finally, a disclaimer. A great many funds have been run well and conscientiously despite the opportunities for malfeasance that exist. The shareholders of these funds have benefited, and their managers have earned their pay. Indeed, if I were a director of certain funds, including some that charge above-average fees, I would enthusiastically make the two declarations I have suggested. Additionally, those index funds that are very low-cost (such as Vanguard's) are investor-friendly by definition and are the best selection for most of those who wish to own equities.

I am on my soapbox now only because the blatant wrongdoing that has occurred has betrayed the trust of so many millions of shareholders. Hundreds of industry insiders had to know what was going on, yet none publicly said a word. It took Eliot Spitzer, and the whistleblowers who aided him, to initiate a housecleaning. We urge fund directors to continue the job. Like directors throughout Corporate America, these fiduciaries must now decide whether their job is to work for owners or for managers.

Berkshire Governance

True independence – meaning the willingness to challenge a forceful CEO when something is wrong or foolish – is an enormously valuable trait in a director. It is also rare. The place to look for it is among high-grade people whose interests are in line with those of rank-and-file shareholders – *and are in line in a very big way*.

We've made that search at Berkshire. We now have eleven directors and *each* of them, combined with members of their families, owns more than $4 million of Berkshire stock. Moreover, all have held major stakes in Berkshire for many years. In the case of six of the eleven, family ownership amounts to at least hundreds of millions and dates back at least three decades. All eleven directors purchased their holdings in the market just as you did; we've never passed out options or restricted shares. Charlie and I love such honest-to-God ownership. After all, who ever washes a rental car?

In addition, director fees at Berkshire are nominal (as my son, Howard, periodically reminds me). Thus, the upside from Berkshire for all eleven is proportionately the same as the upside for any Berkshire shareholder. And it always will be.

The downside for Berkshire directors is actually worse than yours because we carry *no* directors and officers liability insurance. Therefore, if something really catastrophic happens on our directors' watch, they are exposed to losses that will far exceed yours.

The bottom line for our directors: You win, they win big; you lose, they lose big. Our approach might be called owner-capitalism. We know of no better way to engender true independence. (This structure does not guarantee perfect behavior, however: I've sat on boards of companies in which Berkshire had huge stakes and remained silent as questionable proposals were rubber-stamped.)

In addition to being independent, directors should have business savvy, a shareholder orientation and a genuine interest in the company. The rarest of these qualities is business savvy – and if it is lacking, the other two are of little help. Many people who are smart, articulate and admired have no real understanding of business. That's no sin; they may shine elsewhere. But they don't belong on corporate boards. Similarly, I would be useless on a medical or scientific board (though I would likely be welcomed by a chairman who wanted to run things his way). My name would dress up the list of directors, but I wouldn't know enough to critically evaluate proposals. Moreover, to cloak my ignorance, I would keep my mouth shut (if you can imagine that). In effect, I could be replaced, without loss, by a potted plant.

Last year, as we moved to change our board, I asked for self-nominations from shareholders who believed they had the requisite qualities to be a Berkshire director. Despite the lack of either liability insurance or meaningful compensation, we received more than twenty applications. Most were good, coming from owner-oriented individuals having family holdings of Berkshire worth well over $1 million. After considering them, Charlie and I – with the concurrence of our incumbent directors – asked four shareholders who did not nominate themselves to join the board: David Gottesman, Charlotte Guyman, Don Keough and Tom Murphy. These four people are all friends of mine, and I know their strengths well. They bring an extraordinary amount of business talent to Berkshire's board.

The primary job of our directors is to select my successor, either upon my death or disability, or when I begin to lose my marbles. (David Ogilvy had it right when he said: "Develop your eccentricities when young. That way, when you get older, people won't think you are going gaga." Charlie's family and mine feel that we overreacted to David's advice.)

At our directors' meetings we cover the usual run of housekeeping matters. But the real discussion – both with me in the room and absent – centers on the strengths and weaknesses of the four internal candidates to replace me.

Our board knows that the ultimate scorecard on its performance will be determined by the record of my successor. He or she will need to maintain Berkshire's culture, allocate capital and keep a group of America's best managers happy in their jobs. This isn't the toughest task in the world – the train is already moving at a good clip down the track – and I'm totally comfortable about it being done well by any of the four candidates we have identified. I have more than 99% of my net worth in Berkshire and will be happy to have my wife or foundation (depending on the order in which she and I die) continue this concentration.

Sector Results

As managers, Charlie and I want to give our owners the financial information and commentary we would wish to receive if our roles were reversed. To do this with both clarity and reasonable brevity becomes more difficult as Berkshire's scope widens. Some of our businesses have vastly different economic characteristics from others, which means that our consolidated statements, with their jumble of figures, make useful analysis almost impossible.

On the following pages, therefore, we will present some balance sheet and earnings figures from our four major categories of businesses along with commentary about each. We particularly want you to understand the limited circumstances under which we will use debt, since typically we shun it. We will not, however, inundate you with data that has no real value in calculating Berkshire's intrinsic value. Doing so would likely obfuscate the most important facts. One warning: When analyzing Berkshire, be

sure to remember that the company should be viewed as an unfolding movie, not as a still photograph. Those who focused in the past on only the snapshot of the day sometimes reached erroneous conclusions.

Insurance

Let's start with insurance – since that's where the money is.

The fountain of funds we enjoy in our insurance operations comes from "float," which is money that doesn't belong to us but that we temporarily hold. Most of our float arises because (1) premiums are paid upfront though the service we provide – insurance protection – is delivered over a period that usually covers a year and; (2) loss events that occur today do not always result in our immediately paying claims, since it sometimes takes years for losses to be reported (think asbestos), negotiated and settled.

Float is wonderful – *if* it doesn't come at a high price. The cost of float is determined by underwriting results, meaning how losses and expenses paid compare with premiums received. The property-casualty industry as a whole regularly operates at a substantial underwriting loss, and therefore often has a cost of float that is unattractive.

Overall, our results have been good. True, we've had five terrible years in which float cost us more than 10%. But in 18 of the 37 years Berkshire has been in the insurance business, we have operated at an underwriting profit, meaning we were actually *paid* for holding money. And the quantity of this cheap money has grown far beyond what I dreamed it could when we entered the business in 1967.

	Yearend Float (in $ millions)				
Year	*GEICO*	*General Re*	*Other Reinsurance*	*Other Primary*	*Total*
1967				20	20
1977			40	131	171
1987			701	807	1,508
1997	2,917		4,014	455	7,386
1998	3,125	14,909	4,305	415	22,754
1999	3,444	15,166	6,285	403	25,298
2000	3,943	15,525	7,805	598	27,871
2001	4,251	19,310	11,262	685	35,508
2002	4,678	22,207	13,396	943	41,224
2003	5,287	23,654	13,948	1,331	44,220

Last year was a standout. Float reached record levels and it came without cost as all major segments contributed to Berkshire's $1.7 billion pre-tax underwriting profit.

Our results have been exceptional for one reason: We have truly exceptional managers. Insurers sell a non-proprietary piece of paper containing a non-proprietary promise. Anyone can copy anyone else's product. No installed base, key patents, critical real estate or natural resource position protects an insurer's competitive position. Typically, brands do not mean much either.

The critical variables, therefore, are managerial brains, discipline and integrity. Our managers have all of these attributes – in spades. Let's take a look at these all-stars and their operations.

- General Re had been Berkshire's problem child in the years following our acquisition of it in 1998. Unfortunately, it was a 400-pound child, and its negative impact on our overall performance was large.

  That's behind us: Gen Re is fixed. Thank Joe Brandon, its CEO, and his partner, Tad Montross, for that. When I wrote you last year, I thought that discipline had been restored to both underwriting and reserving, and events during 2003 solidified my view.

That does not mean we will never have setbacks. Reinsurance is a business that is certain to deliver blows from time to time. But, under Joe and Tad, this operation will be a powerful engine driving Berkshire's future profitability.

Gen Re's financial strength, unmatched among reinsurers even as we started 2003, further improved during the year. Many of the company's competitors suffered credit downgrades last year, leaving Gen Re, and its sister operation at National Indemnity, as the only AAA-rated companies among the world's major reinsurers.

When insurers purchase reinsurance, they buy only a promise – one whose validity may not be tested for decades – and there are no promises in the reinsurance world equaling those offered by Gen Re and National Indemnity. Furthermore, unlike most reinsurers, we retain virtually all of the risks we assume. Therefore, our ability to pay is not dependent on the ability or willingness of others to reimburse us. This *independent* financial strength could be enormously important when the industry experiences the mega-catastrophe it surely will.

- Regular readers of our annual reports know of Ajit Jain's incredible contributions to Berkshire's prosperity over the past 18 years. He continued to pour it on in 2003. With a staff of only 23, Ajit runs one of the world's largest reinsurance operations, specializing in mammoth and unusual risks.

  Often, these involve assuming catastrophe risks – say, the threat of a large California earthquake – of a size far greater than any other reinsurer will accept. This means Ajit's results (and Berkshire's) will be lumpy. You should, therefore, expect his operation to have an occasional horrible year. Over time, however, you can be confident of a terrific result from this one-of-a-kind manager.

  Ajit writes some very unusual policies. Last year, for example, PepsiCo promoted a drawing that offered participants a chance to win a $1 billion prize. Understandably, Pepsi wished to lay off this risk, and we were the logical party to assume it. So we wrote a $1 billion policy, retaining the risk entirely for our own account. Because the prize, if won, was payable over time, our exposure in present-value terms was $250 million. (I helpfully suggested that any winner be paid $1 a year for a billion years, but that proposal didn't fly.) The drawing was held on September 14. Ajit and I held our breath, as did the finalist in the contest, and we left happier than he. PepsiCo has renewed for a repeat contest in 2004.

- GEICO was a fine insurance company when Tony Nicely took over as CEO in 1992. Now it is a great one. During his tenure, premium volume has increased from $2.2 billion to $8.1 billion, and our share of the personal-auto market has grown from 2.1% to 5.0%. More important, GEICO has paired these gains with outstanding underwriting performance.

  (We now pause for a commercial)

  It's been 67 years since Leo Goodwin created a great business idea at GEICO, one designed to save policyholders significant money. Go to Geico.com or call 1-800-847-7536 to see what we can do for you.

  (End of commercial)

  In 2003, both the number of inquiries coming into GEICO and its closure rate on these increased significantly. As a result our preferred policyholder count grew 8.2%, and our standard and non-standard policies grew 21.4%.

  GEICO's business growth creates a never-ending need for more employees and facilities. Our most recent expansion, announced in December, is a customer service center in – I'm delighted to say – Buffalo. Stan Lipsey, the publisher of our Buffalo News, was instrumental in bringing the city and GEICO together.

The key figure in this matter, however, was Governor George Pataki. His leadership and tenacity are why Buffalo will have 2,500 new jobs when our expansion is fully rolled out. Stan, Tony, and I – along with Buffalo – thank him for his help.

- Berkshire's smaller insurers had another terrific year. This group, run by Rod Eldred, John Kizer, Tom Nerney, Don Towle and Don Wurster, increased its float by 41%, while delivering an excellent underwriting profit. These men, though operating in unexciting ways, produce truly exciting results.

* * * * * * * * * * * *

We should point out again that in any given year a company writing long-tail insurance (coverages giving rise to claims that are often settled many years after the loss-causing event takes place) can report almost any earnings that the CEO desires. Too often the industry has reported wildly inaccurate figures by misstating liabilities. Most of the mistakes have been innocent. Sometimes, however, they have been intentional, their object being to fool investors and regulators. Auditors and actuaries have usually failed to prevent both varieties of misstatement.

I have failed on occasion too, particularly in not spotting Gen Re's unwitting underreserving a few years back. Not only did that mean we reported inaccurate figures to you, but the error also resulted in our paying very substantial taxes earlier than was necessary. Aaarrrggghh. I told you last year, however, that I thought our current reserving was at appropriate levels. So far, that judgment is holding up.

Here are Berkshire's pre-tax underwriting results by segment:

	Gain (Loss) in $ millions	
	2003	*2002*
Gen Re	$ 145	$(1,393)
Ajit's business excluding retroactive contracts	1,434	980
Ajit's retroactive contracts*	(387)	(433)
GEICO	452	416
Other Primary	74	32
Total	$1,718	$ (398)

*These contracts were explained on page 10 of the 2002 annual report, available on the Internet at www.berkshirehathaway.com. In brief, this segment consists of a few jumbo policies that are likely to produce underwriting losses (which are capped) but also provide unusually large amounts of float.

Regulated Utility Businesses

Through MidAmerican Energy Holdings, we own an 80.5% (fully diluted) interest in a wide variety of utility operations. The largest are (1) Yorkshire Electricity and Northern Electric, whose 3.7 million electric customers make it the third largest distributor of electricity in the U.K.; (2) MidAmerican Energy, which serves 689,000 electric customers in Iowa and; (3) Kern River and Northern Natural pipelines, which carry 7.8% of the natural gas transported in the United States.

Berkshire has three partners, who own the remaining 19.5%: Dave Sokol and Greg Abel, the brilliant managers of the business, and Walter Scott, a long-time friend of mine who introduced me to the company. Because MidAmerican is subject to the Public Utility Holding Company Act ("PUHCA"), Berkshire's voting interest is limited to 9.9%. Walter has the controlling vote.

Our limited voting interest forces us to account for MidAmerican in our financial statements in an abbreviated manner. Instead of our fully including its assets, liabilities, revenues and expenses in our statements, we record only a one-line entry in both our balance sheet and income account. It's likely that

some day, perhaps soon, either PUHCA will be repealed or accounting rules will change. Berkshire's consolidated figures would then take in all of MidAmerican, including the substantial debt it utilizes.

The size of this debt (which is not now, nor will it be, an obligation of Berkshire) is entirely appropriate. MidAmerican's diverse and stable utility operations assure that, even under harsh economic conditions, aggregate earnings will be ample to very comfortably service all debt.

At yearend, $1.578 billion of MidAmerican's most junior debt was payable to Berkshire. This debt has allowed acquisitions to be financed without our three partners needing to increase their already substantial investments in MidAmerican. By charging 11% interest, Berkshire is compensated fairly for putting up the funds needed for purchases, while our partners are spared dilution of their equity interests.

MidAmerican also owns a significant non-utility business, Home Services of America, the second largest real estate broker in the country. Unlike our utility operations, this business is highly cyclical, but nevertheless one we view enthusiastically. We have an exceptional manager, Ron Peltier, who, through both his acquisition and operational skills, is building a brokerage powerhouse.

Last year, Home Services participated in $48.6 billion of transactions, a gain of $11.7 billion from 2002. About 23% of the increase came from four acquisitions made during the year. Through our 16 brokerage firms – all of which retain their local identities – we employ 16,343 brokers in 16 states. Home Services is almost certain to grow substantially in the next decade as we continue to acquire leading localized operations.

* * * * * * * * * * * *

Here's a tidbit for fans of free enterprise. On March 31, 1990, the day electric utilities in the U.K. were denationalized, Northern and Yorkshire had 6,800 employees in functions these companies continue today to perform. Now they employ 2,539. Yet the companies are serving about the same number of customers as when they were government owned and are distributing more electricity.

This is not, it should be noted, a triumph of deregulation. Prices and earnings continue to be regulated in a fair manner by the government, just as they should be. It is a victory, however, for those who believe that profit-motivated managers, even though they recognize that the benefits will largely flow to customers, will find efficiencies that government never will.

Here are some key figures on MidAmerican's operations:

	Earnings (in $ millions)	
	2003	*2002*
U.K. Utilities	$ 289	$ 267
Iowa	269	241
Pipelines	261	104
Home Services	113	70
Other (Net)	144	108
Earnings before corporate interest and tax	1,076	790
Corporate Interest, other than to Berkshire	(225)	(192)
Interest Payments to Berkshire	(184)	(118)
Tax	(251)	(100)
Net Earnings	$ 416	$ 380
Earnings Applicable to Berkshire*	$ 429	$ 359
Debt Owed to Others	10,296	10,286
Debt Owed to Berkshire	1,578	1,728

*Includes interest paid to Berkshire (net of related income taxes) of $118 in 2003 and $75 in 2002.

Finance and Financial Products

This sector includes a wide-ranging group of activities. Here's some commentary on the most important.

- I manage a few opportunistic strategies in AAA fixed-income securities that have been quite profitable in the last few years. These opportunities come and go – and at present, they are going. We sped their departure somewhat last year, thereby realizing 24% of the capital gains we show in the table that follows.

  Though far from foolproof, these transactions involve no credit risk and are conducted in exceptionally liquid securities. We therefore finance the positions almost entirely with borrowed money. As the assets are reduced, so also are the borrowings. The smaller portfolio we now have means that in the near future our earnings in this category will decline significantly. It was fun while it lasted, and at some point we'll get another turn at bat.

- A far less pleasant unwinding operation is taking place at Gen Re Securities, the trading and derivatives operation we inherited when we purchased General Reinsurance.

  When we began to liquidate Gen Re Securities in early 2002, it had 23,218 outstanding tickets with 884 counterparties (some having names I couldn't pronounce, much less creditworthiness I could evaluate). Since then, the unit's managers have been skillful and diligent in unwinding positions. Yet, at yearend – nearly two years later – we still had 7,580 tickets outstanding with 453 counterparties. (As the country song laments, "How can I miss you if you won't go away?")

  The shrinking of this business has been costly. We've had pre-tax losses of $173 million in 2002 and $99 million in 2003. These losses, it should be noted, came from a portfolio of contracts that – in full compliance with GAAP – had been regularly marked-to-market with standard allowances for future credit-loss and administrative costs. Moreover, our liquidation has taken place both in a benign market – we've had no credit losses of significance – and in an orderly manner. This is just the opposite of what might be expected if a financial crisis forced a number of derivatives dealers to cease operations simultaneously.

  If our derivatives experience – and the Freddie Mac shenanigans of mind-blowing size and audacity that were revealed last year – makes you suspicious of accounting in this arena, consider yourself wised up. No matter how financially sophisticated you are, you can't possibly learn from reading the disclosure documents of a derivatives-intensive company what risks lurk in its positions. Indeed, the more you know about derivatives, the less you will feel you can learn from the disclosures normally proffered you. In Darwin's words, "Ignorance more frequently begets confidence than does knowledge."

  * * * * * * * * * * *

  And now it's confession time: I'm sure I could have saved you $100 million or so, pre-tax, if I had acted more promptly to shut down Gen Re Securities. Both Charlie and I knew at the time of the General Reinsurance merger that its derivatives business was unattractive. Reported profits struck us as illusory, and we felt that the business carried sizable risks that could not effectively be measured or limited. Moreover, we knew that any major problems the operation might experience would likely correlate with troubles in the financial or insurance world that would affect Berkshire elsewhere. In other words, if the derivatives business were ever to need shoring up, it would commandeer the capital and credit of Berkshire at just the time we could otherwise deploy those resources to huge advantage. (A historical note: We had just such an experience in 1974 when we were the victim of a major insurance fraud. We could not determine for some time how much the fraud would ultimately cost us and therefore kept more funds in cash-equivalents than we normally would have.

Absent this precaution, we would have made larger purchases of stocks that were then extraordinarily cheap.)

Charlie would have moved swiftly to close down Gen Re Securities – no question about that. I, however, dithered. As a consequence, our shareholders are paying a far higher price than was necessary to exit this business.

- Though we include Gen Re's sizable life and health reinsurance business in the "insurance" sector, we show the results for Ajit Jain's life and annuity business in this section. That's because this business, in large part, involves arbitraging money. Our annuities range from a retail product sold directly on the Internet to structured settlements that require us to make payments for 70 years or more to people severely injured in accidents.

  We've realized some extra income in this business because of accelerated principal payments we received from certain fixed-income securities we had purchased at discounts. This phenomenon has ended, and earnings are therefore likely to be lower in this segment during the next few years.

- We have a $604 million investment in Value Capital, a partnership run by Mark Byrne, a member of a family that has helped Berkshire over the years in many ways. Berkshire is a limited partner in, and has no say in the management of, Mark's enterprise, which specializes in highly-hedged fixed-income opportunities. Mark is smart and honest and, along with his family, has a significant investment in Value.

  Because of accounting abuses at Enron and elsewhere, rules will soon be instituted that are likely to require that Value's assets and liabilities be consolidated on Berkshire's balance sheet. We regard this requirement as inappropriate, given that Value's liabilities – which usually are above $20 billion – are in no way ours. Over time, other investors will join us as partners in Value. When enough do, the need for us to consolidate Value will disappear.

- We have told you in the past about Berkadia, the partnership we formed three years ago with Leucadia to finance and manage the wind-down of Finova, a bankrupt lending operation. The plan was that we would supply most of the capital and Leucadia would supply most of the brains. And that's the way it has worked. Indeed, Joe Steinberg and Ian Cumming, who together run Leucadia, have done such a fine job in liquidating Finova's portfolio that the $5.6 billion guarantee we took on in connection with the transaction has been extinguished. The unfortunate byproduct of this fast payoff is that our future income will be much reduced. Overall, Berkadia has made excellent money for us, and Joe and Ian have been terrific partners.

- Our leasing businesses are XTRA (transportation equipment) and CORT (office furniture). Both operations have had poor earnings during the past two years as the recession caused demand to drop considerably more than was anticipated. They remain leaders in their fields, and I expect at least a modest improvement in their earnings this year.

- Through our Clayton purchase, we acquired a significant manufactured-housing finance operation. Clayton, like others in this business, had traditionally securitized the loans it originated. The practice relieved stress on Clayton's balance sheet, but a by-product was the "front-ending" of income (a result dictated by GAAP).

  We are in no hurry to record income, have enormous balance-sheet strength, and believe that over the long-term the economics of holding our consumer paper are superior to what we can now realize through securitization. So Clayton has begun to retain its loans.

  We believe it's appropriate to finance a soundly-selected book of interest-bearing receivables almost entirely with debt (just as a bank would). Therefore, Berkshire will borrow money to finance Clayton's portfolio and re-lend these funds to Clayton at our cost plus one percentage

point. This markup fairly compensates Berkshire for putting its exceptional creditworthiness to work, but it still delivers money to Clayton at an attractive price.

In 2003, Berkshire did $2 billion of such borrowing and re-lending, with Clayton using much of this money to fund several large purchases of portfolios from lenders exiting the business. A portion of our loans to Clayton also provided "catch-up" funding for paper it had generated earlier in the year from its own operation and had found difficult to securitize.

You may wonder why we borrow money while sitting on a mountain of cash. It's because of our "every tub on its own bottom" philosophy. We believe that any subsidiary lending money should pay an appropriate rate for the funds needed to carry its receivables and should not be subsidized by its parent. Otherwise, having a rich daddy can lead to sloppy decisions. Meanwhile, the cash we accumulate at Berkshire is destined for business acquisitions or for the purchase of securities that offer opportunities for significant profit. Clayton's loan portfolio will likely grow to at least $5 billion in not too many years and, with sensible credit standards in place, should deliver significant earnings.

For simplicity's sake, we include all of Clayton's earnings in this sector, though a sizable portion is derived from areas other than consumer finance.

	(in $ millions)			
	Pre-Tax Earnings		*Interest-bearing Liabilities*	
	2003	*2002*	*2003*	*2002*

** From date of acquisition, August 7, 2003

Manufacturing, Service and Retailing Operations

Our activities in this category cover the waterfront. But let's look at a simplified balance sheet and earnings statement consolidating the entire group.

Balance Sheet 12/31/03 (in $ millions)

Assets		*Liabilities and Equity*	
Cash and equivalents	$ 1,250	Notes payable	$ 1,593
Accounts and notes receivable	2,796	Other current liabilities	4,300
Inventory	3,656	Total current liabilities	5,893
Other current assets	262		
Total current assets	7,964		
Goodwill and other intangibles	8,351	Deferred taxes	105
Fixed assets	5,898	Term debt and other liabilities	1,890
Other assets	1,054	Equity	15,379
	$23,267		$23,267

Earnings Statement (in $ millions)

	2003	2002
Revenues	$32,106	$16,970
Operating expenses (including depreciation of $605 in 2003 and $477 in 2002)	29,885	14,921
Interest expense (net)	64	108
Pre-tax income	2,157	1,941
Income taxes	813	743
Net income	$ 1,344	$ 1,198

This eclectic group, which sells products ranging from Dilly Bars to B-737s, earned a hefty 20.7% on average tangible net worth last year. However, we purchased these businesses at substantial premiums to net worth – that fact is reflected in the goodwill item shown on the balance sheet – and that reduces the earnings on our average *carrying* value to 9.2%.

Here are the pre-tax earnings for the larger categories or units.

	Pre-Tax Earnings (in $ millions)	
	2003	2002
Building Products	$ 559	$ 516
Shaw Industries	436	424
Apparel	289	229
Retail Operations	224	219
Flight Services	72	225
McLane *	150	—
Other businesses	427	328
	$2,157	$1,941

* From date of acquisition, May 23, 2003.

- Three of our building-materials businesses – Acme Brick, Benjamin Moore and MiTek – had record operating earnings last year. And earnings at Johns Manville, the fourth, were trending upward at yearend. Collectively, these companies earned 21.0% on tangible net worth.

- Shaw Industries, the world's largest manufacturer of broadloom carpet, also had a record year. Led by Bob Shaw, who built this huge enterprise from a standing start, the company will likely set another earnings record in 2004. In November, Shaw acquired various carpet operations from Dixie Group, which should add about $240 million to sales this year, boosting Shaw's volume to nearly $5 billion.

- Within the apparel group, Fruit of the Loom is our largest operation. Fruit has three major assets: a 148-year-old universally-recognized brand, a low-cost manufacturing operation, and John Holland, its CEO. In 2003, Fruit accounted for 42.3% of the men's and boys' underwear that was sold by mass marketers (Wal-Mart, Target, K-Mart, etc.) and increased its share of the women's and girls' business in that channel to 13.9%, up from 11.3% in 2002.

- In retailing, our furniture group earned $106 million pre-tax, our jewelers $59 million and See's, which is both a manufacturer and retailer, $59 million.

  Both R.C. Willey and Nebraska Furniture Mart ("NFM") opened hugely successful stores last year, Willey in Las Vegas and NFM in Kansas City, Kansas. Indeed, we believe the Kansas City store is the country's largest-volume home-furnishings store. (Our Omaha operation, while located on a single plot of land, consists of three units.)

NFM was founded by Rose Blumkin ("Mrs. B") in 1937 with $500. She worked until she was 103 (hmmm . . . not a bad idea). One piece of wisdom she imparted to the generations following her was, "If you have the lowest price, customers will find you at the bottom of a river." Our store serving greater Kansas City, which is located in one of the area's more sparsely populated parts, has proved Mrs. B's point. Though we have more than 25 acres of parking, the lot has at times overflowed.

"Victory," President Kennedy told us after the Bay of Pigs disaster, "has a thousand fathers, but defeat is an orphan." At NFM, we knew we had a winner a month after the boffo opening in Kansas City, when our new store attracted an unexpected paternity claim. A speaker there, referring to the Blumkin family, asserted, "They had enough confidence and the policies of the Administration were working such that they were able to provide work for 1,000 of our fellow citizens." The proud papa at the podium? President George W. Bush.

- In flight services, FlightSafety, our training operation, experienced a drop in "normal" operating earnings from $183 million to $150 million. (The abnormals: In 2002 we had a $60 million pre-tax gain from the sale of a partnership interest to Boeing, and in 2003 we recognized a $37 million loss stemming from the premature obsolescence of simulators.) The corporate aviation business has slowed significantly in the past few years, and this fact has hurt FlightSafety's results. The company continues, however, to be far and away the leader in its field. Its simulators have an original cost of $1.2 billion, which is more than triple the cost of those operated by our closest competitor.

  NetJets, our fractional-ownership operation lost $41 million pre-tax in 2003. The company had a modest operating profit in the U.S., but this was more than offset by a $32 million loss on aircraft inventory and by continued losses in Europe.

  NetJets continues to dominate the fractional-ownership field, and its lead is increasing: Prospects overwhelmingly turn to us rather than to our three major competitors. Last year, among the four of us, we accounted for 70% of net sales (measured by value).

  An example of what sets NetJets apart from competitors is our Mayo Clinic Executive Travel Response program, a free benefit enjoyed by all of our owners. On land or in the air, anywhere in the world and at any hour of any day, our owners and their families have an immediate link to Mayo. Should an emergency occur while they are traveling here or abroad, Mayo will instantly direct them to an appropriate doctor or hospital. Any baseline data about the patient that Mayo possesses is simultaneously made available to the treating physician. Many owners have already found this service invaluable, including one who needed emergency brain surgery in Eastern Europe.

  The $32 million inventory write-down we took in 2003 occurred because of falling prices for used aircraft early in the year. Specifically, we bought back fractions from withdrawing owners at prevailing prices, and these fell in value before we were able to remarket them. Prices are now stable.

  The European loss is painful. But any company that forsakes Europe, as all of our competitors have done, is destined for second-tier status. Many of our U.S. owners fly extensively in Europe and want the safety and security assured by a NetJets plane and pilots. Despite a slow start, furthermore, we are now adding European customers at a good pace. During the years 2001 through 2003, we had gains of 88%, 61% and 77% in European management-and-flying revenues. We have not, however, yet succeeded in stemming the flow of red ink.

  Rich Santulli, NetJets' extraordinary CEO, and I expect our European loss to diminish in 2004 and also anticipate that it will be more than offset by U.S. profits. Overwhelmingly, our owners love the NetJets experience. Once a customer has tried us, going back to commercial aviation is like going back to holding hands. NetJets will become a very big business over time and will be one in which we are preeminent in both customer satisfaction and profits. Rich will see to that.

Investments

The table that follows shows our common stock investments. Those that had a market value of more than $500 million at the end of 2003 are itemized.

Shares	*Company*	*Percentage of Company Owned*	*12/31/03 Cost*	*Market*
			(in $ millions)	
151,610,700	American Express Company	11.8	$ 1,470	$ 7,312
200,000,000	The Coca-Cola Company	8.2	1,299	10,150
96,000,000	The Gillette Company	9.5	600	3,526
14,610,900	H&R Block, Inc.	8.2	227	809
15,476,500	HCA Inc.	3.1	492	665
6,708,760	M&T Bank Corporation	5.6	103	659
24,000,000	Moody's Corporation	16.1	499	1,453
2,338,961,000	PetroChina Company Limited	1.3	488	1,340
1,727,765	The Washington Post Company	18.1	11	1,367
56,448,380	Wells Fargo & Company	3.3	463	3,324
	Others		2,863	4,682
	Total Common Stocks		$ 8,515	$35,287

We bought some Wells Fargo shares last year. Otherwise, among our six largest holdings, we last changed our position in Coca-Cola in 1994, American Express in 1998, Gillette in 1989, Washington Post in 1973, and Moody's in 2000. Brokers don't love us.

We are neither enthusiastic nor negative about the portfolio we hold. We own pieces of excellent businesses – all of which had good gains in intrinsic value last year – but their current prices reflect their excellence. The unpleasant corollary to this conclusion is that I made a big mistake in not selling several of our larger holdings during The Great Bubble. If these stocks are fully priced now, you may wonder what I was thinking four years ago when their intrinsic value was lower and their prices far higher. So do I.

In 2002, junk bonds became very cheap, and we purchased about $8 billion of these. The pendulum swung quickly though, and this sector now looks decidedly unattractive to us. Yesterday's weeds are today being priced as flowers.

We've repeatedly emphasized that realized gains at Berkshire are meaningless for analytical purposes. We have a huge amount of unrealized gains on our books, and our thinking about when, and if, to cash them depends not at all on a desire to report earnings at one specific time or another. Nevertheless, to see the diversity of our investment activities, you may be interested in the following table, categorizing the gains we reported during 2003:

Category	*Pre-Tax Gain (in $ million)*
Common Stocks	$ 448
U.S. Government Bonds	1,485
Junk Bonds	1,138
Foreign Exchange Contracts	825
Other	233
	$4,129

The common stock profits occurred around the edges of our portfolio – not, as we already mentioned, from our selling down our major positions. The profits in governments arose from our

liquidation of long-term strips (the most volatile of government securities) and from certain strategies I follow within our finance and financial products division. We retained most of our junk portfolio, selling only a few issues. Calls and maturing bonds accounted for the rest of the gains in the junk category.

During 2002 we entered the foreign currency market for the first time in my life, and in 2003 we enlarged our position, as I became increasingly bearish on the dollar. I should note that the cemetery for seers has a huge section set aside for macro forecasters. We have in fact made few macro forecasts at Berkshire, and we have seldom seen others make them with sustained success.

We have – and will continue to have – the bulk of Berkshire's net worth in U.S. assets. But in recent years our country's trade deficit has been force-feeding huge amounts of claims on, and ownership in, America to the rest of the world. For a time, foreign appetite for these assets readily absorbed the supply. Late in 2002, however, the world started choking on this diet, and the dollar's value began to slide against major currencies. Even so, prevailing exchange rates will not lead to a material letup in our trade deficit. So whether foreign investors like it or not, they will continue to be flooded with dollars. The consequences of this are anybody's guess. They could, however, be troublesome – and reach, in fact, well beyond currency markets.

As an American, I hope there is a benign ending to this problem. I myself suggested one possible solution – which, incidentally, leaves Charlie cold – in a November 10, 2003 article in Fortune Magazine. Then again, perhaps the alarms I have raised will prove needless: Our country's dynamism and resiliency have repeatedly made fools of naysayers. But Berkshire holds many billions of cash-equivalents denominated in dollars. So I feel more comfortable owning foreign-exchange contracts that are at least a partial offset to that position.

These contracts are subject to accounting rules that require changes in their value to be contemporaneously included in capital gains or losses, even though the contracts have not been closed. We show these changes each quarter in the Finance and Financial Products segment of our earnings statement. At yearend, our open foreign exchange contracts totaled about $12 billion at market values and were spread among five currencies. Also, when we were purchasing junk bonds in 2002, we tried when possible to buy issues denominated in Euros. Today, we own about $1 billion of these.

When we can't find anything exciting in which to invest, our "default" position is U.S. Treasuries, both bills and repos. No matter how low the yields on these instruments go, we never "reach" for a little more income by dropping our credit standards or by extending maturities. Charlie and I detest taking even small risks unless we feel we are being adequately compensated for doing so. About as far as we will go down that path is to occasionally eat cottage cheese a day after the expiration date on the carton.

* * * * * * * * * * * *

A 2003 book that investors can learn much from is *Bull!* by Maggie Mahar. Two other books I'd recommend are *The Smartest Guys in the Room* by Bethany McLean and Peter Elkind, and *In an Uncertain World* by Bob Rubin. All three are well-reported and well-written. Additionally, Jason Zweig last year did a first-class job in revising *The Intelligent Investor*, my favorite book on investing.

Designated Gifts Program

From 1981 through 2002, Berkshire administered a program whereby shareholders could direct Berkshire to make gifts to their favorite charitable organizations. Over the years we disbursed $197 million pursuant to this program. Churches were the most frequently named designees, and many thousands of other organizations benefited as well. We were the only major public company that offered such a program to shareholders, and Charlie and I were proud of it.

We reluctantly terminated the program in 2003 because of controversy over the abortion issue. Over the years numerous organizations on both sides of this issue had been designated by our shareholders to receive contributions. As a result, we regularly received some objections to the gifts designated for pro-choice operations. A few of these came from people and organizations that proceeded to boycott products

of our subsidiaries. That did not concern us. We refused all requests to limit the right of our owners to make whatever gifts they chose (as long as the recipients had 501(c)(3) status).

In 2003, however, many *independent* associates of The Pampered Chef began to feel the boycotts. This development meant that people who trusted us – but who were neither employees of ours nor had a voice in Berkshire decision-making – suffered serious losses of income.

For our shareholders, there was some modest tax efficiency in Berkshire doing the giving rather than their making their gifts directly. Additionally, the program was consistent with our "partnership" approach, the first principle set forth in our Owner's Manual. But these advantages paled when they were measured against damage done loyal associates who had with great personal effort built businesses of their own. Indeed, Charlie and I see nothing charitable in harming decent, hard-working people just so we and other shareholders can gain some minor tax efficiencies.

Berkshire now makes no contributions at the parent company level. Our various subsidiaries follow philanthropic policies consistent with their practices prior to their acquisition by Berkshire, except that any personal contributions that former owners had earlier made from their corporate pocketbook are now funded by them personally.

The Annual Meeting

Last year, I asked you to vote as to whether you wished our annual meeting to be held on Saturday or Monday. I was hoping for Monday. Saturday won by 2 to 1. It will be a while before shareholder democracy resurfaces at Berkshire.

But you have spoken, and we will hold this year's annual meeting on Saturday, May 1 at the new Qwest Center in downtown Omaha. The Qwest offers us 194,000 square feet for exhibition by our subsidiaries (up from 65,000 square feet last year) and much more seating capacity as well. The Qwest's doors will open at 7 a.m., the movie will begin at 8:30, and the meeting itself will commence at 9:30. There will be a short break at noon for food. (Sandwiches will be available at the Qwest's concession stands.) That interlude aside, Charlie and I will answer questions until 3:30. We will tell you everything we know . . . and, at least in my case, more.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. They do a terrific job for us each year, and I thank them for it.

In our usual fashion, we will run vans from the larger hotels to the meeting. Afterwards, the vans will make trips back to the hotels and to Nebraska Furniture Mart, Borsheim's and the airport. Even so, you are likely to find a car useful.

Our exhibition of Berkshire goods and services will blow you away this year. On the floor, for example, will be a 1,600 square foot Clayton home (featuring Acme brick, Shaw carpet, Johns-Manville insulation, MiTek fasteners, Carefree awnings, and outfitted with NFM furniture). You'll find it a far cry from the mobile-home stereotype of a few decades ago.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 41 of the 49 jurisdictions in which we operate. Bring the details of your existing insurance and check out whether we can save you money.

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets® available for your inspection. Stop by the NetJets booth at the Qwest to learn about viewing these planes. If you buy what we consider an appropriate number of items during the weekend, you may well need your own plane to take them home.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing, which means we will be offering our shareholders a discount that is customarily given only to employees. We initiated this special pricing at NFM seven years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $17.3 million in 2003. Every year has set a new record.

To get the discount, you must make your purchases between Thursday, April 29 and Monday, May 3 inclusive, and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. Monday through Saturday, and 10 a.m. to 6 p.m. on Sunday. On Saturday this year, from 5:30 p.m. to 8 p.m., we are having a special affair for shareholders only. I'll be there, eating barbeque and drinking Coke.

Borsheim's — the largest jewelry store in the country except for Tiffany's Manhattan store — will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, April 30. The second, the main gala, will be from 9 a.m. to 4 p.m. on Sunday, May 2. Ask Charlie to autograph your *sales ticket*.

Shareholder prices will be available Thursday through Monday, so if you wish to avoid the large crowds that will assemble on Friday evening and Sunday, come at other times and identify yourself as a shareholder. On Saturday, we will be open until 6 p.m. Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, so the more you buy, the more you save – at least that's what my wife and daughter tell me. (Both were impressed early in life by the story of the boy who, after missing a street car, walked home and proudly announced that he had saved 5¢ by doing so. His father was irate: "Why didn't you miss a cab and save 85¢?")

In the mall outside of Borsheim's, we will have Bob Hamman and Sharon Osberg, two of the world's top bridge experts, available to play with our shareholders on Sunday afternoon. Additionally, Patrick Wolff, twice U.S. chess champion, will be in the mall, taking on all comers — blindfolded! I've watched, and he doesn't peek.

Gorat's — my favorite steakhouse — will again be open exclusively for Berkshire shareholders on Sunday, May 2, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on Sunday, you must have a reservation. To make one, call 402-551-3733 on April 1 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. Flaunt your mastery of fine dining by ordering, as I do, a rare T-bone with a double order of hash browns.

We will have a special reception on Saturday afternoon from 4:00 to 5:00 for shareholders who come from outside of North America. Every year our meeting draws many people from around the globe, and Charlie and I want to be sure we personally meet those who have come so far. Any shareholder who comes from other than the U.S. or Canada will be given special credentials and instructions for attending this function.

Charlie and I have a great time at the annual meeting. And you will, too. So join us at the Qwest for our annual Woodstock for Capitalists.

Warren E. Buffett
February 27, 2004 Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7

2003	21.0	28.7	(7.7)
2004	10.5	10.9	(.4)
Average Annual Gain — 1965-2004	21.9	10.4	11.5
Overall Gain — 1964-2004	286,865	5,318	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2004 was $8.3 billion, which increased the per-share book value of both our Class A and Class B stock by 10.5%. Over the last 40 years (that is, since present management took over) book value has grown from $19 to $55,824, a rate of 21.9% compounded annually.*

It's per-share intrinsic value that counts, however, not book value. Here, the news is good: Between 1964 and 2004, Berkshire morphed from a struggling northern textile business whose intrinsic value was less than book into a diversified enterprise worth far more than book. Our 40-year gain in intrinsic value has therefore somewhat exceeded our 21.9% gain in book. (For an explanation of intrinsic value and the economic principles that guide Charlie Munger, my partner and Berkshire's vice-chairman, and me in running Berkshire, please read our Owner's Manual, beginning on page 73.)

Despite their shortcomings, yearly calculations of book value are useful at Berkshire as a slightly understated gauge for measuring the *long-term* rate of increase in our intrinsic value. The calculations are less relevant, however, than they once were in rating any single year's performance versus the S&P 500 index (a comparison we display on the facing page). Our equity holdings (including convertible preferreds) have fallen considerably as a percentage of our net worth, from an average of 114% in the 1980s, for example, to less than 50% in recent years. Therefore, yearly movements in the stock market now affect a much smaller portion of our net worth than was once the case, a fact that will normally cause us to underperform in years when stocks rise substantially and overperform in years when they fall.

However the yearly comparisons work out, Berkshire's long-term performance versus the S&P remains all-important. Our shareholders can buy the S&P through an index fund at very low cost. Unless we achieve gains in per-share intrinsic value in the future that outdo the S&P, Charlie and I will be adding nothing to what you can accomplish on your own.

Last year, Berkshire's book-value gain of 10.5% fell short of the index's 10.9% return. Our lackluster performance was not due to any stumbles by the CEOs of our operating businesses: As always, they pulled more than their share of the load. My message to them is simple: Run your business as if it were the only asset your family will own over the next hundred years. Almost invariably they do just that and, after taking care of the needs of their business, send excess cash to Omaha for me to deploy.

I didn't do that job very well last year. My hope was to make several multi-billion dollar acquisitions that would add new and significant streams of earnings to the many we already have. But I struck out. Additionally, I found very few attractive securities to buy. Berkshire therefore ended the year with $43 billion of cash equivalents, not a happy position. Charlie and I will work to translate some of this hoard into more interesting assets during 2005, though we can't promise success.

In one respect, 2004 was a remarkable year for the stock market, a fact buried in the maze of numbers on page 2. If you examine the 35 years since the 1960s ended, you will find that an investor's return, including dividends, from owning the S&P has averaged 11.2% annually (well above what we expect future returns to be). But if you look for years with returns anywhere close to that 11.2% – say, between 8% and 14% – you will find only *one* before 2004. In other words, last year's "normal" return is anything but.

*****All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Over the 35 years, American business has delivered terrific results. It should therefore have been easy for investors to earn juicy returns: All they had to do was piggyback Corporate America in a diversified, low-expense way. An index fund that they never touched would have done the job. Instead many investors have had experiences ranging from mediocre to disastrous.

There have been three primary causes: first, high costs, usually because investors traded excessively or spent far too much on investment management; second, portfolio decisions based on tips and fads rather than on thoughtful, quantified evaluation of businesses; and third, a start-and-stop approach to the market marked by untimely entries (after an advance has been long underway) and exits (after periods of stagnation or decline). Investors should remember that excitement and expenses are their enemies. And if they insist on trying to time their participation in equities, they should try to be fearful when others are greedy and greedy only when others are fearful.

Sector Results

As managers, Charlie and I want to give our owners the financial information and commentary we would wish to receive if our roles were reversed. To do this with both clarity and reasonable brevity becomes more difficult as Berkshire's scope widens. Some of our businesses have vastly different economic characteristics from others, which means that our consolidated statements, with their jumble of figures, make useful analysis almost impossible.

On the following pages, therefore, we will present some balance sheet and earnings figures from our four major categories of businesses along with commentary about each. We particularly want you to understand the limited circumstances under which we will use debt, given that we typically shun it. We will not, however, inundate you with data that has no real value in estimating Berkshire's intrinsic value. Doing so would tend to obfuscate the facts that count.

Regulated Utility Businesses

We have an 80.5% (fully diluted) interest in MidAmerican Energy Holdings, which owns a wide variety of utility operations. The largest of these are (1) Yorkshire Electricity and Northern Electric, whose 3.7 million electric customers make it the third largest distributor of electricity in the U.K.; (2) MidAmerican Energy, which serves 698,000 electric customers, primarily in Iowa; and (3) Kern River and Northern Natural pipelines, which carry 7.9% of the natural gas consumed in the U.S.

The remaining 19.5% of MidAmerican is owned by three partners of ours: Dave Sokol and Greg Abel, the brilliant managers of these businesses, and Walter Scott, a long-time friend of mine who introduced me to the company. Because MidAmerican is subject to the Public Utility Holding Company Act ("PUHCA"), Berkshire's voting interest is limited to 9.9%. Voting control rests with Walter.

Our limited voting interest forces us to account for MidAmerican in an abbreviated manner. Instead of our fully incorporating the company's assets, liabilities, revenues and expenses into Berkshire's statements, we make one-line entries only in both our balance sheet and income account. It's likely, though, that PUHCA will someday – perhaps soon – be repealed or that accounting rules will change. Berkshire's consolidated figures would then incorporate all of MidAmerican, including the substantial debt it utilizes (though this debt is not now, nor will it ever be, an obligation of Berkshire).

At yearend, $1.478 billion of MidAmerican's junior debt was payable to Berkshire. This debt has allowed acquisitions to be financed without our partners needing to increase their already substantial investments in MidAmerican. By charging 11% interest, Berkshire is compensated fairly for putting up the funds needed for purchases, while our partners are spared dilution of their equity interests. Because MidAmerican made no large acquisitions last year, it paid down $100 million of what it owes us.

MidAmerican also owns a significant non-utility business, HomeServices of America, the second largest real estate broker in the country. Unlike our utility operations, this business is highly cyclical, but nevertheless one we view enthusiastically. We have an exceptional manager, Ron Peltier, who through both his acquisition and operational skills is building a brokerage powerhouse.

HomeServices participated in $59.8 billion of transactions in 2004, a gain of $11.2 billion from 2003. About 24% of the increase came from six acquisitions made during the year. Through our 17 brokerage firms – all of which retain their local identities – we employ more than 18,000 brokers in 18 states. HomeServices is almost certain to grow substantially in the next decade as we continue to acquire leading localized operations.

Last year MidAmerican wrote off a major investment in a zinc recovery project that was initiated in 1998 and became operational in 2002. Large quantities of zinc are present in the brine produced by our California geothermal operations, and we believed we could profitably extract the metal. For many months, it appeared that commercially-viable recoveries were imminent. But in mining, just as in oil exploration, prospects have a way of "teasing" their developers, and every time one problem was solved, another popped up. In September, we threw in the towel.

Our failure here illustrates the importance of a guideline – *stay with simple propositions* – that we usually apply in investments as well as operations. If only one variable is key to a decision, and the variable has a 90% chance of going your way, the chance for a successful outcome is obviously 90%. But if ten independent variables need to break favorably for a successful result, and each has a 90% probability of success, the likelihood of having a winner is only 35%. In our zinc venture, we solved most of the problems. But one proved intractable, and that was one too many. Since a chain is no stronger than its weakest link, it makes sense to look for – if you'll excuse an oxymoron – mono-linked chains.

A breakdown of MidAmerican's results follows. In 2004, the "other" category includes a $72.2 million profit from sale of an Enron receivable that was thrown in when we purchased Northern Natural two years earlier. Walter, Dave and I, as natives of Omaha, view this unanticipated gain as war reparations – partial compensation for the loss our city suffered in 1986 when Ken Lay moved Northern to Houston, after promising to leave the company here. (For details, see Berkshire's 2002 annual report.)

Here are some key figures on MidAmerican's operations:

	Earnings (in $ millions)	
	2004	*2003*
U.K. utilities	$ 326	$ 289
Iowa utility	268	269
Pipelines	288	261
HomeServices	130	113
Other (net)	172	190
Loss from zinc project	(579)	(46)
Earnings before corporate interest and taxes	605	1,076
Interest, other than to Berkshire	(212)	(225)
Interest on Berkshire junior debt	(170)	(184)
Income tax	(53)	(251)
Net earnings	$ 170	$ 416
Earnings applicable to Berkshire*	$ 237	$ 429
Debt owed to others	10,528	10,296
Debt owed to Berkshire	1,478	1,578

*Includes interest earned by Berkshire (net of related income taxes) of $110 in 2004 and $118 in 2003.

Insurance

Since Berkshire purchased National Indemnity ("NICO") in 1967, property-casualty insurance has been our core business and the propellant of our growth. Insurance has provided a fountain of funds with which we've acquired the securities and businesses that now give us an ever-widening variety of earnings streams. So in this section, I will be spending a little time telling you how we got where we are.

The source of our insurance funds is "float," which is money that doesn't belong to us but that we temporarily hold. Most of our float arises because (1) premiums are paid upfront though the service we provide – insurance protection – is delivered over a period that usually covers a year and; (2) loss events that occur today do not always result in our immediately paying claims, because it sometimes takes many years for losses to be reported (asbestos losses would be an example), negotiated and settled. The $20 million of float that came with our 1967 purchase has now increased – both by way of internal growth and acquisitions – to $46.1 billion.

Float is wonderful – *if* it doesn't come at a high price. Its cost is determined by underwriting results, meaning how the expenses and losses we will ultimately pay compare with the premiums we have received. When an underwriting profit is achieved – as has been the case at Berkshire in about half of the 38 years we have been in the insurance business – float is better than free. In such years, we are actually paid for holding other people's money. For most insurers, however, life has been far more difficult: In aggregate, the property-casualty industry almost invariably operates at an underwriting loss. When that loss is large, float becomes expensive, sometimes devastatingly so.

Insurers have generally earned poor returns for a simple reason: They sell a commodity-like product. Policy forms are standard, and the product is available from many suppliers, some of whom are mutual companies ("owned" by policyholders rather than stockholders) with profit goals that are limited. Moreover, most insureds don't care from whom they buy. Customers by the millions say "I need some Gillette blades" or "I'll have a Coke" but we wait in vain for "I'd like a National Indemnity policy, please." Consequently, price competition in insurance is usually fierce. Think airline seats.

So, you may ask, how do Berkshire's insurance operations overcome the dismal economics of the industry and achieve some measure of enduring competitive advantage? We've attacked that problem in several ways. Let's look first at NICO's strategy.

When we purchased the company – a specialist in commercial auto and general liability insurance – it did not appear to have any attributes that would overcome the industry's chronic troubles. It was not well-known, had no informational advantage (the company has never had an actuary), was not a low-cost operator, and sold through general agents, a method many people thought outdated. Nevertheless, for almost all of the past 38 years, NICO has been a star performer. Indeed, had we not made this acquisition, Berkshire would be lucky to be worth half of what it is today.

What we've had going for us is a managerial mindset that most insurers find impossible to replicate. Take a look at the facing page. Can you imagine *any* public company embracing a business model that would lead to the decline in revenue that we experienced from 1986 through 1999? That colossal slide, it should be emphasized, did not occur because business was unobtainable. Many billions of premium dollars were readily available to NICO had we only been willing to cut prices. But we instead consistently priced to make a profit, not to match our most optimistic competitor. We never left customers – but they left us.

Most American businesses harbor an "institutional imperative" that rejects extended decreases in volume. What CEO wants to report to his shareholders that not only did business contract last year but that it will continue to drop? In insurance, the urge to keep writing business is also intensified because the consequences of foolishly-priced policies may not become apparent for some time. If an insurer is optimistic in its reserving, reported earnings will be overstated, and years may pass before true loss costs are revealed (a form of self-deception that nearly destroyed GEICO in the early 1970s).

Portrait of a Disciplined Underwriter

National Indemnity Company

Year	Written Premium (In $ millions)	No. of Employees at Year-End	Ratio of Operating Expenses to Written Premium	Underwriting Profit (Loss) as a Percentage of Premiums (Calculated as of year end 2004)*
1980	$79.6	372	32.3%	8.2%
1981	59.9	353	36.1%	(.8%)
1982	52.5	323	36.7%	(15.3%)
1983	58.2	308	35.6%	(18.7%)
1984	62.2	342	35.5%	(17.0%)
1985	160.7	380	28.0%	1.9%
1986	366.2	403	25.9%	30.7%

2004	605.6	340	22.5%	5.1%

*It takes a long time to learn the true profitability of any given year. First, many claims are received after the end of the year, and we must estimate how many of these there will be and what they will cost. (In insurance jargon, these claims are termed IBNR – incurred but not reported.) Second, claims often take years, or even decades, to settle, which means there can be many surprises along the way.

For these reasons, the results in this column simply represent our best estimate at the end of 2004 as to how we have done in prior years. Profit margins for the years through 1999 are probably close to correct because these years are "mature," in the sense that they have few claims still outstanding. The more recent the year, the more guesswork is involved. In particular, the results shown for 2003 and 2004 are apt to change significantly.

Finally, there is a fear factor at work, in that a shrinking business usually leads to layoffs. To avoid pink slips, employees will rationalize inadequate pricing, telling themselves that poorly-priced business must be tolerated in order to keep the organization intact and the distribution system happy. If this course isn't followed, these employees will argue, the company will not participate in the recovery that they invariably feel is just around the corner.

To combat employees' natural tendency to save their own skins, we have always promised NICO's workforce that *no one* will be fired because of declining volume, however severe the contraction. (This is not Donald Trump's sort of place.) NICO is not labor-intensive, and, as the table suggests, can live with excess overhead. It can't live, however, with underpriced business and the breakdown in underwriting discipline that accompanies it. An insurance organization that doesn't care deeply about underwriting at a profit *this* year is unlikely to care *next* year either.

Naturally, a business that follows a no-layoff policy must be especially careful to avoid overstaffing when times are good. Thirty years ago Tom Murphy, then CEO of Cap Cities, drove this point home to me with a hypothetical tale about an employee who asked his boss for permission to hire an assistant. The employee assumed that adding $20,000 to the annual payroll would be inconsequential. But his boss told him the proposal should be evaluated as a $3 million decision, given that an additional person would probably cost at least that amount over his lifetime, factoring in raises, benefits and other expenses (more people, more toilet paper). And unless the company fell on very hard times, the employee added would be unlikely to be dismissed, however marginal his contribution to the business.

It takes real fortitude – embedded deep within a company's culture – to operate as NICO does. Anyone examining the table can scan the years from 1986 to 1999 quickly. But living day after day with dwindling volume – while competitors are boasting of growth and reaping Wall Street's applause – is an experience few managers can tolerate. NICO, however, has had four CEOs since its formation in 1940 and *none* have bent. (It should be noted that only one of the four graduated from college. Our experience tells us that extraordinary business ability is largely innate.)

The current managerial star – make that superstar – at NICO is Don Wurster (yes, he's "the graduate"), who has been running things since 1989. His slugging percentage is right up there with Barry Bonds' because, like Barry, Don will accept a walk rather than swing at a bad pitch. Don has now amassed $950 million of float at NICO that over time is almost certain to be proved the negative-cost kind. Because insurance prices are falling, Don's volume will soon decline very significantly and, as it does, Charlie and I will applaud him ever more loudly.

* * * * * * * * * * * *

Another way to prosper in a commodity-type business is to be the low-cost operator. Among auto insurers operating on a broad scale, GEICO holds that cherished title. For NICO, as we have seen, an ebb-and-flow business model makes sense. But a company holding a low-cost advantage must pursue an unrelenting foot-to-the-floor strategy. And that's just what we do at GEICO.

A century ago, when autos first appeared, the property-casualty industry operated as a cartel. The major companies, most of which were based in the Northeast, established "bureau" rates and that was it. No one cut prices to attract business. Instead, insurers competed for strong, well-regarded agents, a focus that produced high commissions for agents and high prices for consumers.

In 1922, State Farm was formed by George Mecherle, a farmer from Merna, Illinois, who aimed to take advantage of the pricing umbrella maintained by the high-cost giants of the industry. State Farm employed a "captive" agency force, a system keeping its acquisition costs lower than those incurred by the bureau insurers (whose "independent" agents successfully played off one company against another). With its low-cost structure, State Farm eventually captured about 25% of the personal lines (auto and homeowners) business, far outdistancing its once-mighty competitors. Allstate, formed in 1931, put a similar distribution system into place and soon became the runner-up in personal lines to State Farm. Capitalism had worked its magic, and these low-cost operations looked unstoppable.

But a man named Leo Goodwin had an idea for an even more efficient auto insurer and, with a skimpy $200,000, started GEICO in 1936. Goodwin's plan was to eliminate the agent entirely and to deal instead directly with the auto owner. Why, he asked himself, should there be any unnecessary and expensive links in the distribution mechanism when the product, auto insurance, was both mandatory and costly. Purchasers of business insurance, he reasoned, might well require professional advice, but most consumers knew what they needed in an auto policy. That was a powerful insight.

Originally, GEICO mailed its low-cost message to a limited audience of government employees. Later, it widened its horizons and shifted its marketing emphasis to the phone, working inquiries that came from broadcast and print advertising. And today the Internet is coming on strong.

Between 1936 and 1975, GEICO grew from a standing start to a 4% market share, becoming the country's fourth largest auto insurer. During most of this period, the company was superbly managed, achieving both excellent volume gains and high profits. It looked unstoppable. But after my friend and hero Lorimer Davidson retired as CEO in 1970, his successors soon made a huge mistake by under-reserving for losses. This produced faulty cost information, which in turn produced inadequate pricing. By 1976, GEICO was on the brink of failure.

Jack Byrne then joined GEICO as CEO and, almost single-handedly, saved the company by heroic efforts that included major price increases. Though GEICO's survival required these, policyholders fled the company, and by 1980 its market share had fallen to 1.8%. Subsequently, the company embarked on some unwise diversification moves. This shift of emphasis away from its extraordinary core business stunted GEICO's growth, and by 1993 its market share had grown only fractionally, to 1.9%. Then Tony Nicely took charge.

And what a difference that's made: In 2005 GEICO will probably secure a 6% market share. Better yet, Tony has matched growth with profitability. Indeed, GEICO delivers all of its constituents major benefits: In 2004 its customers saved $1 billion or so compared to what they would otherwise have paid for coverage, its associates earned a $191 million profit-sharing bonus that averaged 24.3% of salary, and its owner – that's us – enjoyed excellent financial returns.

There's more good news. When Jack Byrne was rescuing the company in 1976, New Jersey refused to grant him the rates he needed to operate profitably. He therefore promptly – and properly – withdrew from the state. Subsequently, GEICO avoided both New Jersey and Massachusetts, recognizing them as two jurisdictions in which insurers were destined to struggle.

In 2003, however, New Jersey took a new look at its chronic auto-insurance problems and enacted legislation that would curb fraud and allow insurers a fair playing field. Even so, one might have expected the state's bureaucracy to make change slow and difficult.

But just the opposite occurred. Holly Bakke, the New Jersey insurance commissioner, who would be a success in *any* line of work, was determined to turn the law's intent into reality. With her staff's cooperation, GEICO ironed out the details for re-entering the state and was licensed last August. Since then, we've received a response from New Jersey drivers that is multiples of my expectations.

We are now serving 140,000 policyholders – about 4% of the New Jersey market – and saving them substantial sums (as we do drivers everywhere). Word-of-mouth recommendations within the state are causing inquiries to pour in. And once we hear from a New Jersey prospect, our closure rate – the percentage of policies issued to inquiries received – is far higher in the state than it is nationally.

We make no claim, of course, that we can save *everyone* money. Some companies, using rating systems that are different from ours, will offer certain classes of drivers a lower rate than we do. But we believe GEICO offers the lowest price more often than any other national company that serves all segments of the public. In addition, in most states, including New Jersey, Berkshire shareholders receive an 8% discount. So gamble fifteen minutes of your time and go to GEICO.com – or call 800-847-7536 – to see

whether you can save big money (which you might want to use, of course, to buy other Berkshire products).

* * * * * * * * * * * *

Reinsurance – insurance sold to other insurers who wish to lay off part of the risks they have assumed – should *not* be a commodity product. At bottom, any insurance policy is simply a promise, and as everyone knows, promises vary enormously in their quality.

At the primary insurance level, nevertheless, just who makes the promise is often of minor importance. In personal-lines insurance, for example, states levy assessments on solvent companies to pay the policyholders of companies that go broke. In the business-insurance field, the same arrangement applies to workers' compensation policies. "Protected" policies of these types account for about 60% of the property-casualty industry's volume. Prudently-run insurers are irritated by the need to subsidize poor or reckless management elsewhere, but that's the way it is.

Other forms of business insurance at the primary level involve promises that carry greater risks for the insured. When Reliance Insurance and Home Insurance were run into the ground, for example, their promises proved to be worthless. Consequently, many holders of their business policies (other than those covering workers' compensation) suffered painful losses.

The solvency risk in primary policies, however, pales in comparison to that lurking in reinsurance policies. When a reinsurer goes broke, staggering losses almost always strike the primary companies it has dealt with. This risk is far from minor: GEICO has suffered tens of millions in losses from its careless selection of reinsurers in the early 1980s.

Were a true mega-catastrophe to occur in the next decade or two – and that's a real possibility – some reinsurers would not survive. The largest insured loss to date is the World Trade Center disaster, which cost the insurance industry an estimated $35 billion. Hurricane Andrew cost insurers about $15.5 billion in 1992 (though that loss would be far higher in today's dollars). Both events rocked the insurance and reinsurance world. But a $100 billion event, or even a larger catastrophe, remains a possibility if either a particularly severe earthquake or hurricane hits just the wrong place. Four significant hurricanes struck Florida during 2004, causing an aggregate of $25 billion or so in insured losses. Two of these – Charley and Ivan – could have done at least three times the damage they did had they entered the U.S. not far from their actual landing points.

Many insurers regard a $100 billion industry loss as "unthinkable" and won't even plan for it. But at Berkshire, we are fully prepared. Our share of the loss would probably be 3% to 5%, and earnings from our investments and other businesses would comfortably exceed that cost. When "the day after" arrives, Berkshire's checks will clear.

Though the hurricanes hit us with a $1.25 billion loss, our reinsurance operations did well last year. At General Re, Joe Brandon has restored a long-admired culture of underwriting discipline that, for a time, had lost its way. The excellent results he realized in 2004 on current business, however, were offset by adverse developments from the years before he took the helm. At NICO's reinsurance operation, Ajit Jain continues to successfully underwrite huge risks that no other reinsurer is willing or able to accept. Ajit's value to Berkshire is enormous.

* * * * * * * * * * * *

Our insurance managers, maximizing the competitive strengths I've mentioned in this section, again delivered first-class underwriting results last year. As a consequence, our float was better than costless. Here's the scorecard:

	(in $ millions)		
	Underwriting Profit	*Yearend Float*	
Insurance Operations	*2004*	*2004*	*2003*
General Re	$ 3	$23,120	$23,654
B-H Reinsurance	417	15,278	13,948
GEICO	970	5,960	5,287
Other Primary*	161	1,736	1,331
Total	$1,551	$46,094	$44,220

*Includes, in addition to National Indemnity, a variety of other exceptional insurance businesses, run by Rod Eldred, John Kizer, Tom Nerney and Don Towle.

Berkshire's float increased $1.9 billion in 2004, even though a few insureds opted to commute (that is, unwind) certain reinsurance contracts. We agree to such commutations only when we believe the economics are favorable to us (after giving due weight to what we might earn in the future on the money we are returning).

To summarize, last year we were paid more than $1.5 billion to hold an average of about $45.2 billion. In 2005 pricing will be less attractive than it has been. Nevertheless, absent a mega-catastrophe, we have a decent chance of achieving no-cost float again this year.

Finance and Finance Products

Last year in this section we discussed a potpourri of activities. In this report, we'll skip over several that are now of lesser importance: Berkadia is down to tag ends; Value Capital has added other investors, negating our expectation that we would need to consolidate its financials into ours; and the trading operation that I run continues to shrink.

- Both of Berkshire's leasing operations rebounded last year. At CORT (office furniture), earnings remain inadequate, but are trending upward. XTRA disposed of its container and intermodal businesses in order to concentrate on trailer leasing, long its strong suit. Overhead has been reduced, asset utilization is up and decent profits are now being achieved under Bill Franz, the company's new CEO.

- The wind-down of Gen Re Securities continues. We decided to exit this derivative operation three years ago, but getting out is easier said than done. Though derivative instruments are purported to be highly liquid – and though we have had the benefit of a benign market while liquidating ours – we still had 2,890 contracts outstanding at yearend, down from 23,218 at the peak. Like Hell, derivative trading is easy to enter but difficult to leave. (Other similarities come to mind as well.)

  Gen Re's derivative contracts have always been required to be marked to market, and I believe the company's management conscientiously tried to make realistic "marks." The market prices of derivatives, however, can be very fuzzy in a world in which settlement of a transaction is sometimes decades away and often involves multiple variables as well. In the interim the marks influence the managerial and trading bonuses that are paid annually. It's small wonder that phantom profits are often recorded.

  Investors should understand that in all types of financial institutions, rapid growth sometimes masks major underlying problems (and occasionally fraud). The real test of the earning power of a derivatives operation is what it achieves after operating for an extended period in a no-growth mode. You only learn who has been swimming naked when the tide goes out.

- After 40 years, we've finally generated a little synergy at Berkshire: Clayton Homes is doing well and that's in part due to its association with Berkshire. The manufactured home industry

continues to reside in the intensive care unit of Corporate America, having sold less than 135,000 new homes last year, about the same as in 2003. Volume in these years was the lowest since 1962, and it was also only about 40% of annual sales during the years 1995-99. That era, characterized by irresponsible financing and naïve funders, was a fool's paradise for the industry.

Because one major lender after another has fled the field, financing continues to bedevil manufacturers, retailers and purchasers of manufactured homes. Here Berkshire's support has proven valuable to Clayton. We stand ready to fund whatever makes sense, and last year Clayton's management found much that qualified.

As we explained in our 2003 report, we believe in using borrowed money to support profitable, interest-bearing receivables. At the beginning of last year, we had borrowed $2 billion to relend to Clayton (at a one percentage-point markup) and by January 2005 the total was $7.35 billion. Most of the dollars added were borrowed by us on January 4, 2005, to finance a seasoned portfolio that Clayton purchased on December 30, 2004 from a bank exiting the business.

We now have two additional portfolio purchases in the works, totaling about $1.6 billion, but it's quite unlikely that we will secure others of any significance. Therefore, Clayton's receivables (in which originations will roughly offset payoffs) will probably hover around $9 billion for some time and should deliver steady earnings. This pattern will be far different from that of the past, in which Clayton, like all major players in its industry, "securitized" its receivables, causing earnings to be front-ended. In the last two years, the securitization market has dried up. The limited funds available today come only at higher cost and with harsh terms. Had Clayton remained independent in this period, it would have had mediocre earnings as it struggled with financing.

In April, Clayton completed the acquisition of Oakwood Homes and is now the industry's largest producer and retailer of manufactured homes. We love putting more assets in the hands of Kevin Clayton, the company's CEO. He is a prototype Berkshire manager. Today, Clayton has 11,837 employees, up from 7,136 when we purchased it, and Charlie and I are pleased that Berkshire has been useful in facilitating this growth.

For simplicity's sake, we include all of Clayton's earnings in this sector, though a sizable portion of these are derived from areas other than consumer finance.

	$23,636		$23,636

Earnings Statement (in $ millions)

	2004	*2003*
Revenues	$44,142	$32,106
Operating expenses (including depreciation of $676 in 2004 and $605 in 2003)	41,604	29,885
Interest expense (net)	57	64
Pre-tax earnings	2,481	2,157
Income taxes	941	813
Net income	$ 1,540	$ 1,344

This eclectic group, which sells products ranging from Dilly Bars to fractional interests in Boeing 737s, earned a very respectable 21.7% on average tangible net worth last year, compared to 20.7% in 2003. It's noteworthy that these operations used only minor financial leverage in achieving these returns. Clearly, we own some very good businesses. We purchased many of them, however, at substantial premiums to net worth – a matter that is reflected in the goodwill item shown on the balance sheet – and that fact reduces the earnings on our average *carrying* value to 9.9%.

Here are the pre-tax earnings for the larger categories or units.

	Pre-Tax Earnings (in $ millions)	
	2004	*2003*
Building Products	$ 643	$ 559
Shaw Industries	466	436
Apparel & Footwear	325	289
Retailing of Jewelry, Home Furnishings and Candy	215	224
Flight Services	191	72
McLane	228	150*
Other businesses	413	427
	$2,481	$2,157

* From date of acquisition, May 23, 2003.

- In the building-products sector and at Shaw, we've experienced staggering cost increases for both raw-materials and energy. By December, for example, steel costs at MiTek (whose primary business is connectors for roof trusses) were running 100% over a year earlier. And MiTek uses 665 million pounds of steel every year. Nevertheless, the company continues to be an outstanding performer.

Since we purchased MiTek in 2001, Gene Toombs, its CEO, has made some brilliant "bolt-on" acquisitions and is on his way to creating a mini-Berkshire.

Shaw fielded a barrage of price increases in its main fiber materials during the year, a hit that added more than $300 million to its costs. (When you walk on carpet you are, in effect, stepping on processed oil.) Though we followed these hikes in costs with price increases of our own, there was an inevitable lag. Therefore, margins narrowed as the year progressed and remain under pressure today. Despite these roadblocks, Shaw, led by Bob Shaw and Julian Saul, earned an outstanding 25.6% on tangible equity in 2004. The company is a powerhouse and has a bright future.

- In apparel, Fruit of the Loom increased unit sales by 10 million dozen, or 14%, with shipments of intimate apparel for women and girls growing by 31%. Charlie, who is far more knowledgeable than I am on this subject, assures me that women are *not* wearing more underwear. With this expert input, I can only conclude that our market share in the women's category must be growing rapidly. Thanks to John Holland, Fruit is on the move.

  A smaller operation, Garan, also had an excellent year. Led by Seymour Lichtenstein and Jerry Kamiel, this company manufactures the popular Garanimals line for children. Next time you are in a Wal-Mart, check out this imaginative product.

- Among our retailers, Ben Bridge (jewelry) and R. C. Willey (home furnishings) were particular standouts last year.

  At Ben Bridge same-store sales grew 11.4%, the best gain among the publicly-held jewelers whose reports I have seen. Additionally, the company's profit margin widened. Last year was not a fluke: During the past decade, the same-store sales gains of the company have averaged 8.8%.

  Ed and Jon Bridge are fourth-generation managers and run the business exactly as if it were their own – which it is in every respect except for Berkshire's name on the stock certificates. The Bridges have expanded successfully by securing the right locations and, more importantly, by staffing these stores with enthusiastic and knowledgeable associates. We will move into Minneapolis-St. Paul this year.

  At Utah-based R. C. Willey, the gains from expansion have been even more dramatic, with 41.9% of 2004 sales coming from out-of-state stores that didn't exist before 1999. The company also improved its profit margin in 2004, propelled by its two new stores in Las Vegas.

  I would like to tell you that these stores were my idea. In truth, I thought they were mistakes. I knew, of course, how brilliantly Bill Child had run the R. C. Willey operation in Utah, where its market share had long been huge. But I felt our closed-on-Sunday policy would prove disastrous away from home. Even our first out-of-state store in Boise, which was highly successful, left me unconvinced. I kept asking whether Las Vegas residents, conditioned to seven-day-a-week retailers, would adjust to us. Our first Las Vegas store, opened in 2001, answered this question in a resounding manner, immediately becoming our number one unit.

  Bill and Scott Hymas, his successor as CEO, then proposed a second Las Vegas store, only about 20 minutes away. I felt this expansion would cannibalize the first unit, adding significant costs but only modest sales. The result? Each store is now doing about 26% more volume than any other store in the chain and is consistently showing large year-over-year gains.

  R. C. Willey will soon open in Reno. Before making this commitment, Bill and Scott again asked for my advice. Initially, I was pretty puffed up about the fact that they were consulting me. But then it dawned on me that the opinion of someone who is *always* wrong has its own special utility to decision-makers.

- Earnings improved in flight services. At FlightSafety, the world's leader in pilot training, profits rose as corporate aviation rebounded and our business with regional airlines increased. We now operate 283 simulators with an original cost of $1.2 billion. Pilots are trained one at a time on this expensive equipment. This means that as much as $3.50 of capital investment is required to produce $1 of annual revenue. With this level of capital intensity, FlightSafety requires very high operating margins in order to obtain reasonable returns on capital, which means that utilization rates are all-important. Last year, FlightSafety's return on tangible equity improved to 15.1% from 8.4% in 2003.

  In another 2004 event, Al Ueltschi, who founded FlightSafety in 1951 with $10,000, turned over the CEO position to Bruce Whitman, a 43-year veteran at the company. (But Al's not going anywhere; I won't let him.) Bruce shares Al's conviction that flying an aircraft is a privilege to be extended only to people who regularly receive the highest quality of training and are undeniably competent. A few years ago, Charlie was asked to intervene with Al on behalf of a tycoon friend whom FlightSafety had flunked. Al's reply to Charlie: "Tell your pal he belongs in the back of the plane, not the cockpit."

  FlightSafety's number one customer is NetJets, our aircraft fractional-ownership subsidiary. Its 2,100 pilots spend an average of 18 days a year in training. Additionally, these pilots fly only one aircraft type whereas many flight operations juggle pilots among several types. NetJets' high standards on both fronts are two of the reasons I signed up with the company years before Berkshire bought it.

  Fully as important in my decisions to both use and buy NetJets, however, was the fact that the company was managed by Rich Santulli, the creator of the fractional-ownership industry and a fanatic about safety and service. I viewed the selection of a flight provider as akin to picking a brain surgeon: you simply want the best. (Let someone else experiment with the low bidder.)

  Last year NetJets again gained about 70% of the net new business (measured by dollar value) going to the four companies that dominate the industry. A portion of our growth came from the 25-hour card offered by Marquis Jet Partners. Marquis is not owned by NetJets, but is instead a customer that repackages the purchases it makes from us into smaller packages that it sells through its card. Marquis deals exclusively with NetJets, utilizing the power of our reputation in its marketing.

  Our U.S. contracts, including Marquis customers, grew from 3,877 to 4,967 in 2004 (versus approximately 1,200 contracts when Berkshire bought NetJets in 1998). Some clients (including me) enter into multiple contracts because they wish to use more than one type of aircraft, selecting for any given trip whichever type best fits the mission at hand.

  NetJets earned a modest amount in the U.S. last year. But what we earned domestically was largely offset by losses in Europe. We are now, however, generating real momentum abroad. Contracts (including 25-hour cards that we ourselves market in Europe) increased from 364 to 693 during the year. We will again have a very significant European loss in 2005, but domestic earnings will likely put us in the black overall.

  Europe has been expensive for NetJets – far more expensive than I anticipated – but it is essential to building a flight operation that will forever be in a class by itself. Our U.S. owners already want a quality service wherever they travel and their wish for flight hours abroad is certain to grow dramatically in the decades ahead. Last year, U.S. owners made 2,003 flights in Europe, up 22% from the previous year and 137% from 2000. Just as important, our European owners made 1,067 flights in the U.S., up 65% from 2003 and 239% from 2000.

Investments

We show below our common stock investments. Those that had a market value of more than $600 million at the end of 2004 are itemized.

			12/31/04	
Shares	*Company*	*Percentage of Company Owned*	*Cost**	*Market*
			(in $ millions)	
151,610,700	American Express Company	12.1	$1,470	$ 8,546
200,000,000	The Coca-Cola Company	8.3	1,299	8,328
96,000,000	The Gillette Company	9.7	600	4,299
14,350,600	H&R Block, Inc.	8.7	223	703
6,708,760	M&T Bank Corporation	5.8	103	723
24,000,000	Moody's Corporation	16.2	499	2,084

*This is our actual purchase price and also our tax basis; GAAP "cost" differs in a few cases because of write-ups or write-downs that have been required.

Some people may look at this table and view it as a list of stocks to be bought and sold based upon chart patterns, brokers' opinions, or estimates of near-term earnings. Charlie and I ignore such distractions and instead view our holdings as fractional ownerships in businesses. This is an important distinction. Indeed, this thinking has been the cornerstone of my investment behavior since I was 19. At that time I read Ben Graham's *The Intelligent Investor*, and the scales fell from my eyes. (Previously, I had been entranced by the stock market, but didn't have a clue about how to invest.)

Let's look at how the *businesses* of our "Big Four" – American Express, Coca-Cola, Gillette and Wells Fargo – have fared since we bought into these companies. As the table shows, we invested $3.83 billion in the four, by way of multiple transactions between May 1988 and October 2003. On a composite basis, our dollar-weighted purchase date is July 1992. By yearend 2004, therefore, we had held these "business interests," on a weighted basis, about 12½ years.

In 2004, Berkshire's share of the group's earnings amounted to $1.2 billion. These earnings might legitimately be considered "normal." True, they were swelled because Gillette and Wells Fargo omitted option costs in their presentation of earnings; but on the other hand they were reduced because Coke had a non-recurring write-off.

Our share of the earnings of these four companies has grown almost every year, and now amounts to about 31.3% of our cost. Their cash distributions to us have also grown consistently, totaling $434 million in 2004, or about 11.3% of cost. All in all, the Big Four have delivered us a satisfactory, though far from spectacular, business result.

That's true as well of our experience in the market with the group. Since our original purchases, valuation gains have somewhat exceeded earnings growth because price/earnings ratios have increased. On a year-to-year basis, however, the business and market performances have often diverged, sometimes to an extraordinary degree. During The Great Bubble, market-value gains far outstripped the performance of the businesses. In the aftermath of the Bubble, the reverse was true.

Clearly, Berkshire's results would have been far better if I had caught this swing of the pendulum. That may seem easy to do when one looks through an always-clean, rear-view mirror. Unfortunately, however, it's the windshield through which investors must peer, and that glass is invariably fogged. Our huge positions add to the difficulty of our nimbly dancing in and out of holdings as valuations swing.

Nevertheless, I can properly be criticized for merely clucking about nose-bleed valuations during the Bubble rather than acting on my views. Though I said at the time that certain of the stocks we held were priced ahead of themselves, I underestimated just how severe the overvaluation was. I talked when I should have walked.

What Charlie and I would like is a little action now. We don't enjoy sitting on $43 billion of cash equivalents that are earning paltry returns. Instead, we yearn to buy more fractional interests similar to those we now own or – better still – more large businesses outright. We will do either, however, only when purchases can be made at prices that offer us the prospect of a reasonable return on our investment.

* * * * * * * * * * * *

We've repeatedly emphasized that the "realized" gains that we report quarterly or annually are meaningless for analytical purposes. We have a huge amount of unrealized gains on our books, and our thinking about when, and if, to cash them depends not at all on a desire to report earnings at one specific time or another. A further complication in our reported gains occurs because GAAP requires that foreign exchange contracts be marked to market, a stipulation that causes unrealized gains or losses in these holdings to flow through our published earnings as if we had sold our positions.

Despite the problems enumerated, you may be interested in a breakdown of the gains we reported in 2003 and 2004. The data reflect actual sales except in the case of currency gains, which are a combination of sales and marks to market.

Category	*Pre-Tax Gain (in $ millions)*	
	2004	*2003*
Common Stocks	$ 870	$ 448
U.S. Government Bonds	104	1,485
Junk Bonds	730	1,138
Foreign Exchange Contracts	1,839	825
Other	(47)	233
Total	$3,496	$4,129

The junk bond profits include a foreign exchange component. When we bought these bonds in 2001 and 2002, we focused first, of course, on the credit quality of the issuers, all of which were American corporations. Some of these companies, however, had issued bonds denominated in foreign currencies. Because of our views on the dollar, we favored these for purchase when they were available.

As an example, we bought €254 million of Level 3 bonds (10 ¾% of 2008) in 2001 at 51.7% of par, and sold these at 85% of par in December 2004. This issue was traded in Euros that cost us 88¢ at the time of purchase but that brought $1.29 when we sold. Thus, of our $163 million overall gain, about $85 million came from the market's revised opinion about Level 3's credit quality, with the remaining $78 million resulting from the appreciation of the Euro. (In addition, we received cash interest during our holding period that amounted to about 25% annually on our dollar cost.)

* * * * * * * * * * * *

The media continue to report that "Buffett buys" this or that stock. Statements like these are almost always based on filings Berkshire makes with the SEC and are therefore wrong. As I've said before, the stories should say "*Berkshire* buys."

Portrait of a Disciplined Investor

Lou Simpson

Year	*Return from GEICO Equities*	*S&P Return*	*Relative Results*
1980	23.7%	32.3%	(8.6%)

2004	16.9%	10.9%	6.0%
Average Annual Gain 1980-2004	20.3%	13.5%	6.8%

Even then, it is typically not I who make the buying decisions. Lou Simpson manages about $2½ billion of equities that are held by GEICO, and it is his transactions that Berkshire is usually reporting. Customarily his purchases are in the $200-$300 million range and are in companies that are smaller than the ones I focus on. Take a look at the facing page to see why Lou is a cinch to be inducted into the investment Hall of Fame.

You may be surprised to learn that Lou does not necessarily inform me about what he is doing. When Charlie and I assign responsibility, we truly hand over the baton – and we give it to Lou just as we do to our operating managers. Therefore, I typically learn of Lou's transactions about ten days after the end of each month. Sometimes, it should be added, I silently disagree with his decisions. But he's usually right.

Foreign Currencies

Berkshire owned about $21.4 billion of foreign exchange contracts at yearend, spread among 12 currencies. As I mentioned last year, holdings of this kind are a decided change for us. Before March 2002, neither Berkshire nor I had *ever* traded in currencies. But the evidence grows that our trade policies will put unremitting pressure on the dollar for many years to come – so since 2002 we've heeded that warning in setting our investment course. (As W.C. Fields once said when asked for a handout: "Sorry, son, all my money's tied up in currency.")

Be clear on one point: In no way does our thinking about currencies rest on doubts about America. We live in an extraordinarily rich country, the product of a system that values market economics, the rule of law and equality of opportunity. Our economy is far and away the strongest in the world and will continue to be. We are lucky to live here.

But as I argued in a November 10, 2003 article in *Fortune*, (available at berkshirehathaway.com), our country's trade practices are weighing down the dollar. The decline in its value has already been substantial, but is nevertheless likely to continue. Without policy changes, currency markets could even become disorderly and generate spillover effects, both political and financial. No one knows whether these problems will materialize. But such a scenario is a far-from-remote possibility that policymakers should be considering *now*. Their bent, however, is to lean toward not-so-benign neglect: A 318-page Congressional study of the consequences of unremitting trade deficits was published in November 2000 and has been gathering dust ever since. The study was ordered after the deficit hit a then-alarming $263 billion in 1999; by last year it had risen to $618 billion.

Charlie and I, it should be emphasized, believe that true trade – that is, the exchange of goods and services with other countries – is enormously beneficial for both us and them. Last year we had $1.15 trillion of such honest-to-God trade and the more of this, the better. But, as noted, our country also purchased an additional $618 billion in goods and services from the rest of the world that was unreciprocated. That is a staggering figure and one that has important consequences.

The balancing item to this one-way pseudo-trade — in economics there is always an offset — is a transfer of wealth from the U.S. to the rest of the world. The transfer may materialize in the form of IOUs our private or governmental institutions give to foreigners, or by way of their assuming ownership of our assets, such as stocks and real estate. In either case, Americans end up owning a reduced portion of our country while non-Americans own a greater part. This force-feeding of American wealth to the rest of the world is now proceeding at the rate of $1.8 billion daily, an increase of 20% since I wrote you last year. Consequently, other countries and their citizens now own a net of about $3 trillion of the U.S. A decade ago their net ownership was negligible.

The mention of trillions numbs most brains. A further source of confusion is that the current account deficit (the sum of three items, the most important by far being the trade deficit) and our national budget deficit are often lumped as "twins." They are anything but. They have different causes and different consequences.

A budget deficit in no way reduces the portion of the national pie that goes to Americans. As long as other countries and their citizens have no net ownership of the U.S., 100% of our country's output belongs to our citizens under *any* budget scenario, even one involving a huge deficit.

As a rich "family" awash in goods, Americans will argue through their legislators as to how government should redistribute the national output – that is who pays taxes and who receives governmental benefits. If "entitlement" promises from an earlier day have to be reexamined, "family members" will angrily debate among themselves as to who feels the pain. Maybe taxes will go up; maybe promises will be modified; maybe more internal debt will be issued. But when the fight is finished, *all* of the family's huge pie remains available for its members, however it is divided. No slice must be sent abroad.

Large and persisting current account deficits produce an entirely different result. As time passes, and as claims against us grow, we own less and less of what we produce. In effect, the rest of the world enjoys an ever-growing royalty on American output. Here, we are like a family that consistently overspends its income. As time passes, the family finds that it is working more and more for the "finance company" and less for itself.

Should we continue to run current account deficits comparable to those now prevailing**,** the net ownership of the U.S. by other countries and their citizens a decade from now will amount to roughly $11 trillion. And, if foreign investors were to earn only 5% on that net holding, we would need to send a net of $.55 trillion of goods and services abroad *every year* merely to service the U.S. investments then held by foreigners. At that date, a decade out, our GDP would probably total about $18 trillion (assuming low inflation, which is far from a sure thing). Therefore, our U.S. "family" would then be delivering 3% of its annual output to the rest of the world simply as tribute for the overindulgences of the past. In this case, unlike that involving budget deficits, the sons would truly pay for the sins of their fathers.

This annual royalty paid the world – which would not disappear unless the U.S. massively underconsumed and began to run consistent and large trade surpluses – would undoubtedly produce significant political unrest in the U.S. Americans would still be living very well, indeed better than now because of the growth in our economy. But they would chafe at the idea of perpetually paying tribute to their creditors and owners abroad. A country that is now aspiring to an "Ownership Society" will not find happiness in – and I'll use hyperbole here for emphasis – a "Sharecropper's Society." But that's precisely where our trade policies, supported by Republicans and Democrats alike, are taking us.

Many prominent U.S. financial figures, both in and out of government, have stated that our current-account deficits cannot persist. For instance, the minutes of the Federal Reserve Open Market Committee of June 29-30, 2004 say: "The staff noted that outsized external deficits could not be sustained indefinitely." But, despite the constant handwringing by luminaries, they offer no substantive suggestions to tame the burgeoning imbalance.

In the article I wrote for *Fortune* 16 months ago, I warned that "a gently declining dollar would not provide the answer." And so far it hasn't. Yet policymakers continue to hope for a "soft landing," meanwhile counseling other countries to stimulate (read "inflate") their economies and Americans to save more. In my view these admonitions miss the mark: There are deep-rooted structural problems that will cause America to continue to run a huge current-account deficit unless trade policies either change materially or the dollar declines by a degree that could prove unsettling to financial markets.

Proponents of the trade status quo are fond of quoting Adam Smith: "What is prudence in the conduct of every family can scarce be folly in that of a great kingdom. If a foreign country can supply us with a commodity cheaper than we ourselves can make it, better buy it of them with some part of the produce of our own industry, employed in a way in which we have some advantage."

I agree. Note, however, that Mr. Smith's statement refers to trade of *product* for product, not of *wealth* for product as our country is doing to the tune of $.6 trillion annually. Moreover, I am sure that he would never have suggested that "prudence" consisted of his "family" selling off part of its farm every day

in order to finance its overconsumption. Yet that is just what the "great kingdom" called the United States is doing.

If the U.S. was running a $.6 trillion current-account *surplus*, commentators worldwide would violently condemn our policy, viewing it as an extreme form of "mercantilism" – a long-discredited economic strategy under which countries fostered exports, discouraged imports, and piled up treasure. I would condemn such a policy as well. But, in effect if not in intent, the rest of the world is practicing mercantilism in respect to the U.S., an act made possible by our vast store of assets and our pristine credit history. Indeed, the world would never let any other country use a credit card denominated in its own currency to the insatiable extent we are employing ours. Presently, most foreign investors are sanguine: they may view us as spending junkies, but they know we are *rich* junkies as well.

Our spendthrift behavior won't, however, be tolerated indefinitely. And though it's impossible to forecast just when and how the trade problem will be resolved, it's improbable that the resolution will foster an *increase* in the value of our currency relative to that of our trading partners.

We hope the U.S. adopts policies that will quickly and substantially reduce the current-account deficit. True, a prompt solution would likely cause Berkshire to record losses on its foreign-exchange contracts. But Berkshire's resources remain heavily concentrated in dollar-based assets, and both a strong dollar and a low-inflation environment are very much in our interest.

If you wish to keep abreast of trade and currency matters, read *The Financial Times*. This London-based paper has long been the leading source for daily international financial news and now has an excellent American edition. Both its reporting and commentary on trade are first-class.

* * * * * * * * * * * *

And, again, our usual caveat: macro-economics is a tough game in which few people, Charlie and I included, have demonstrated skill. We may well turn out to be wrong in our currency judgments. (Indeed, the fact that so many pundits now predict weakness for the dollar makes us uneasy.) If so**,** our mistake will be very public. The irony is that if we chose the opposite course, leaving all of Berkshire's assets in dollars even as they declined significantly in value, no one would notice our mistake.

John Maynard Keynes said in his masterful *The General Theory*: "Worldly wisdom teaches that it is better for reputation to fail conventionally than to succeed unconventionally." (Or, to put it in less elegant terms, lemmings as a class may be derided but never does an *individual* lemming get criticized.) From a reputational standpoint, Charlie and I run a clear risk with our foreign-exchange commitment. But we believe in managing Berkshire as if we owned 100% of it ourselves. And, were that the case, we would not be following a dollar-only policy.

Miscellaneous

- Last year I told you about a group of University of Tennessee finance students who played a key role in our $1.7 billion acquisition of Clayton Homes. Earlier, they had been brought to Omaha by their professor, Al Auxier – he brings a class every year – to tour Nebraska Furniture Mart and Borsheim's, eat at Gorat's and have a Q&A session with me at Kiewit Plaza. These visitors, like those who come for our annual meeting, leave impressed by both the city and its friendly residents.

  Other colleges and universities have now come calling. This school year we will have visiting classes, ranging in size from 30 to 100 students, from Chicago, Dartmouth (Tuck), Delaware State, Florida State, Indiana, Iowa, Iowa State, Maryland, Nebraska, Northwest Nazarene, Pennsylvania (Wharton), Stanford, Tennessee, Texas, Texas A&M, Toronto (Rotman), Union and Utah. Most of the students are MBA candidates, and I've been impressed by their quality. They are keenly interested in business and investments, but their questions indicate that they also have more on their minds than simply making money. I always feel good after meeting them.

At our sessions, I tell the newcomers the story of the Tennessee group and its spotting of Clayton Homes. I do this in the spirit of the farmer who enters his hen house with an ostrich egg and admonishes the flock: "I don't like to complain, girls, but this is just a small sample of what the competition is doing." To date, our new scouts have not brought us deals. But their mission in life has been made clear to them.

- You should be aware of an accounting rule that mildly distorts our financial statements in a pain-today, gain-tomorrow manner. Berkshire purchases life insurance policies from individuals and corporations who would otherwise surrender them for cash. As the new holder of the policies, we pay any premiums that become due and ultimately – when the original holder dies – collect the face value of the policies.

  The original policyholder is usually in good health when we purchase the policy. Still, the price we pay for it is always well above its cash surrender value ("CSV"). Sometimes the original policyholder has borrowed against the CSV to make premium payments. In that case, the remaining CSV will be tiny and our purchase price will be a large multiple of what the original policyholder would have received, had he cashed out by surrendering it.

  Under accounting rules, we must immediately charge as a realized capital loss the excess over CSV that we pay upon purchasing the policy. We also must make additional charges each year for the amount by which the premium we pay to keep the policy in force exceeds the increase in CSV. But obviously, we don't think these bookkeeping charges represent economic losses. If we did, we wouldn't buy the policies.

  During 2004, we recorded net "losses" from the purchase of policies (and from the premium payments required to maintain them) totaling $207 million, which was charged against realized investment gains in our earnings statement (included in "other" in the table on page 17). When the proceeds from these policies are received in the future, we will record as realized investment gain the excess over the then-CSV.

- Two post-bubble governance reforms have been particularly useful at Berkshire, and I fault myself for not putting them in place many years ago. The first involves regular meetings of directors without the CEO present. I've sat on 19 boards, and on many occasions this process would have led to dubious plans being examined more thoroughly. In a few cases, CEO changes that were needed would also have been made more promptly. There is no downside to this process, and there are many possible benefits.

  The second reform concerns the "whistleblower line," an arrangement through which employees can send information to me and the board's audit committee without fear of reprisal. Berkshire's extreme decentralization makes this system particularly valuable both to me and the committee. (In a sprawling "city" of 180,000 – Berkshire's current employee count – not every sparrow that falls will be noticed at headquarters.) Most of the complaints we have received are of "the guy next to me has bad breath" variety, but on occasion I have learned of important problems at our subsidiaries that I otherwise would have missed. The issues raised are usually not of a type discoverable by audit, but relate instead to personnel and business practices. Berkshire would be more valuable today if I had put in a whistleblower line decades ago.

- Charlie and I love the idea of shareholders thinking and behaving like owners. Sometimes that requires them to be pro-active. And in this arena large institutional owners should lead the way.

  So far, however, the moves made by institutions have been less than awe-inspiring. Usually, they've focused on minutiae and ignored the three questions that truly count. First, does the company have the right CEO? Second, is he/she overreaching in terms of compensation? Third, are proposed acquisitions more likely to create or destroy per-share value?

On such questions, the interests of the CEO may well differ from those of the shareholders. Directors, moreover, sometimes lack the knowledge or gumption to overrule the CEO. Therefore, it's vital that large owners focus on these three questions and speak up when necessary.

Instead many simply follow a "checklist" approach to the issue *du jour*. Last year I was on the receiving end of a judgment reached in that manner. Several institutional shareholders and their advisors decided I lacked "independence" in my role as a director of Coca-Cola. One group wanted me removed from the board and another simply wanted me booted from the audit committee.

My first impulse was to secretly fund the group behind the second idea. Why anyone would wish to be on an audit committee is beyond me. But since directors must be assigned to one committee or another, and since no CEO wants me on his compensation committee, it's often been my lot to get an audit committee assignment. As it turned out, the institutions that opposed me failed and I was re-elected to the audit job. (I fought off the urge to ask for a recount.)

Some institutions questioned my "independence" because, among other things, McLane and Dairy Queen buy lots of Coke products. (Do they want us to favor Pepsi?) But independence is defined in Webster's as "not subject to control by others." I'm puzzled how anyone could conclude that our Coke purchases would "control" my decision-making when the counterweight is the well-being of $8 billion of Coke stock held by Berkshire. Assuming I'm even marginally rational, elementary arithmetic should make it clear that my heart and mind belong to the owners of Coke, not to its management.

I can't resist mentioning that Jesus understood the calibration of independence far more clearly than do the protesting institutions. In Matthew 6:21 He observed: "For where your treasure is, there will your heart be also." Even to an institutional investor, $8 billion should qualify as "treasure" that dwarfs any profits Berkshire might earn on its routine transactions with Coke.

Measured by the biblical standard, the Berkshire board is a model: (a) *every* director is a member of a family owning at least $4 million of stock; (b) *none* of these shares were acquired from Berkshire via options or grants; (c) *no* directors receive committee, consulting or board fees from the company that are more than a tiny portion of their annual income; and (d) although we have a standard corporate indemnity arrangement, we carry no liability insurance for directors.

At Berkshire, board members travel the same road as shareholders.

* * * * * * * * * * * *

Charlie and I have seen much behavior confirming the Bible's "treasure" point. In our view, based on our considerable boardroom experience, the *least* independent directors are likely to be those who receive an important fraction of their annual income from the fees they receive for board service (and who hope as well to be recommended for election to other boards and thereby to boost their income further). Yet these are the very board members most often classed as "independent."

Most directors of this type are decent people and do a first-class job. But they wouldn't be human if they weren't tempted to thwart actions that would threaten their livelihood. Some may go on to succumb to such temptations.

Let's look at an example based upon circumstantial evidence. I have first-hand knowledge of a recent acquisition proposal (not from Berkshire) that was favored by management, blessed by the company's investment banker and slated to go forward at a price above the level at which the stock had sold for some years (or now sells for). In addition, a number of directors favored the transaction and wanted it proposed to shareholders.

Several of their brethren, however, each of whom received board and committee fees totaling about $100,000 annually, scuttled the proposal, which meant that shareholders never learned of this multi-billion offer. Non-management directors owned little stock except for shares they had received from the company. Their open-market purchases in recent years had meanwhile been nominal, even though the stock had sold far below the acquisition price proposed. In other words, these directors didn't want the shareholders to be offered X even though they had consistently declined the opportunity to buy stock for their own account at a fraction of X.

I don't know which directors opposed letting shareholders see the offer. But I do know that $100,000 is an important portion of the annual income of some of those deemed "independent," clearly meeting the Matthew 6:21 definition of "treasure." If the deal had gone through, these fees would have ended.

Neither the shareholders nor I will ever know what motivated the dissenters. Indeed they themselves will not likely know, given that self-interest inevitably blurs introspection. We do know one thing, though: At the same meeting at which the deal was rejected, the board voted itself a significant increase in directors' fees.

- While we are on the subject of self-interest, let's turn again to the most important accounting mechanism still available to CEOs who wish to overstate earnings: the non-expensing of stock options. The accomplices in perpetuating this absurdity have been many members of Congress who have defied the arguments put forth by all Big Four auditors, all members of the Financial Accounting Standards Board and virtually all investment professionals.

  I'm enclosing an op-ed piece I wrote for *The Washington Post* describing a truly breathtaking bill that was passed 312-111 by the House last summer. Thanks to Senator Richard Shelby, the Senate didn't ratify the House's foolishness. And, to his great credit, Bill Donaldson, the investor-minded Chairman of the SEC, has stood firm against massive political pressure, generated by the check-waving CEOs who first muscled Congress in 1993 about the issue of option accounting and then repeated the tactic last year.

  Because the attempts to obfuscate the stock-option issue continue, it's worth pointing out that no one – neither the FASB, nor investors generally, nor I – are talking about restricting the use of options in any way. Indeed, my successor at Berkshire may well receive much of his pay via options, albeit logically-structured ones in respect to 1) an appropriate strike price, 2) an escalation in price that reflects the retention of earnings, and 3) a ban on his quickly disposing of any shares purchased through options. We cheer arrangements that motivate managers, whether these be cash bonuses or options. And if a company is truly receiving value for the options it issues, we see no reason why recording their cost should cut down on their use.

  The simple fact is that certain CEOs know their own compensation would be far more rationally determined if options were expensed. They also suspect that their stock would sell at a lower price if realistic accounting were employed, meaning that they would reap less in the market when they unloaded their personal holdings. To these CEOs such unpleasant prospects are a fate to be fought with all the resources they have at hand – even though the funds they use in that fight normally don't belong to them, but are instead put up by their shareholders.

  Option-expensing is scheduled to become mandatory on June 15th. You can therefore expect intensified efforts to stall or emasculate this rule between now and then. Let your Congressman and Senators know what you think on this issue.

The Annual Meeting

There are two changes this year concerning the annual meeting. First, we have scheduled the meeting for the last Saturday in April (the 30th), rather than the usual first Saturday in May. This year Mother's Day falls on May 8, and it would be unfair to ask the employees of Borsheim's and Gorat's to take care of us at that special time – so we've moved everything up a week. Next year we'll return to our regular timing, holding the meeting on May 6, 2006.

Additionally, we are changing the sequence of events on meeting day, April 30. Just as always, the doors will open at the Qwest Center at 7 a.m. and the movie will be shown at 8:30. At 9:30, however, we will go directly to the question and answer period, which (allowing for lunch at the Qwest's stands) will last until 3:00. Then, after a short recess, Charlie and I will convene the annual meeting at 3:15.

We have made this change because a number of shareholders complained last year about the time consumed by two speakers who advocated proposals of limited interest to the majority of the audience – and who were no doubt relishing their chance to talk to a captive group of about 19,500. With our new procedure, those shareholders who wish to hear it all can stick around for the formal meeting and those who don't can leave – or better yet shop.

There will be plenty of opportunity for that pastime in the vast exhibition hall that adjoins the meeting area. Kelly Muchemore, the Flo Ziegfeld of Berkshire, put on a magnificent shopping extravaganza last year, and she says that was just a warm-up for this year. (Kelly, I am delighted to report, is getting married in October. I'm giving her away and suggested that she make a little history by holding the wedding at the annual meeting. She balked, however, when Charlie insisted that he be the ringbearer.)

Again we will showcase a 2,100 square foot Clayton home (featuring Acme brick, Shaw carpet, Johns Manville insulation, MiTek fasteners, Carefree awnings and NFM furniture). Take a tour through the home. Better yet, buy it.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 45 of the 50 jurisdictions in which we operate. Bring the details of your existing insurance and check out whether we can save you money.

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets® available for your inspection. Stop by the NetJets booth at the Qwest to learn about viewing these planes. Come to Omaha by bus; leave in your new plane.

The Bookworm shop did a terrific business last year selling Berkshire-related books. Displaying 18 titles, they sold 2,920 copies for $61,000. Since we charge the shop no rent (I must be getting soft), it gives shareholders a 20% discount. This year I've asked The Bookworm to add Graham Allison's *Nuclear Terrorism: The Ultimate Preventable Catastrophe*, a must-read for those concerned with the safety of our country. In addition, the shop will premiere *Poor Charlie's Almanack*, a book compiled by Peter Kaufman. Scholars have for too long debated whether Charlie is the reincarnation of Ben Franklin. This book should settle the question.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. They do a terrific job for us each year, and I thank them for it.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing. We initiated this special event at NFM eight years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $25.1 million in 2004 (up 45%

from a year earlier). Every year has set a new record, and on Saturday of last year, we had the largest single-day sales in NFM's history – $6.1 million.

To get the discount, you must make your purchases between Thursday, April 28 and Monday, May 2 inclusive, and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. Monday through Saturday, and 10 a.m. to 6 p.m. on Sunday. On Saturday this year, from 5:30 p.m. to 8 p.m. we are having a special affair for shareholders only. I'll be there, eating barbeque and drinking Coke.

Borsheim's – the largest jewelry store in the country except for Tiffany's Manhattan store – will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, April 29. The second, the main gala, will be from 9 a.m. to 4 p.m. on Sunday, May 1. On Saturday, we will be open until 6 p.m.

We will have huge crowds at Borsheim's throughout the weekend. For your convenience, therefore, shareholder prices will be available from Monday, April 25 through Saturday, May 7. During that period, just identify yourself as a shareholder through your meeting credentials or a brokerage statement.

Borsheim's operates on a gross margin that is fully twenty percentage points below that of its major rivals, even before the shareholders' discount. Last year, business over the weekend increased 73% from 2003, setting a record that will be tough to beat. Show me it can be done.

In a tent outside of Borsheim's, Patrick Wolff, twice U.S. chess champion, will take on all comers in groups of six – blindfolded. Additionally, we will have Bob Hamman and Sharon Osberg, two of the world's top bridge experts, available to play with our shareholders on Sunday afternoon. They plan to keep their eyes *open* – but Bob never sorts his cards, even when playing for a national championship.

Gorat's – my favorite steakhouse – will again be open exclusively for Berkshire shareholders on Sunday, May 1, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on that day, you must have a reservation. To make one, call 402-551-3733 on April 1 (*but not before*). If Sunday is sold out, try Gorat's on one of the other evenings you will be in town. Enhance your reputation as an epicure by ordering, as I do, a rare T-bone with a double helping of hash browns.

We will again have a special reception from 4:00 to 5:30 on Saturday afternoon for shareholders who have come from outside of North America. Every year our meeting draws many people from around the globe, and Charlie and I want to be sure we personally greet those who have come so far. Last year we enjoyed meeting more than 400 of you including at least 100 from Australia. Any shareholder who comes from other than the U.S. or Canada will be given a special credential and instructions for attending this function.

* * * * * * * * * * * *

Charlie and I are lucky. We have jobs that we love and are helped every day in a myriad of ways by talented and cheerful associates. No wonder we tap-dance to work. But nothing is more fun for us than getting together with our shareholder-partners at Berkshire's annual meeting. So join us on April 30th at the Qwest for our annual Woodstock for Capitalists.

February 28, 2005

Warren E. Buffett
Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4

2003	21.0	28.7	(7.7)
2004	10.5	10.9	(.4)
2005	6.4	4.9	1.5
Average Annual Gain — 1965-2005	21.5	10.3	11.2
Overall Gain — 1964-2005	305,134	5,583	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P 500 in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2005 was $5.6 billion, which increased the per-share book value of both our Class A and Class B stock by 6.4%. Over the last 41 years (that is, since present management took over) book value has grown from $19 to $59,377, a rate of 21.5% compounded annually.*

Berkshire had a decent year in 2005. We initiated five acquisitions (two of which have yet to close) and most of our operating subsidiaries prospered. Even our insurance business in its entirety did well, though Hurricane Katrina inflicted record losses on both Berkshire and the industry. We estimate our loss from Katrina at $2.5 billion – and her ugly sisters, Rita and Wilma, cost us an additional $.9 billion.

Credit GEICO – and its brilliant CEO, Tony Nicely – for our stellar insurance results in a disaster-ridden year. One statistic stands out: In just two years, GEICO improved its productivity by *32%*. Remarkably, employment fell by 4% even as policy count grew by 26% – and more gains are in store. When we drive unit costs down in such a dramatic manner, we can offer ever-greater value to our customers. The payoff: Last year, GEICO gained market-share, earned commendable profits and strengthened its brand. If you have a new son or grandson in 2006, name him Tony.

* * * * * * * * * * * *

My goal in writing this report is to give you the information you need to estimate Berkshire's intrinsic value. I say "estimate" because calculations of intrinsic value, though all-important, are necessarily imprecise and often seriously wrong. The more uncertain the future of a business, the more possibility there is that the calculation will be wildly off-base. (For an explanation of intrinsic value, see pages 77 – 78.) Here Berkshire has some advantages: a wide variety of relatively-stable earnings streams, combined with great liquidity and minimum debt. These factors mean that Berkshire's intrinsic value can be more precisely calculated than can the intrinsic value of most companies.

Yet if precision is aided by Berkshire's financial characteristics, the job of calculating intrinsic value has been made more complex by the mere presence of so many earnings streams. Back in 1965, when we owned only a small textile operation, the task of calculating intrinsic value was a snap. Now we own 68 distinct businesses with widely disparate operating and financial characteristics. This array of unrelated enterprises, coupled with our massive investment holdings, makes it impossible for you to simply examine our consolidated financial statements and arrive at an informed estimate of intrinsic value.

We have attempted to ease this problem by clustering our businesses into four logical groups, each of which we discuss later in this report. In these discussions, we will provide the key figures for both the group and its important components. Of course, the value of Berkshire may be either greater or less than the sum of these four parts. The outcome depends on whether our many units function better or worse by being part of a larger enterprise and whether capital allocation improves or deteriorates when it is under the direction of a holding company. In other words, does Berkshire ownership bring anything to the party, or would our shareholders be better off if they directly owned shares in each of our 68 businesses? These are important questions but ones that you will have to answer for yourself.

Before we look at our individual businesses, however, let's review two sets of figures that show where we've come from and where we are now. The first set is the amount of investments (including cash and cash-equivalents) we own on a per-share basis. In making this calculation, we exclude investments held in our finance operation because these are largely offset by borrowings:

*****All figures used in this report apply to Berkshire's A shares, the successor to the only stock that the company had outstanding before 1996. The B shares have an economic interest equal to 1/30th that of the A.

Year	Per-Share Investments*
1965	$ 4
1975	159
1985	2,407
1995	21,817
2005	$74,129
Compound Growth Rate 1965-2005	28.0%
Compound Growth Rate 1995-2005	13.0%

*Net of minority interests

In addition to these marketable securities, which with minor exceptions are held in our insurance companies, we own a wide variety of non-insurance businesses. Below, we show the pre-tax earnings (excluding goodwill amortization) of these businesses, again on a per-share basis:

Year	Per-Share Earnings*
1965	$ 4
1975	4
1985	52
1995	175
2005	$2,441
Compound Growth Rate 1965-2005	17.2%
Compound Growth Rate 1995-2005	30.2%

*Pre-tax and net of minority interests

When growth rates are under discussion, it will pay you to be suspicious as to why the beginning and terminal years have been selected. If either year was aberrational, any calculation of growth will be distorted. In particular, a base year in which earnings were poor can produce a breathtaking, but meaningless, growth rate. In the table above, however, the base year of 1965 was abnormally *good*; Berkshire earned more money in that year than it did in all but one of the previous ten.

As you can see from the two tables, the comparative growth rates of Berkshire's two elements of value have changed in the last decade, a result reflecting our ever-increasing emphasis on business acquisitions. Nevertheless, Charlie Munger, Berkshire's Vice Chairman and my partner, and I want to increase the figures in *both* tables. In this ambition, we hope – metaphorically – to avoid the fate of the elderly couple who had been romantically challenged for some time. As they finished dinner on their 50th anniversary, however, the wife – stimulated by soft music, wine and candlelight – felt a long-absent tickle and demurely suggested to her husband that they go upstairs and make love. He agonized for a moment and then replied, "I can do one or the other, but not both."

Acquisitions

Over the years, our current businesses, in aggregate, should deliver modest growth in operating earnings. But they will not in themselves produce truly satisfactory gains. We will need major acquisitions to get that job done.

In this quest, 2005 was encouraging. We agreed to five purchases: two that were completed last year, one that closed after yearend and two others that we expect to close soon. None of the deals involve the issuance of Berkshire shares. That's a crucial, but often ignored, point: When a management proudly acquires another company for stock, the shareholders of the acquirer are concurrently selling part of their interest in everything they own. I've made this kind of deal a few times myself – and, on balance, my actions have cost you money.

Here are last year's purchases:

- On June 30 we bought Medical Protective Company ("MedPro"), a 106-year-old medical malpractice insurer based in Fort Wayne. Malpractice insurance is tough to underwrite and has proved to be a graveyard for many insurers. MedPro nevertheless should do well. It will have the attitudinal advantage that all Berkshire insurers share, wherein underwriting discipline trumps all other goals. Additionally, as part of Berkshire, MedPro has financial strength far exceeding that of its competitors, a quality assuring doctors that long-to-settle claims will not end up back on their doorstep because their insurer failed. Finally, the company has a smart and energetic CEO, Tim Kenesey, who instinctively thinks like a Berkshire manager.

- Forest River, our second acquisition, closed on August 31. A couple of months earlier, on June 21, I received a two-page fax telling me – point by point – why Forest River met the acquisition criteria we set forth on page 25 of this report. I had not before heard of the company, a recreational vehicle manufacturer with $1.6 billion of sales, nor of Pete Liegl, its owner and manager. But the fax made sense, and I immediately asked for more figures. These came the next morning, and that afternoon I made Pete an offer. On June 28, we shook hands on a deal.

  Pete is a remarkable entrepreneur. Some years back, he sold his business, then far smaller than today, to an LBO operator who promptly began telling him how to run the place. Before long, Pete left, and the business soon sunk into bankruptcy. Pete then repurchased it. You can be sure that *I* won't be telling Pete how to manage his operation.

  Forest River has 60 plants, 5,400 employees and has consistently gained share in the RV business, while also expanding into other areas such as boats. Pete is 61 – and definitely in an acceleration mode. Read the piece from *RV Business* that accompanies this report, and you'll see why Pete and Berkshire are made for each other.

- On November 12, 2005, an article ran in The Wall Street Journal dealing with Berkshire's unusual acquisition and managerial practices. In it Pete declared, "It was easier to sell my business than to renew my driver's license."

  In New York, Cathy Baron Tamraz read the article, and it struck a chord. On November 21, she sent me a letter that began, "As president of Business Wire, I'd like to introduce you to my company, as I believe it fits the profile of Berkshire Hathaway subsidiary companies as detailed in a recent Wall Street Journal article."

  By the time I finished Cathy's two-page letter, I felt Business Wire and Berkshire were a fit. I particularly liked her penultimate paragraph: "We run a tight ship and keep unnecessary spending under wraps. No secretaries or management layers here. Yet we'll invest big dollars to gain a technological advantage and move the business forward."

  I promptly gave Cathy a call, and before long Berkshire had reached agreement with Business Wire's controlling shareholder, Lorry Lokey, who founded the company in 1961 (and who had just made Cathy CEO). I love success stories like Lorry's. Today 78, he has built a company that disseminates information in 150 countries for 25,000 clients. His story, like those of many entrepreneurs who have selected Berkshire as a home for their life's work, is an example of what can happen when a good idea, a talented individual and hard work converge.

- In December we agreed to buy 81% of Applied Underwriters, a company that offers a combination of payroll services and workers' compensation insurance to small businesses. A majority of Applied's customers are located in California.

In 1998, though, when the company had 12 employees, it acquired an Omaha-based operation with 24 employees that offered a somewhat-similar service. Sid Ferenc and Steve Menzies, who have built Applied's remarkable business, concluded that Omaha had many advantages as an operational base – a brilliant insight, I might add – and today 400 of the company's 479 employees are located here.

Less than a year ago, Applied entered into a large reinsurance contract with Ajit Jain, the extraordinary manager of National Indemnity's reinsurance division. Ajit was impressed by Sid and Steve, and they liked Berkshire's method of operation. So we decided to join forces. We are pleased that Sid and Steve retain 19% of Applied. They started on a shoestring only 12 years ago, and it will be fun to see what they can accomplish with Berkshire's backing.

- Last spring, MidAmerican Energy, our 80.5% owned subsidiary, agreed to buy PacifiCorp, a major electric utility serving six Western states. An acquisition of this sort requires many regulatory approvals, but we've now obtained these and expect to close this transaction soon. Berkshire will then buy $3.4 billion of MidAmerican's common stock, which MidAmerican will supplement with $1.7 billion of borrowing to complete the purchase. You can't expect to earn outsized profits in regulated utilities, but the industry offers owners the opportunity to deploy large sums at fair returns – and therefore, it makes good sense for Berkshire. A few years back, I said that we hoped to make some very large purchases in the utility field. Note the plural – we'll be looking for more.

In addition to buying these new operations, we continue to make "bolt-on" acquisitions. Some aren't so small: Shaw, our carpet operation, spent about $550 million last year on two purchases that furthered its vertical integration and should improve its profit margin in the future. XTRA and Clayton Homes also made value-enhancing acquisitions.

Unlike many business buyers, Berkshire has no "exit strategy." We buy to keep. We do, though, have an entrance strategy, looking for businesses in this country or abroad that meet our six criteria and are available at a price that will produce a reasonable return. If you have a business that fits, give me a call. Like a hopeful teenage girl, I'll be waiting by the phone.

Insurance

Let's now talk about our four sectors and start with insurance, our core business. What counts here is the amount of "float" and its cost over time.

For new readers, let me explain. "Float" is money that doesn't belong to us but that we temporarily hold. Most of our float arises because (1) premiums are paid upfront though the service we provide – insurance protection – is delivered over a period that usually covers a year and; (2) loss events that occur today do not always result in our immediately paying claims, because it sometimes takes many years for losses to be reported (asbestos losses would be an example), negotiated and settled. The $20 million of float that came with our 1967 entry into insurance has now increased – both by way of internal growth and acquisitions – to $49 billion.

Float is wonderful – *if* it doesn't come at a high price. Its cost is determined by underwriting results, meaning how the expenses and losses we will ultimately pay compare with the premiums we have received. When an insurer earns an underwriting profit – as has been the case at Berkshire in about half of the 39 years we have been in the insurance business – float is better than free. In such years, we are actually paid for holding other people's money. For most insurers, however, life has been far more difficult: In aggregate, the property-casualty industry almost invariably operates at an underwriting loss. When that loss is large, float becomes expensive, sometimes devastatingly so.

In 2004 our float cost us less than nothing, and I told you that we had a chance – absent a mega-catastrophe – of no-cost float in 2005. But we *had* the mega-cat, and as a specialist in that coverage, Berkshire suffered hurricane losses of $3.4 billion. Nevertheless, our float was costless in 2005 because of the superb results we had in our other insurance activities, particularly at GEICO.

* * * * * * * * * * * *

Auto policies in force grew by 12.1% at GEICO, a gain increasing its market share of U.S. private passenger auto business from about 5.6% to about 6.1%. Auto insurance is a big business: Each share-point equates to $1.6 billion in sales.

While our brand strength is not quantifiable, I believe it also grew significantly. When Berkshire acquired control of GEICO in 1996, its annual advertising expenditures were $31 million. Last year we were up to $502 million. And I can't wait to spend more.

Our advertising works because we have a great story to tell: More people can save money by insuring with us than is the case with any other national carrier offering policies to all comers. (Some specialized auto insurers do particularly well for applicants fitting into their niches; also, because our national competitors use rating systems that differ from ours, they will sometimes beat our price.) Last year, we achieved by far the highest conversion rate – the percentage of internet and phone quotes turned into sales – in our history. This is powerful evidence that our prices are more attractive relative to the competition than ever before. Test us by going to GEICO.com or by calling 800-847-7536. Be sure to indicate you are a shareholder because that fact will often qualify you for a discount.

I told you last year about GEICO's entry into New Jersey in August, 2004. Drivers in that state love us. Our retention rate there for new policyholders is running higher than in any other state, and by sometime in 2007, GEICO is likely to become the third largest auto insurer in New Jersey. There, as elsewhere, our low costs allow low prices that lead to steady gains in profitable business.

That simple formula immediately impressed me 55 years ago when I first discovered GEICO. Indeed, at age 21, I wrote an article about the company – it's reproduced on page 24 – when its market value was $7 million. As you can see, I called GEICO "The Security I Like Best." And that's what I still call it.

* * * * * * * * * * * *

We have major reinsurance operations at General Re and National Indemnity. The former is run by Joe Brandon and Tad Montross, the latter by Ajit Jain. Both units performed well in 2005 considering the extraordinary hurricane losses that battered the industry.

It's an open question whether atmospheric, oceanic or other causal factors have dramatically changed the frequency or intensity of hurricanes. Recent experience is worrisome. We know, for instance, that in the 100 years before 2004, about 59 hurricanes of Category 3 strength, or greater, hit the Southeastern and Gulf Coast states, and that only three of these were Category 5s. We further know that in 2004 there were three Category 3 storms that hammered those areas and that these were followed by four more in 2005, one of them, Katrina, the most destructive hurricane in industry history. Moreover, there were three Category 5s near the coast last year that fortunately weakened before landfall.

Was this onslaught of more frequent and more intense storms merely an anomaly? Or was it caused by changes in climate, water temperature or other variables we don't fully understand? And could these factors be developing in a manner that will soon produce disasters dwarfing Katrina?

Joe, Ajit and I don't know the answer to these all-important questions. What we do know is that our ignorance means we must follow the course prescribed by Pascal in his famous wager about the existence of God. As you may recall, he concluded that since he didn't know the answer, his personal gain/loss ratio dictated an affirmative conclusion.

So guided, we've concluded that we should now write mega-cat policies only at prices far higher than prevailed last year – and then only with an aggregate exposure that would not cause us distress if shifts in some important variable produce far more costly storms in the near future. To a lesser degree, we felt this way after 2004 – and cut back our writings when prices didn't move. Now our caution has intensified. If prices seem appropriate, however, we continue to have both the ability and the appetite to be the largest writer of mega-cat coverage in the world.

* * * * * * * * * * * *

Our smaller insurers, with MedPro added to the fold, delivered truly outstanding results last year. However, what you see in the table below does not do full justice to their performance. That's because we increased the loss reserves of MedPro by about $125 million immediately after our purchase.

No one knows with any precision what amount will be required to pay the claims we inherited. Medical malpractice insurance is a "long-tail" line, meaning that claims often take many years to settle. In addition, there are other losses that have occurred, but that we won't even hear about for some time. One thing, though, we have learned – the hard way – after many years in the business: Surprises in insurance are far from symmetrical. You are lucky if you get one that is pleasant for every ten that go the other way. Too often, however, insurers react to looming loss problems with optimism. They behave like the fellow in a switchblade fight who, after his opponent has taken a mighty swipe at his throat, exclaimed, "You never touched me." His adversary's reply: "Just wait until you try to shake your head."

Excluding the reserves we added for prior periods, MedPro wrote at an underwriting profit. And our other primary companies, in aggregate, had an underwriting profit of $324 million on $1,270 million of volume. This is an extraordinary result, and our thanks go to Rod Eldred of Berkshire Hathaway Homestate Companies, John Kizer of Central States Indemnity, Tom Nerney of U. S. Liability, Don Towle of Kansas Bankers Surety and Don Wurster of National Indemnity.

Here's the overall tally on our underwriting and float for each major sector of insurance:

	(in $ millions)			
	Underwriting Profit (Loss)		*Yearend Float*	
Insurance Operations	*2005*	*2004*	*2005*	*2004*
General Re	$(334)	$ 3	$22,920	$23,120
B-H Reinsurance	(1,069)	417	16,233	15,278
GEICO	1,221	970	6,692	5,960
Other Primary	235*	161	3,442	1,736
Total	$ 53	$1,551	$49,287	$46,094

*Includes MedPro from June 30, 2005.

Regulated Utility Business

We have an 80.5% (fully diluted) interest in MidAmerican Energy Holdings, which owns a wide variety of utility operations. The largest of these are (1) Yorkshire Electricity and Northern Electric, whose 3.7 million electric customers make it the third largest distributor of electricity in the U.K.; (2) MidAmerican Energy, which serves 706,000 electric customers, primarily in Iowa; and (3) Kern River and Northern Natural pipelines, which carry 7.8% of the natural gas consumed in the U.S. When our PacifiCorp acquisition closes, we will add 1.6 million electric customers in six Western states, with Oregon and Utah providing us the most business. This transaction will increase MidAmerican's revenues by $3.3 billion and its assets by $14.1 billion.

The Public Utility Holding Company Act ("PUHCA") was repealed on August 8, 2005, a milestone that allowed Berkshire to convert its MidAmerican preferred stock into voting common shares on February 9, 2006. This conversion ended a convoluted corporate arrangement that PUHCA had forced upon us. Now we have 83.4% of both the common stock and the votes at MidAmerican, which allows us to consolidate the company's income for financial accounting and tax purposes. Our true economic interest, however, is the aforementioned 80.5%, since there are options outstanding that are sure to be exercised within a few years and that upon exercise will dilute our ownership.

Though our voting power has increased dramatically, the dynamics of our four-party ownership have not changed at all. We view MidAmerican as a partnership among Berkshire, Walter Scott, and two terrific managers, Dave Sokol and Greg Abel. It's unimportant how many votes each party has; we will make major moves only when we are unanimous in thinking them wise. Five years of working with Dave, Greg and Walter have underscored my original belief: Berkshire couldn't have better partners.

You will notice that this year we have provided you with two balance sheets, one representing our actual figures per GAAP on December 31, 2005 (which does *not* consolidate MidAmerican) and one that reflects the subsequent conversion of our preferred. All future financial reports of Berkshire will include MidAmerican's figures.

Somewhat incongruously, MidAmerican owns the second largest real estate brokerage firm in the U.S. And it's a gem. The parent company's name is HomeServices of America, but our 19,200 agents operate through 18 locally-branded firms. Aided by three small acquisitions, we participated in $64 billion of transactions last year, up 6.5% from 2004.

Currently, the white-hot market in residential real estate of recent years is cooling down, and that should lead to additional acquisition possibilities for us. Both we and Ron Peltier, the company's CEO, expect HomeServices to be far larger a decade from now.

Here are some key figures on MidAmerican's operations:

	Earnings (in $ millions)	
	2005	*2004*
U.K. utilities	$ 308	$ 326
Iowa utility	288	268
Pipelines	309	288
HomeServices	148	130
Other (net)	107	172
Income (loss) from discontinued zinc project	8	(579)
Earnings before corporate interest and taxes	1,168	605
Interest, other than to Berkshire	(200)	(212)
Interest on Berkshire junior debt	(157)	(170)
Income tax	(248)	(53)
Net earnings	$ 563	$ 170
Earnings applicable to Berkshire*	$ 523	$ 237
Debt owed to others	10,296	10,528
Debt owed to Berkshire	1,289	1,478

*Includes interest earned by Berkshire (net of related income taxes) of $102 in 2005 and $110 in 2004.

Finance and Financial Products

The star of our finance sector is Clayton Homes, masterfully run by Kevin Clayton. He does not owe his brilliant record to a rising tide: The manufactured-housing business has been disappointing since Berkshire purchased Clayton in 2003. Industry sales have stagnated at 40-year lows, and the recent uptick from Katrina-related demand will almost certainly be short-lived. In recent years, many industry participants have suffered losses, and only Clayton has earned significant money.

In this brutal environment Clayton has bought a large amount of manufactured-housing loans from major banks that found them unprofitable and difficult to service. Clayton's operating expertise and Berkshire's financial resources have made this an excellent business for us and one in which we are preeminent. We presently service $17 billion of loans, compared to $5.4 billon at the time of our purchase. Moreover, Clayton now owns $9.6 billion of its servicing portfolio, a position built up almost entirely since Berkshire entered the picture.

To finance this portfolio, Clayton borrows money from Berkshire, which in turn borrows the same amount publicly. For the use of its credit, Berkshire charges Clayton a one percentage-point markup on its borrowing cost. In 2005, the cost to Clayton for this arrangement was $83 million. That amount is included in "Other" income in the table on the facing page, and Clayton's earnings of $416 million are after deducting this payment.

On the manufacturing side, Clayton has also been active. To its original base of twenty plants, it first added twelve more in 2004 by way of the bankruptcy purchase of Oakwood, which just a few years earlier was one of the largest companies in the business. Then in 2005 Clayton purchased Karsten, a four-plant operation that greatly strengthens Clayton's position on the West Coast.

* * * * * * * * * * * *

Long ago, Mark Twain said: "A man who tries to carry a cat home by its tail will learn a lesson that can be learned in no other way." If Twain were around now, he might try winding up a derivatives business. After a few days, he would opt for cats.

We lost $104 million pre-tax last year in our continuing attempt to exit Gen Re's derivative operation. Our aggregate losses since we began this endeavor total $404 million.

Originally we had 23,218 contracts outstanding. By the start of 2005 we were down to 2,890. You might expect that our losses would have been stemmed by this point, but the blood has kept flowing. Reducing our inventory to 741 contracts last year cost us the $104 million mentioned above.

Remember that the rationale for establishing this unit in 1990 was Gen Re's wish to meet the needs of insurance clients. Yet one of the contracts we liquidated in 2005 had a term of 100 years! It's difficult to imagine what "need" such a contract could fulfill except, perhaps, the need of a compensation-conscious trader to have a long-dated contract on his books. Long contracts, or alternatively those with multiple variables, are the most difficult to mark to market (the standard procedure used in accounting for derivatives) and provide the most opportunity for "imagination" when traders are estimating their value. Small wonder that traders promote them.

A business in which huge amounts of compensation flow from assumed numbers is obviously fraught with danger. When two traders execute a transaction that has several, sometimes esoteric, variables and a far-off settlement date, their respective firms must subsequently value these contracts whenever they calculate their earnings. A given contract may be valued at one price by Firm A and at another by Firm B. You can bet that the valuation differences – and I'm personally familiar with several that were *huge* – tend to be tilted in a direction favoring higher earnings at each firm. It's a strange world in which two parties can carry out a paper transaction that each can promptly report as profitable.

I dwell on our experience in derivatives each year for two reasons. One is personal and unpleasant. The hard fact is that I have cost you a lot of money by not moving immediately to close down

Gen Re's trading operation. Both Charlie and I knew at the time of the Gen Re purchase that it was a problem and told its management that we wanted to exit the business. It was my responsibility to make sure that happened. Rather than address the situation head on, however, I wasted several years while we attempted to sell the operation. That was a doomed endeavor because no realistic solution could have extricated us from the maze of liabilities that was going to exist for decades. Our obligations were particularly worrisome because their potential to explode could not be measured. Moreover, if severe trouble occurred, we knew it was likely to correlate with problems elsewhere in financial markets.

So I failed in my attempt to exit painlessly, and in the meantime more trades were put on the books. Fault me for dithering. (Charlie calls it thumb-sucking.) When a problem exists, whether in personnel or in business operations, the time to act is *now*.

The second reason I regularly describe our problems in this area lies in the hope that our experiences may prove instructive for managers, auditors and regulators. In a sense, we are a canary in this business coal mine and should sing a song of warning as we expire. The number and value of derivative contracts outstanding in the world continues to mushroom and is now a multiple of what existed in 1998, the last time that financial chaos erupted.

Our experience should be particularly sobering because we were a better-than-average candidate to exit gracefully. Gen Re was a relatively minor operator in the derivatives field. It has had the good fortune to unwind its supposedly liquid positions in a benign market, all the while free of financial or other pressures that might have forced it to conduct the liquidation in a less-than-efficient manner. Our accounting in the past was conventional and actually thought to be conservative. Additionally, we know of no bad behavior by anyone involved.

It could be a different story for others in the future. Imagine, if you will, one or more firms (troubles often spread) with positions that are many multiples of ours attempting to liquidate in chaotic markets and under extreme, and well-publicized, pressures. This is a scenario to which much attention should be given now rather than after the fact. The time to have considered – and improved – the reliability of New Orleans' levees was *before* Katrina.

When we finally wind up Gen Re Securities, my feelings about its departure will be akin to those expressed in a country song, "My wife ran away with my best friend, and I sure miss him a lot."

* * * * * * * * * * * *

Below are the results of our various finance and financial products activities:

	(in $ millions)			
	Pre-Tax Earnings		*Interest-Bearing Liabilities*	
	2005	*2004*	*2005*	*2004*
Trading – ordinary income	$ 200	$ 264	$1,061	$5,751
Gen Re Securities (loss)	(104)	(44)	2,617*	5,437*
Life and annuity operation	11	(57)	2,461	2,467
Value Capital (loss)	(33)	30	N/A	N/A
Leasing operations	173	92	370	391
Manufactured-housing finance (Clayton)	416	192	9,299	3,636
Other	159	107	N/A	N/A
Income before capital gains	822	584		
Trading – capital gains (losses)	(234)	1,750		
Total	$ 588	$2,334		

*Includes all liabilities

Manufacturing, Service and Retailing Operations

Our activities in this part of Berkshire cover the waterfront. Let's look, though, at a summary balance sheet and earnings statement for the entire group.

Balance Sheet 12/31/05 (in $ millions)

Assets		*Liabilities and Equity*	
Cash and equivalents	$ 1,004	Notes payable	$ 1,469
Accounts and notes receivable	3,287	Other current liabilities	5,371
Inventory	4,143	Total current liabilities	6,840
Other current assets	342		
Total current assets	8,776		
Goodwill and other intangibles	9,260	Deferred taxes	338
Fixed assets	7,148	Term debt and other liabilities	2,188
Other assets	1,021	Equity	16,839
	$26,205		$26,205

Earnings Statement (in $ millions)

	2005	*2004*	*2003*
Revenues	$46,896	$44,142	$32,106
Operating expenses (including depreciation of $699 in 2005, $676 in 2004 and $605 in 2003)	44,190	41,604	29,885
Interest expense (net)	83	57	64
Pre-tax earnings	2,623	2,481	2,157
Income taxes	977	941	813
Net income	$ 1,646	$ 1,540	$ 1,344

This eclectic collection, which sells products ranging from Dilly Bars to fractional interests in Boeing 737s, earned a very respectable 22.2% on average tangible net worth last year. It's noteworthy also that these operations used only minor financial leverage in achieving that return. Clearly, we own some terrific businesses. We purchased many of them, however, at substantial premiums to net worth – a point reflected in the goodwill item shown on the balance sheet – and that fact reduces the earnings on our average *carrying* value to 10.1%.

Here are the pre-tax earnings for the larger categories or units.

	Pre-Tax Earnings (in $ millions)	
	2005	*2004*
Building Products	$ 751	$ 643
Shaw Industries	485	466
Apparel & Footwear	348	325
Retailing of Jewelry, Home Furnishings and Candy	257	215
Flight Services	120	191
McLane	217	228
Other businesses	445	413
	$2,623	$2,481

- In both our building-products companies and at Shaw, we continue to be hit by rising costs for raw materials and energy. Most of these operations are significant users of oil (or more specifically, petrochemicals) and natural gas. And prices for these commodities have soared.

  We, likewise, have raised prices on many products, but there are often lags before increases become effective. Nevertheless, both our building-products operations and Shaw delivered respectable results in 2005, a fact attributable to their strong business franchises and able managements.

- In apparel, our largest unit, Fruit of the Loom, again increased earnings and market-share. You know, of course, of our leadership position in men's and boys' underwear, in which we account for about 48.7% of the sales recorded by mass-marketers (Wal-Mart, Target, etc.). That's up from 44.2% in 2002, when we acquired the company. Operating from a smaller base, we have made still greater gains in intimate apparel for women and girls that is sold by the mass-marketers, climbing from 13.7% of their sales in 2002 to 24.7% in 2005. A gain like that in a major category doesn't come easy. Thank John Holland, Fruit's extraordinary CEO, for making this happen.

- I told you last year that Ben Bridge (jewelry) and R. C. Willey (home furnishings) had same-store sales gains far above the average of their industries. You might think that blow-out figures in one year would make comparisons difficult in the following year. But Ed and Jon Bridge at their operation and Scott Hymas at R. C. Willey were more than up to this challenge. Ben Bridge had a 6.6% same-store gain in 2005, and R. C. Willey came in at 9.9%.

  Our never-on-Sunday approach at R. C. Willey continues to overwhelm seven-day competitors as we roll out stores in new markets. The Boise store, about which I was such a skeptic a few years back, had a 21% gain in 2005, coming off a 10% gain in 2004. Our new Reno store, opened in November, broke out of the gate fast with sales that exceeded Boise's early pace, and we will begin business in Sacramento in June. If this store succeeds as I expect it to, Californians will see many more R. C. Willey stores in the years to come.

- In flight services, earnings improved at FlightSafety as corporate aviation continued its rebound. To support growth, we invest heavily in new simulators. Our most recent expansion, bringing us to 42 training centers, is a major facility at Farnborough, England that opened in September. When it is fully built out in 2007, we will have invested more than $100 million in the building and its 15 simulators. Bruce Whitman, FlightSafety's able CEO, makes sure that no competitor comes close to offering the breadth and depth of services that we do.

  Operating results at NetJets were a different story. I said last year that this business would earn money in 2005 – and I was dead wrong.

  Our European operation, it should be noted, showed both excellent growth and a reduced loss. Customer contracts there increased by 37%. We are the only fractional-ownership operation of any size in Europe, and our now-pervasive presence there is a key factor in making NetJets the worldwide leader in this industry.

  Despite a large increase in customers, however, our U.S. operation dipped far into the red. Its efficiency fell, and costs soared. We believe that our three largest competitors suffered similar problems, but each is owned by aircraft manufacturers that may think differently than we do about the necessity of making adequate profits. The *combined* value of the fleets managed by these three competitors, in any case, continues to be less valuable than the fleet that we operate.

  Rich Santulli, one of the most dynamic managers I've ever met, will solve our revenue/expense problem. He won't do it, however, in a manner that impairs the quality of the NetJets experience. Both he and I are committed to a level of service, security and safety that can't be matched by others.

- Our retailing category includes See's Candies, a company we bought early in 1972 (a date making it our oldest non-insurance business). At that time, Charlie and I immediately decided to put Chuck Huggins, then 46, in charge. Though we were new at the game of selecting managers, Charlie and I hit a home run with this appointment. Chuck's love for the customer and the brand permeated the organization, which in his 34-year tenure produced a more-than-tenfold increase in profits. This gain was achieved in an industry growing at best slowly and perhaps not at all. (Volume figures in this industry are hard to pin down.)

  At yearend, Chuck turned the reins at See's over to Brad Kinstler, who previously had served Berkshire well while running Cypress Insurance and Fechheimer's. It's unusual for us to move managers around, but Brad's record made him an obvious choice for the See's job. I hope Chuck and his wife, Donna, are at the annual meeting. If they are, shareholders can join Charlie and me in giving America's number one candy maker a richly-deserved round of applause.

* * * * * * * * * * * *

Every day, in countless ways, the competitive position of each of our businesses grows either weaker or stronger. If we are delighting customers, eliminating unnecessary costs and improving our products and services, we gain strength. But if we treat customers with indifference or tolerate bloat, our businesses will wither. On a daily basis, the effects of our actions are imperceptible; cumulatively, though, their consequences are enormous.

When our long-term competitive position improves as a result of these almost unnoticeable actions, we describe the phenomenon as "widening the moat." And doing that is essential if we are to have the kind of business we want a decade or two from now. We always, of course, hope to earn more money in the short-term. But when short-term and long-term conflict, widening the moat *must* take precedence. If a management makes bad decisions in order to hit short-term earnings targets, and consequently gets behind the eight-ball in terms of costs, customer satisfaction or brand strength, no amount of subsequent brilliance will overcome the damage that has been inflicted. Take a look at the dilemmas of managers in the auto and airline industries today as they struggle with the huge problems handed them by their predecessors. Charlie is fond of quoting Ben Franklin's "An ounce of prevention is worth a pound of cure." But sometimes no amount of cure will overcome the mistakes of the past.

Our managers focus on moat-widening – and are brilliant at it. Quite simply, they are passionate about their businesses. Usually, they were running those long before we came along; our only function since has been to stay out of the way. If you see these heroes – and our four heroines as well – at the annual meeting, thank them for the job they do for you.

* * * * * * * * * * * *

The attitude of our managers vividly contrasts with that of the young man who married a tycoon's only child, a decidedly homely and dull lass. Relieved, the father called in his new son-in-law after the wedding and began to discuss the future:

"Son, you're the boy I always wanted and never had. Here's a stock certificate for 50% of the company. You're my equal partner from now on."

"Thanks, dad."

"Now, what would you like to run? How about sales?"

"I'm afraid I couldn't sell water to a man crawling in the Sahara."

"Well then, how about heading human relations?"

"I really don't care for people."

"No problem, we have lots of other spots in the business. What would you like to do?"

"Actually, nothing appeals to me. Why don't you just buy me out?"

Investments

We show below our common stock investments. Those that had a market value of more than $700 million at the end of 2005 are itemized.

			12/31/05	
Shares	*Company*	*Percentage of Company Owned*	*Cost**	*Market*
			(in $ millions)	
151,610,700	American Express Company	12.2	$1,287	$ 7,802
30,322,137	Ameriprise Financial, Inc.	12.1	183	1,243
43,854,200	Anheuser-Busch Cos., Inc.	5.6	2,133	1,884
200,000,000	The Coca-Cola Company	8.4	1,299	8,062
6,708,760	M&T Bank Corporation	6.0	103	732
48,000,000	Moody's Corporation	16.2	499	2,948
2,338,961,000	PetroChina "H" shares (or equivalents)	1.3	488	1,915
100,000,000	The Procter & Gamble Company	3.0	940	5,788
19,944,300	Wal-Mart Stores, Inc.	0.5	944	933
1,727,765	The Washington Post Company	18.0	11	1,322
95,092,200	Wells Fargo & Company	5.7	2,754	5,975
1,724,200	White Mountains Insurance	16.0	369	963
	Others		4,937	7,154
	Total Common Stocks		$15,947	$46,721

*This is our actual purchase price and also our tax basis; GAAP "cost" differs in a few cases because of write-ups or write-downs that have been required.

A couple of last year's changes in our portfolio occurred because of corporate events: Gillette was merged into Procter & Gamble, and American Express spun off Ameriprise. In addition, we substantially increased our holdings in Wells Fargo, a company that Dick Kovacevich runs brilliantly, and established positions in Anheuser-Busch and Wal-Mart.

Expect no miracles from our equity portfolio. Though we own major interests in a number of strong, highly-profitable businesses, they are not selling at anything like bargain prices. As a group, they may double in value in ten years. The likelihood is that their per-share earnings, in aggregate, will grow 6-8% per year over the decade and that their stock prices will more or less match that growth. (Their managers, of course, think my expectations are too modest – and I hope they're right.)

* * * * * * * * * * * *

The P&G-Gillette merger, closing in the fourth quarter of 2005, required Berkshire to record a $5.0 billion pre-tax capital gain. This bookkeeping entry, dictated by GAAP, is meaningless from an economic standpoint, and you should ignore it when you are evaluating Berkshire's 2005 earnings. We didn't intend to sell our Gillette shares before the merger; we don't intend to sell our P&G shares now; and we incurred no tax when the merger took place.

It's hard to overemphasize the importance of who is CEO of a company. Before Jim Kilts arrived at Gillette in 2001, the company was struggling, having particularly suffered from capital-allocation blunders. In the major example, Gillette's acquisition of Duracell cost Gillette shareholders billions of dollars, a loss never made visible by conventional accounting. Quite simply, what Gillette received in business value in this acquisition was not equivalent to what it gave up. (Amazingly, this most fundamental of yardsticks is almost always ignored by both managements and their investment bankers when acquisitions are under discussion.)

Upon taking office at Gillette, Jim quickly instilled fiscal discipline, tightened operations and energized marketing, moves that dramatically increased the intrinsic value of the company. Gillette's merger with P&G then expanded the potential of both companies. For his accomplishments, Jim was paid very well – but he earned every penny. (This is no academic evaluation: As a 9.7% owner of Gillette, Berkshire in effect paid that proportion of his compensation.) Indeed, it's difficult to overpay the *truly* extraordinary CEO of a giant enterprise. But this species is rare.

Too often, executive compensation in the U.S. is ridiculously out of line with performance. That won't change, moreover, because the deck is stacked against investors when it comes to the CEO's pay. The upshot is that a mediocre-or-worse CEO – aided by his handpicked VP of human relations and a consultant from the ever-accommodating firm of Ratchet, Ratchet and Bingo – all too often receives gobs of money from an ill-designed compensation arrangement.

Take, for instance, ten year, fixed-price options (and who wouldn't?). If Fred Futile, CEO of Stagnant, Inc., receives a bundle of these – let's say enough to give him an option on 1% of the company – his self-interest is clear: He should skip dividends entirely and instead use all of the company's earnings to repurchase stock.

Let's assume that under Fred's leadership Stagnant lives up to its name. In each of the ten years after the option grant, it earns $1 billion on $10 billion of net worth, which initially comes to $10 per share on the 100 million shares then outstanding. Fred eschews dividends and regularly uses all earnings to repurchase shares. If the stock constantly sells at ten times earnings per share, it will have appreciated 158% by the end of the option period. That's because repurchases would reduce the number of shares to 38.7 million by that time, and earnings per share would thereby increase to $25.80. Simply by withholding earnings from owners, Fred gets very rich, making a cool $158 million, despite the business itself improving not at all. Astonishingly, Fred could have made more than $100 million if Stagnant's earnings had *declined* by 20% during the ten-year period.

Fred can also get a splendid result for himself by paying no dividends and deploying the earnings he withholds from shareholders into a variety of disappointing projects and acquisitions. Even if these initiatives deliver a paltry 5% return, Fred will still make a bundle. Specifically – with Stagnant's p/e ratio remaining unchanged at ten – Fred's option will deliver him $63 million. Meanwhile, his shareholders will wonder what happened to the "alignment of interests" that was supposed to occur when Fred was issued options.

A "normal" dividend policy, of course – one-third of earnings paid out, for example – produces less extreme results but still can provide lush rewards for managers who achieve nothing.

CEOs understand this math and know that every dime paid out in dividends reduces the value of all outstanding options. I've never, however, seen this manager-owner conflict referenced in proxy materials that request approval of a fixed-priced option plan. Though CEOs invariably preach *internally* that capital comes at a cost, they somehow forget to tell shareholders that fixed-price options give them capital that is free.

It doesn't have to be this way: It's child's play for a board to design options that give effect to the automatic build-up in value that occurs when earnings are retained. But – surprise, surprise – options of that kind are almost never issued. Indeed, the very thought of options with strike prices that are adjusted for retained earnings seems foreign to compensation "experts," who are nevertheless encyclopedic about every management-friendly plan that exists. ("Whose bread I eat, his song I sing.")

Getting fired can produce a particularly bountiful payday for a CEO. Indeed, he can "earn" more in that single day, while cleaning out his desk, than an American worker earns in a lifetime of cleaning toilets. Forget the old maxim about nothing succeeding like success: Today, in the executive suite, the all-too-prevalent rule is that nothing succeeds like *failure*.

Huge severance payments, lavish perks and outsized payments for ho-hum performance often occur because comp committees have become slaves to comparative data. The drill is simple: Three or so directors – *not chosen by chance* – are bombarded for a few hours before a board meeting with pay statistics that perpetually ratchet upwards. Additionally, the committee is told about new perks that other managers are receiving. In this manner, outlandish "goodies" are showered upon CEOs simply because of a corporate version of the argument we all used when children: "But, Mom, all the other kids have one." When comp committees follow this "logic," yesterday's most egregious excess becomes today's baseline.

Comp committees should adopt the attitude of Hank Greenberg, the Detroit slugger and a boyhood hero of mine. Hank's son, Steve, at one time was a player's agent. Representing an outfielder in negotiations with a major league club, Steve sounded out his dad about the size of the signing bonus he should ask for. Hank, a true pay-for-performance guy, got straight to the point, "What did he hit last year?" When Steve answered ".246," Hank's comeback was immediate: "Ask for a uniform."

(Let me pause for a brief confession: In criticizing comp committee behavior, I don't speak as a true insider. Though I have served as a director of twenty public companies, only one CEO has put me on his comp committee. Hmmmm . . .)

* * * * * * * * * * * *

My views on America's long-term problem in respect to trade imbalances, which I have laid out in previous reports, remain unchanged. My conviction, however, cost Berkshire $955 million pre-tax in 2005. That amount is included in our earnings statement, a fact that illustrates the differing ways in which GAAP treats gains and losses. When we have a long-term position in stocks or bonds, year-to-year changes in value are reflected in our balance sheet but, as long as the asset is not sold, are rarely reflected in earnings. For example, our Coca-Cola holdings went from $1 billion in value early on to $13.4 billion at yearend 1998 and have since declined to $8.1 billion – with none of these moves affecting our earnings statement. Long-term currency positions, however, are daily marked to market and therefore have an effect on earnings in every reporting period. From the date we first entered into currency contracts, we are $2.0 billion in the black.

We reduced our direct position in currencies somewhat during 2005. We partially offset this change, however, by purchasing equities whose prices are denominated in a variety of foreign currencies and that earn a large part of their profits internationally. Charlie and I prefer this method of acquiring non-dollar exposure. That's largely because of changes in interest rates: As U.S. rates have risen relative to those of the rest of the world, holding most foreign currencies now involves a significant negative "carry." The carry aspect of our direct currency position indeed cost us money in 2005 and is likely to do so again in 2006. In contrast, the ownership of foreign equities is likely, over time, to create a positive carry – perhaps a substantial one.

The underlying factors affecting the U.S. current account deficit continue to worsen, and no letup is in sight. Not only did our trade deficit – the largest and most familiar item in the current account – hit an all-time high in 2005, but we also can expect a second item – the balance of investment income – to soon turn negative. As foreigners increase their ownership of U.S. assets (or of claims against us) relative to U.S. investments abroad, these investors will begin earning more on their holdings than we do on ours. Finally, the third component of the current account, unilateral transfers, is always negative.

The U.S., it should be emphasized, is extraordinarily rich and will get richer. As a result, the huge imbalances in its current account may continue for a long time without their having noticeable deleterious effects on the U.S. economy or on markets. I doubt, however, that the situation will forever remain benign. Either Americans address the problem soon in a way we select, or at some point the problem will likely address us in an unpleasant way of its own.

How to Minimize Investment Returns

It's been an easy matter for Berkshire and other owners of American equities to prosper over the years. Between December 31, 1899 and December 31, 1999, to give a really long-term example, the Dow rose from 66 to 11,497. (Guess what annual growth rate is required to produce this result; the surprising answer is at the end of this section.) This huge rise came about for a simple reason: Over the century American businesses did extraordinarily well and investors rode the wave of their prosperity. Businesses continue to do well. But now shareholders, through a series of self-inflicted wounds, are in a major way cutting the returns they will realize from their investments.

The explanation of how this is happening begins with a fundamental truth: With unimportant exceptions, such as bankruptcies in which some of a company's losses are borne by creditors, *the most that owners in aggregate can earn between now and Judgment Day is what their businesses in aggregate earn.* True, by buying and selling that is clever or lucky, investor A may take more than his share of the pie at the expense of investor B. And, yes, all investors *feel* richer when stocks soar. But an owner can exit only by having someone take his place. If one investor sells high, another must buy high. For owners as a whole, there is simply no magic – no shower of money from outer space – that will enable them to extract wealth from their companies beyond that created by the companies themselves.

Indeed, owners must earn less than their businesses earn because of "frictional" costs. And that's my point: These costs are now being incurred in amounts that will cause shareholders to earn *far* less than they historically have.

To understand how this toll has ballooned, imagine for a moment that all American corporations are, and always will be, owned by a single family. We'll call them the Gotrocks. After paying taxes on dividends, this family – generation after generation – becomes richer by the aggregate amount earned by its companies. Today that amount is about $700 billion annually. Naturally, the family spends some of these dollars. But the portion it saves steadily compounds for its benefit. In the Gotrocks household everyone grows wealthier at the same pace, and all is harmonious.

But let's now assume that a few fast-talking Helpers approach the family and persuade each of its members to try to outsmart his relatives by buying certain of their holdings and selling them certain others. The Helpers – for a fee, of course – obligingly agree to handle these transactions. The Gotrocks still own all of corporate America; the trades just rearrange who owns what. So the family's annual gain in wealth diminishes, equaling the earnings of American business *minus* commissions paid. The more that family members trade, the smaller their share of the pie and the larger the slice received by the Helpers. This fact is not lost upon these broker-Helpers: Activity is their friend and, in a wide variety of ways, they urge it on.

After a while, most of the family members realize that they are not doing so well at this new "beat-my-brother" game. Enter another set of Helpers. These newcomers explain to each member of the Gotrocks clan that by himself he'll never outsmart the rest of the family. The suggested cure: "Hire a manager – yes, us – and get the job done professionally." These manager-Helpers continue to use the broker-Helpers to execute trades; the managers may even increase their activity so as to permit the brokers to prosper still more. Overall, a bigger slice of the pie now goes to the two classes of Helpers.

The family's disappointment grows. Each of its members is now employing professionals. Yet overall, the group's finances have taken a turn for the worse. The solution? More help, of course.

It arrives in the form of financial planners and institutional consultants, who weigh in to advise the Gotrocks on selecting manager-Helpers. The befuddled family welcomes this assistance. By now its members know they can pick neither the right stocks nor the right stock-pickers. Why, one might ask, should they expect success in picking the right consultant? But this question does not occur to the Gotrocks, and the consultant-Helpers certainly don't suggest it to them.

The Gotrocks, now supporting three classes of expensive Helpers, find that their results get worse, and they sink into despair. But just as hope seems lost, a fourth group – we'll call them the hyper-Helpers – appears. These friendly folk explain to the Gotrocks that their unsatisfactory results are occurring because the existing Helpers – brokers, managers, consultants – are not sufficiently motivated and are simply going through the motions. "What," the new Helpers ask, "can you expect from such a bunch of zombies?"

The new arrivals offer a breathtakingly simple solution: *Pay more money*. Brimming with self-confidence, the hyper-Helpers assert that huge contingent payments – in addition to stiff fixed fees – are what each family member must fork over in order to *really* outmaneuver his relatives.

The more observant members of the family see that some of the hyper-Helpers are really just manager-Helpers wearing new uniforms, bearing sewn-on sexy names like HEDGE FUND or PRIVATE EQUITY. The new Helpers, however, assure the Gotrocks that this change of clothing is all-important, bestowing on its wearers magical powers similar to those acquired by mild-mannered Clark Kent when he changed into his Superman costume. Calmed by this explanation, the family decides to pay up.

And that's where we are today: A record portion of the earnings that would go in their entirety to owners – if they all just stayed in their rocking chairs – is now going to a swelling army of Helpers. Particularly expensive is the recent pandemic of profit arrangements under which Helpers receive large portions of the winnings when they are smart or lucky, and leave family members with all of the losses – and large fixed fees to boot – when the Helpers are dumb or unlucky (or occasionally crooked).

A sufficient number of arrangements like this – heads, the Helper takes much of the winnings; tails, the Gotrocks lose and pay dearly for the privilege of doing so – may make it more accurate to call the family the Hadrocks. Today, in fact, the family's frictional costs of all sorts may well amount to 20% of the earnings of American business. In other words, the burden of paying Helpers may cause American equity investors, overall, to earn only 80% or so of what they would earn if they just sat still and listened to no one.

Long ago, Sir Isaac Newton gave us three laws of motion, which were the work of genius. But Sir Isaac's talents didn't extend to investing: He lost a bundle in the South Sea Bubble, explaining later, "I can calculate the movement of the stars, but not the madness of men." If he had not been traumatized by this loss, Sir Isaac might well have gone on to discover the Fourth Law of Motion*: For investors as a whole, returns decrease as motion increases.*

* * * * * * * * * * * *

Here's the answer to the question posed at the beginning of this section: To get very specific, the Dow increased from 65.73 to 11,497.12 in the 20th century, and that amounts to a gain of 5.3% compounded annually. (Investors would also have received dividends, of course.) To achieve an equal rate of gain in the 21st century, the Dow will have to rise by December 31, 2099 to – brace yourself – precisely 2,011,011.23. But I'm willing to settle for 2,000,000; six years into this century, the Dow has gained not at all.

Debt and Risk

As we consolidate MidAmerican, our new balance sheet may suggest that Berkshire has expanded its tolerance for borrowing. But that's not so. Except for token amounts, we shun debt, turning to it for only three purposes:

1) We occasionally use repos as a part of certain short-term investing strategies that incorporate ownership of U.S. government (or agency) securities. Purchases of this kind are highly opportunistic and involve only the most liquid of securities. A few years ago, we entered into several interesting transactions that have since been unwound or are running off. The offsetting debt has likewise been cut substantially and before long may be gone.

2) We borrow money against portfolios of interest-bearing receivables whose risk characteristics we understand. We did this in 2001 when we guaranteed $5.6 billion of bank debt to take over, in partnership with Leucadia, a bankrupt Finova (which held a broad range of receivables). All of that debt has been repaid. More recently, we have borrowed to finance a widely-diversified, predictably-performing portfolio of manufactured-home receivables managed by Clayton. Alternatively, we could "securitize" – that is, sell – these receivables, but retain the servicing of them. If we followed this procedure, which is common in the industry, we would not show the debt that we do on our balance sheet, and we would also accelerate the earnings we report. In the end, however, we would earn less money. Were market variables to change so as to favor securitization (an unlikely event), we could sell part of our portfolio and eliminate the related debt. Until then, we prefer better profits to better cosmetics.

3) At MidAmerican, we have substantial debt, but it is that company's obligation only. Though it will appear on our consolidated balance sheet, Berkshire does *not* guarantee it.

   Even so, this debt is unquestionably secure because it is serviced by MidAmerican's diversified stream of highly-stable utility earnings. If there were to be some bolt from the blue that hurt one of MidAmerican's utility properties, earnings from the others would still be more than ample to cover all debt requirements. Moreover, MidAmerican retains all of its earnings, an equity-building practice that is rare in the utility field.

   From a risk standpoint, it is far safer to have earnings from ten diverse and uncorrelated utility operations that cover interest charges by, say, a 2:1 ratio than it is to have far greater coverage provided by a single utility. A catastrophic event can render a single utility insolvent – witness what Katrina did to the local electric utility in New Orleans – no matter how conservative its debt policy. A geographical disaster – say, an earthquake in a Western state – can't have the same effect on MidAmerican. And even a worrier like Charlie can't think of an event that would systemically decrease utility earnings in any major way. Because of MidAmerican's ever-widening diversity of regulated earnings, it will always utilize major amounts of debt.

And that's about it. We are not interested in incurring any significant debt at Berkshire for acquisitions or operating purposes. Conventional business wisdom, of course, would argue that we are being too conservative and that there are added profits that could be safely earned if we injected moderate leverage into our balance sheet.

Maybe so. But many of Berkshire's hundreds of thousands of investors have a large portion of their net worth in our stock (among them, it should be emphasized, a large number of our board and key managers) and a disaster for the company would be a disaster for them. Moreover, there are people who have been permanently injured to whom we owe insurance payments that stretch out for fifty years or more. To these and other constituencies we have promised total security, whatever comes: financial panics, stock-exchange closures (an extended one occurred in 1914) or even domestic nuclear, chemical or biological attacks.

We are quite willing to accept huge risks. Indeed, more than any other insurer, we write high-limit policies that are tied to single catastrophic events. We also own a large investment portfolio whose market value could fall dramatically and quickly under certain conditions (as happened on October 19, 1987). Whatever occurs, though, Berkshire will have the net worth, the earnings streams and the liquidity to handle the problem with ease.

Any other approach is dangerous. Over the years, a number of very smart people have learned the hard way that a long string of impressive numbers multiplied by a single zero always equals zero. That is not an equation whose effects I would like to experience personally, and I would like even less to be responsible for imposing its penalties upon others.

Management Succession

As owners, you are naturally concerned about whether I will insist on continuing as CEO after I begin to fade and, if so, how the board will handle that problem. You also want to know what happens if I should die tonight.

That second question is easy to answer. Most of our many businesses have strong market positions, significant momentum, and terrific managers. The special Berkshire culture is deeply ingrained throughout our subsidiaries, and these operations won't miss a beat when I die.

Moreover, we have three managers at Berkshire who are reasonably young and fully capable of being CEO. Any of the three would be much better at certain management aspects of my job than I. On the minus side, none has my crossover experience that allows me to be comfortable making decisions in either the business arena or in investments. That problem will be solved by having another person in the organization handle marketable securities. That's an interesting job at Berkshire, and the new CEO will have no problem in hiring a talented individual to do it. Indeed, that's what we have done at GEICO for 26 years, and our results have been terrific.

Berkshire's board has fully discussed each of the three CEO candidates and has unanimously agreed on the person who should succeed me if a replacement were needed today. The directors stay updated on this subject and could alter their view as circumstances change – new managerial stars may emerge and present ones will age. The important point is that the directors know now – and will always know in the future – exactly what they will do when the need arises.

The other question that must be addressed is whether the Board will be prepared to make a change if that need should arise not from my death but rather from my decay, particularly if this decay is accompanied by my delusionally thinking that I am reaching new peaks of managerial brilliance. That problem would not be unique to me. Charlie and I have faced this situation from time to time at Berkshire's subsidiaries. Humans age at greatly varying rates – but sooner or later their talents and vigor decline. Some managers remain effective well into their 80s – Charlie is a wonder at 82 – and others noticeably fade in their 60s. When their abilities ebb, so usually do their powers of self-assessment. Someone else often needs to blow the whistle.

When that time comes for me, our board will have to step up to the job. From a financial standpoint, its members are unusually motivated to do so. I know of no other board in the country in which the financial interests of directors are so completely aligned with those of shareholders. Few boards even come close. On a personal level, however, it is extraordinarily difficult for most people to tell someone, particularly a friend, that he or she is no longer capable.

If I become a candidate for that message, however, our board will be doing me a favor by delivering it. *Every* share of Berkshire that I own is destined to go to philanthropies, and I want society to reap the maximum good from these gifts and bequests. It would be a tragedy if the philanthropic potential of my holdings was diminished because my associates shirked their responsibility to (tenderly, I hope) show me the door. But don't worry about this. We have an outstanding group of directors, and they will always do what's right for shareholders.

And while we are on the subject, I feel terrific.

The Annual Meeting

Our meeting this year will be on Saturday, May 6. As always, the doors will open at the Qwest Center at 7 a.m., and the latest Berkshire movie will be shown at 8:30. At 9:30 we will go directly to the question-and-answer period, which (with a break for lunch at the Qwest's stands) will last until 3:00. Then, after a short recess, Charlie and I will convene the annual meeting at 3:15. This schedule worked well last year, because it let those who wanted to attend the formal session to do so, while freeing others to *shop*.

You certainly did your share in this respect last year. The 194,300 square foot hall adjoining the meeting area was filled with the products of Berkshire subsidiaries, and the 21,000 people who came to the meeting allowed every location to rack up sales records. Kelly Broz (neé Muchemore), the Flo Ziegfeld of Berkshire, orchestrates both this magnificent shopping extravaganza and the meeting itself. The exhibitors love her, and so do I. Kelly got married in October, and I gave her away. She asked me how I wanted to be listed in the wedding program. I replied "envious of the groom," and that's the way it went to press.

This year we will showcase two Clayton homes (featuring Acme brick, Shaw carpet, Johns Manville insulation, MiTek fasteners, Carefree awnings and NFM furniture). You will find that these homes, priced at $79,000 and $89,000, deliver excellent value. In fact, three shareholders came so firmly to that conclusion last year that they bought the $119,000 model we then showcased. Flanking the Clayton homes on the exhibition floor will be RVs from Forest River.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 45 of the 50 jurisdictions in which we operate. (One supplemental point: The discount is not additive if you qualify for another, such as that given certain groups.) Bring the details of your existing insurance and check out whether we can save you money. For at least 50% of you, I believe we can. And while you're at it, sign up for the new GEICO credit card. It's the one I now use.

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets® available for your inspection. Stop by the NetJets booth at the Qwest to learn about viewing these planes. Come to Omaha by bus; leave in your new plane.

The Bookworm boutique at the Qwest broke all records last year selling Berkshire-related books. An amazing 3,500 of these were *Poor Charlie's Almanack*, the collected wisdom of my partner. This means that a copy was sold every 9 seconds. And for good reason: You will never find a book with more useful ideas. Word-of-mouth recommendations have caused Charlie's first printing of 20,500 copies to sell out, and we will therefore have a revised and expanded edition on sale at our meeting. Among the other 22 titles and DVDs available last year at the Bookworm, 4,597 copies were sold for $84,746. Our shareholders are a bookseller's dream.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. Carol Pedersen, who handles these matters, does a terrific job for us each year, and I thank her for it.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" pricing. We initiated this special event at NFM nine years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $27.4 million in 2005 (up 9% from a year earlier). I get goose bumps just thinking about this volume.

To obtain the discount, you must make your purchases between Thursday, May 4 and Monday, May 8 inclusive, and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but that, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. Monday through Saturday, and 10 a.m. to 6 p.m. on Sunday. On Saturday this year, from 5:30 p.m. to 8 p.m., we are having a special affair for shareholders only. I'll be there, eating barbeque, drinking Coke, and counting sales.

Borsheim's again will have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, May 5. The second, the main gala, will be from 9 a.m. to 4 p.m. on Sunday, May 7. On Saturday, we will be open until 6 p.m.

We will have huge crowds at Borsheim's throughout the weekend. For your convenience, therefore, shareholder prices will be available from Monday, May 1 through Saturday, May 13. During that period, just identify yourself as a shareholder through your meeting credentials or a brokerage statement.

Borsheim's operates on a gross margin that, even before the shareholders' discount, is fully twenty percentage points below that of its major rivals. Last year, our shareholder-period business increased 9% from 2004, which came on top of a 73% gain the year before. The store sold 5,000 Berkshire Monopoly games – and then ran out. We've learned: Plenty will be in stock this year.

In a tent outside of Borsheim's, Patrick Wolff, twice U.S. chess champion, will take on all comers in groups of six – blindfolded. Additionally, we will have Bob Hamman and Sharon Osberg, two of the world's top bridge experts, available to play with our shareholders on Sunday afternoon. They plan to keep their eyes *open* – but Bob never sorts his cards, even when playing for a national championship.

Gorat's – my favorite steakhouse – will again be open exclusively for Berkshire shareholders on Sunday, May 7, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on that day, you must have a reservation. To make one, call 402-551-3733 on April 1 (*but not before*).

In this school year, about 35 university classes will come to Omaha for sessions with me. I take almost all – in aggregate, perhaps 2,000 students – to lunch at Gorat's. And they love it. To learn why, come join us on Sunday.

We will again have a special reception from 4:00 to 5:30 on Saturday afternoon for shareholders who have come from outside of North America. Every year our meeting draws many people from around the globe, and Charlie and I want to be sure we personally greet those who have come so far. Last year we enjoyed meeting more than 400 of you from many dozens of countries. Any shareholder who comes from other than the U.S. or Canada will be given a special credential and instructions for attending this function.

* * * * * * * * * * * *

Charlie and I are extraordinarily lucky. We were born in America; had terrific parents who saw that we got good educations; have enjoyed wonderful families and great health; and came equipped with a "business" gene that allows us to prosper in a manner hugely disproportionate to other people who contribute as much or more to our society's well-being. Moreover, we have long had jobs that we love, in which we are helped every day in countless ways by talented and cheerful associates. No wonder we tap-dance to work. But nothing is more fun for us than getting together with our shareholder-partners at Berkshire's annual meeting. So join us on May 6th at the Qwest for our annual Woodstock for Capitalists. We'll see you there.

February 28, 2006

Warren E. Buffett
Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
2001	(6.2)	(11.9)	5.7
2002	10.0	(22.1)	32.1
2003	21.0	28.7	(7.7)
2004	10.5	10.9	(.4)
2005	6.4	4.9	1.5
2006	18.4	15.8	2.6
Compounded Annual Gain – 1965-2006	21.4%	10.4%	11.0
Overall Gain – 1964-2006	361,156%	6,479%	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P 500 in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2006 was $16.9 billion, which increased the per-share book value of both our Class A and Class B stock by 18.4%. Over the last 42 years (that is, since present management took over) book value has grown from $19 to $70,281, a rate of 21.4% compounded annually.*

We believe that $16.9 billion is a record for a one-year gain in net worth – more than has ever been booked by *any* American business, leaving aside boosts that have occurred because of mergers (e.g., AOL's purchase of Time Warner). Of course, Exxon Mobil and other companies earn far more than Berkshire, but their earnings largely go to dividends and/or repurchases, rather than to building net worth.

All that said, a confession about our 2006 gain is in order. Our most important business, insurance, benefited from a large dose of luck: Mother Nature, bless her heart, went on vacation. After hammering us with hurricanes in 2004 and 2005 – storms that caused us to lose a bundle on super-cat insurance – she just vanished. Last year, the red ink from this activity turned black – *very* black.

In addition, the great majority of our 73 businesses did outstandingly well in 2006. Let me focus for a moment on one of our largest operations, GEICO. What management accomplished there was simply extraordinary.

As I've told you before, Tony Nicely, GEICO's CEO, went to work at the company 45 years ago, two months after turning 18. He became CEO in 1992, and from then on the company's growth exploded. In addition, Tony has delivered staggering productivity gains in recent years. Between yearend 2003 and yearend 2006, the number of GEICO policies increased from 5.7 million to 8.1 million, a jump of 42%. Yet during that same period, the company's employees (measured on a fulltime-equivalent basis) *fell* 3.5%. So productivity grew 47%. And GEICO didn't start fat.

That remarkable gain has allowed GEICO to maintain its all-important position as a low-cost producer, even though it has dramatically increased advertising expenditures. Last year GEICO spent $631 million on ads, up from $238 million in 2003 (and up from $31 million in 1995, when Berkshire took control). Today, GEICO spends far more on ads than any of its competitors, even those much larger. We will continue to raise the bar.

Last year I told you that if you had a new son or grandson to be sure to name him Tony. But Don Keough, a Berkshire director, recently had a better idea. After reviewing GEICO's performance in 2006, he wrote me, "Forget births. Tell the shareholders to immediately change the names of their *present* children to Tony or Antoinette." Don signed his letter "Tony."

* * * * * * * * * * * *

Charlie Munger – my partner and Berkshire's vice chairman – and I run what has turned out to be a big business, one with 217,000 employees and annual revenues approaching $100 billion. We certainly didn't plan it that way. Charlie began as a lawyer, and I thought of myself as a security analyst. Sitting in those seats, we both grew skeptical about the ability of big entities of any type to function well. Size seems to make many organizations slow-thinking, resistant to change and smug. In Churchill's words: "We shape our buildings, and afterwards our buildings shape us." Here's a telling fact: Of the ten non-oil companies having the largest market capitalization in 1965 – titans such as General Motors, Sears, DuPont and Eastman Kodak – only one made the 2006 list.

*****All per-share figures used in this report apply to Berkshire's A shares. Figures for the B shares are $1/30^{th}$ of those shown for the A.

In fairness, we've seen plenty of successes as well, some truly outstanding. There are many giant-company managers whom I greatly admire; Ken Chenault of American Express, Jeff Immelt of G.E. and Dick Kovacevich of Wells Fargo come quickly to mind. But I don't think I could do the management job they do. And I know I wouldn't enjoy many of the duties that come with their positions – meetings, speeches, foreign travel, the charity circuit and governmental relations. For me, Ronald Reagan had it right: "It's probably true that hard work never killed anyone – but why take the chance?"

So I've taken the easy route, just sitting back and working through great managers who run their own shows. My only tasks are to cheer them on, sculpt and harden our corporate culture, and make major capital-allocation decisions. Our managers have returned this trust by working hard and effectively.

For their performance over the last 42 years – and particularly for 2006 – Charlie and I thank them.

Yardsticks

Charlie and I measure Berkshire's progress and evaluate its intrinsic value in a number of ways. No single criterion is effective in doing these jobs, and even an avalanche of statistics will not capture some factors that are important. For example, it's essential that we have managers much younger than I available to succeed me. Berkshire has never been in better shape in this regard – but I can't prove it to you with numbers.

There are two statistics, however, that are of real importance. The first is the amount of investments (including cash and cash-equivalents) that we own on a per-share basis. Arriving at this figure, we exclude investments held in our finance operation because these are largely offset by borrowings. Here's the record since present management acquired control of Berkshire:

Year	Per-Share Investments*
1965	$ 4
1975	159
1985	2,407
1995	21,817
2006	$80,636
Compound Growth Rate 1965-2006	27.5%
Compound Growth Rate 1995-2006	12.6%

*Net of minority interests

In our early years we put most of our retained earnings and insurance float into investments in marketable securities. Because of this emphasis, and because the securities we purchased generally did well, our growth rate in investments was for a long time quite high.

Over the years, however, we have focused more and more on the acquisition of operating businesses. Using our funds for these purchases has both slowed our growth in investments and accelerated our gains in pre-tax earnings from non-insurance businesses, the second yardstick we use. Here's how those earnings have looked:

Year	Pre-Tax Earnings Per Share*
1965	$ 4
1975	4
1985	52
1995	175
2006	$3,625
Compound Growth Rate 1965-2006	17.9%
Compound Growth Rate 1995-2006	31.7%

*Excluding purchase-accounting adjustments and net of minority interests

Last year we had a good increase in non-insurance earnings – 38%. Large gains from here on in, though, will come only if we are able to make major, *and sensible*, acquisitions. That will not be easy. We do, however, have one advantage: More and more, Berkshire has become "the buyer of choice" for business owners and managers. Initially, we were viewed that way only in the U.S. (and more often than not by private companies). We've long wanted, nonetheless, to extend Berkshire's appeal beyond U.S. borders. And last year, our globe-trotting finally got underway.

Acquisitions

We began 2006 by completing the three acquisitions pending at yearend 2005, spending about $6 billion for PacifiCorp, Business Wire and Applied Underwriters. All are performing very well.

The highlight of the year, however, was our July 5th acquisition of most of ISCAR, an Israeli company, and our new association with its chairman, Eitan Wertheimer, and CEO, Jacob Harpaz. The story here began on October 25, 2005, when I received a 1¼-page letter from Eitan, of whom I then knew nothing. The letter began, "I am writing to introduce you to ISCAR," and proceeded to describe a cutting-tool business carried on in 61 countries. Then Eitan wrote, "We have for some time considered the issues of generational transfer and ownership that are typical for large family enterprises, and have given much thought to ISCAR's future. Our conclusion is that Berkshire Hathaway would be the ideal home for ISCAR. We believe that ISCAR would continue to thrive as a part of your portfolio of businesses."

Overall, Eitan's letter made the quality of the company and the character of its management leap off the page. It also made me want to learn more, and in November, Eitan, Jacob and ISCAR's CFO, Danny Goldman, came to Omaha. A few hours with them convinced me that if we were to make a deal, we would be teaming up with extraordinarily talented managers who could be trusted to run the business after a sale with all of the energy and dedication that they had exhibited previously. However, having never bought a business based outside of the U.S. (though I had bought a number of foreign stocks), I needed to get educated on some tax and jurisdictional matters. With that task completed, Berkshire purchased 80% of ISCAR for $4 billion. The remaining 20% stays in the hands of the Wertheimer family, making it our valued partner.

ISCAR's products are small, consumable cutting tools that are used in conjunction with large and expensive machine tools. It's a business without magic except for that imparted by the people who run it. But Eitan, Jacob and their associates are true managerial magicians who constantly develop tools that make their customers' machines more productive. The result: ISCAR makes money because it enables its customers to make *more* money. There is no better recipe for continued success.

In September, Charlie and I, along with five Berkshire associates, visited ISCAR in Israel. We – and I mean every one of us – have never been more impressed with any operation. At ISCAR, as throughout Israel, brains and energy are ubiquitous. Berkshire shareholders are lucky to have joined with Eitan, Jacob, Danny and their talented associates.

* * * * * * * * * * * *

A few months later, Berkshire again became "the buyer of choice" in a deal brought to us by my friend, John Roach, of Fort Worth. John, many of you will remember, was Chairman of Justin Industries, which we bought in 2000. At that time John was helping John Justin, who was terminally ill, find a permanent home for his company. John Justin died soon after we bought Justin Industries, but it has since been run exactly as we promised him it would be.

Visiting me in November, John Roach brought along Paul Andrews, Jr., owner of about 80% of TTI, a Fort Worth distributor of electronic components. Over a 35-year period, Paul built TTI from $112,000 of sales to $1.3 billion. He is a remarkable entrepreneur and operator.

Paul, 64, loves running his business. But not long ago he happened to witness how disruptive the death of a founder can be both to a private company's employees and the owner's family. What starts out as disruptive, furthermore, often evolves into destructive. About a year ago, therefore, Paul began to think about selling TTI. His goal was to put his business in the hands of an owner he had carefully chosen, rather than allowing a trust officer or lawyer to conduct an auction after his death.

Paul rejected the idea of a "strategic" buyer, knowing that in the pursuit of "synergies," an owner of that type would be apt to dismantle what he had so carefully built, a move that would uproot hundreds of his associates (and perhaps wound TTI's business in the process). He also ruled out a private equity firm, which would very likely load the company with debt and then flip it as soon as possible.

That left Berkshire. Paul and I met on the morning of November 15th and made a deal before lunch. Later he wrote me: "After our meeting, I am confident that Berkshire is the right owner for TTI . . . I am proud of our past and excited about our future." And so are Charlie and I.

* * * * * * * * * * * *

We also made some "tuck-in" acquisitions during 2006 at Fruit of the Loom ("Fruit"), MiTek, CTB, Shaw and Clayton. Fruit made the largest purchases. First, it bought Russell Corp., a leading producer of athletic apparel and uniforms for about $1.2 billion (including assumed debt) and in December it agreed to buy the intimate apparel business of VF Corp. Together, these acquisitions add about $2.2 billion to Fruit's sales and bring with them about 23,000 employees.

Charlie and I love it when we can acquire businesses that can be placed under managers, such as John Holland at Fruit, who have already shown their stuff at Berkshire. MiTek, for example, has made 14 acquisitions since we purchased it in 2001, and Gene Toombs has delivered results from these deals far in excess of what he had predicted. In effect, we leverage the managerial talent already with us by these tuck-in deals. We will make many more.

* * * * * * * * * * * *

We continue, however, to need "elephants" in order for us to use Berkshire's flood of incoming cash. Charlie and I must therefore ignore the pursuit of mice and focus our acquisition efforts on much bigger game.

Our exemplar is the older man who crashed his grocery cart into that of a much younger fellow while both were shopping. The elderly man explained apologetically that he had lost track of his wife and was preoccupied searching for her. His new acquaintance said that by coincidence his wife had also wandered off and suggested that it might be more efficient if they jointly looked for the two women. Agreeing, the older man asked his new companion what his wife looked like. "She's a gorgeous blonde," the fellow answered, "with a body that would cause a bishop to go through a stained glass window, and she's wearing tight white shorts. How about yours?" The senior citizen wasted no words: "Forget her, we'll look for yours."

What *we* are looking for is described on page 25. If you have an acquisition candidate that fits, call me – day or night. And then watch me shatter a stained glass window.

* * * * * * * * * * * *

Now, let's examine the four major operating sectors of Berkshire. Lumping their financial figures together impedes analysis. So we'll look at them as four separate businesses, starting with the all–important insurance group.

Insurance

Next month marks the 40th anniversary of our entrance into the insurance business. It was on March 9, 1967, that Berkshire purchased National Indemnity and its companion company, National Fire & Marine, from Jack Ringwalt for $8.6 million.

Jack was a long-time friend of mine and an excellent, but somewhat eccentric, businessman. For about ten minutes every year he would get the urge to sell his company. But those moods – perhaps brought on by a tiff with regulators or an unfavorable jury verdict – quickly vanished.

In the mid-1960s, I asked investment banker Charlie Heider, a mutual friend of mine and Jack's, to alert me the next time Jack was "in heat." When Charlie's call came, I sped to meet Jack. We made a deal in a few minutes, with me waiving an audit, "due diligence" or anything else that would give Jack an opportunity to reconsider. We just shook hands, and that was that.

When we were due to close the purchase at Charlie's office, Jack was late. Finally arriving, he explained that he had been driving around looking for a parking meter with some unexpired time. That was a magic moment for me. I knew then that Jack was going to be my kind of manager.

When Berkshire purchased Jack's two insurers, they had "float" of $17 million. We've regularly offered a long explanation of float in earlier reports, which you can read on our website. Simply put, float is money we hold that is not ours but which we get to invest.

At the end of 2006, our float had grown to $50.9 billion, and we have since written a huge retroactive reinsurance contract with Equitas – which I will describe in the next section – that boosts float by another $7 billion. Much of the gain we've made has come through our acquisition of other insurers, but we've also had outstanding internal growth, particularly at Ajit Jain's amazing reinsurance operation. Naturally, I had no notion in 1967 that our float would develop as it has. There's much to be said for just putting one foot in front of the other every day.

The float from retroactive reinsurance contracts, of which we have many, automatically drifts down over time. Therefore, it will be difficult for us to increase float in the future unless we make new acquisitions in the insurance field. Whatever its size, however, the all-important *cost* of Berkshire's float over time is likely to be significantly below that of the industry, perhaps even falling to less than zero. Note the words "over time." There will be bad years periodically. You can be sure of that.

In 2006, though, everything went right in insurance – *really* right. Our managers – Tony Nicely (GEICO), Ajit Jain (B-H Reinsurance), Joe Brandon and Tad Montross (General Re), Don Wurster (National Indemnity Primary), Tom Nerney (U.S. Liability), Tim Kenesey (Medical Protective), Rod Eldred (Homestate Companies and Cypress), Sid Ferenc and Steve Menzies (Applied Underwriters), John Kizer (Central States) and Don Towle (Kansas Bankers Surety) – simply shot the lights out. When I recite their names, I feel as if I'm at Cooperstown, reading from the Hall of Fame roster. Of course, the overall insurance industry also had a terrific year in 2006. But our managers delivered results generally superior to those of their competitors.

Below is the tally on our underwriting and float for each major sector of insurance. Enjoy the view, because you won't soon see another like it.

	(in $ millions)			
	Underwriting Profit (Loss)		*Yearend Float*	
Insurance Operations	*2006*	*2005*	*2006*	*2005*
General Re	$ 526	$(334)	$22,827	$22,920
B-H Reinsurance	1,658	(1,069)	16,860	16,233
GEICO	1,314	1,221	7,171	6,692
Other Primary	340**	235*	4,029	3,442
Total	$3,838	$ 53	$50,887	$49,287

* Includes MedPro from June 30, 2005.

** Includes Applied Underwriters from May 19, 2006.

* * * * * * * * * * * *

In 2007, our results from the bread-and-butter lines of insurance will deteriorate, though I think they will remain satisfactory. The big unknown is super-cat insurance. Were the terrible hurricane seasons of 2004-05 aberrations? Or were they our planet's first warning that the climate of the 21st Century will differ materially from what we've seen in the past? If the answer to the second question is yes, 2006 will soon be perceived as a misleading period of calm preceding a series of devastating storms. These could rock the insurance industry. It's naïve to think of Katrina as anything close to a worst-case event.

Neither Ajit Jain, who manages our super-cat operation, nor I know what lies ahead. We do know that it would be a huge mistake to bet that evolving atmospheric changes are benign in their implications for insurers.

Don't think, however, that we have lost our taste for risk. We remain prepared to lose $6 billion in a single event, *if* we have been paid appropriately for assuming that risk. We are not willing, though, to take on even very small exposures at prices that don't reflect our evaluation of loss probabilities. Appropriate prices don't guarantee profits in any given year, but inappropriate prices most certainly guarantee eventual losses. Rates have recently fallen because a flood of capital has entered the super-cat field. We have therefore sharply reduced our wind exposures. Our behavior here parallels that which we employ in financial markets: Be fearful when others are greedy, and be greedy when others are fearful.

Lloyd's, Equitas and Retroactive Reinsurance

Last year – we are getting now to Equitas – Berkshire agreed to enter into a huge retroactive reinsurance contract, a policy that protects an insurer against losses that have already happened, but whose cost is not yet known. I'll give you details of the agreement shortly. But let's first take a journey through insurance history, following the route that led to our deal.

Our tale begins around 1688, when Edward Lloyd opened a small coffee house in London. Though no Starbucks, his shop was destined to achieve worldwide fame because of the commercial activities of its clientele – shipowners, merchants and venturesome British capitalists. As these parties sipped Edward's brew, they began to write contracts transferring the risk of a disaster at sea from the owners of ships and their cargo to the capitalists, who wagered that a given voyage would be completed without incident. These capitalists eventually became known as "underwriters at Lloyd's."

Though many people believe Lloyd's to be an insurance company, that is not the case. It is instead a *place* where many member-insurers transact business, just as they did centuries ago.

Over time, the underwriters solicited passive investors to join in syndicates. Additionally, the business broadened beyond marine risks into every imaginable form of insurance, including exotic coverages that spread the fame of Lloyd's far and wide. The underwriters left the coffee house, found grander quarters and formalized some rules of association. And those persons who passively backed the underwriters became known as "names."

Eventually, the names came to include many thousands of people from around the world, who joined expecting to pick up some extra change without effort or serious risk. True, prospective names were always solemnly told that they would have unlimited and everlasting liability for the consequences of their syndicate's underwriting – "down to the last cufflink," as the quaint description went. But that warning came to be viewed as perfunctory. Three hundred years of retained cufflinks acted as a powerful sedative to the names poised to sign up.

Then came asbestos. When its prospective costs were added to the tidal wave of environmental and product claims that surfaced in the 1980s, Lloyd's began to implode. Policies written decades earlier – and largely forgotten about – were developing huge losses. No one could intelligently estimate their total, but it was certain to be many tens of billions of dollars. The specter of unending and unlimited losses terrified existing names and scared away prospects. Many names opted for bankruptcy; some even chose suicide.

From these shambles, there came a desperate effort to resuscitate Lloyd's. In 1996, the powers that be at the institution allotted £11.1 billion to a new company, Equitas, and made it responsible for paying all claims on policies written before 1993. In effect, this plan pooled the misery of the many syndicates in trouble. Of course, the money allotted could prove to be insufficient – and if that happened, the names remained liable for the shortfall.

But the new plan, by concentrating all of the liabilities in one place, had the advantage of eliminating much of the costly intramural squabbling that went on among syndicates. Moreover, the pooling allowed claims evaluation, negotiation and litigation to be handled more intelligently than had been the case previously. Equitas embraced Ben Franklin's thinking: "We must all hang together, or assuredly we shall hang separately."

From the start, many people predicted Equitas would eventually fail. But as Ajit and I reviewed the facts in the spring of 2006 – 13 years after the last exposed policy had been written and after the payment of £11.3 billion in claims – we concluded that the patient was likely to survive. And so we decided to offer a huge reinsurance policy to Equitas.

Because plenty of imponderables continue to exist, Berkshire could not provide Equitas, and its 27,972 names, unlimited protection. But we said – and I'm simplifying – that if Equitas would give us $7.12 billion in cash and securities (this is the float I spoke about), we would pay all of its future claims and expenses up to $13.9 billion. That amount was $5.7 billion above what Equitas had recently guessed its ultimate liabilities to be. Thus the names received a huge – and almost certainly sufficient – amount of future protection against unpleasant surprises. Indeed the protection is so large that Equitas plans a cash payment to its thousands of names, an event few of them had ever dreamed possible.

And how will Berkshire fare? That depends on how much "known" claims will end up costing us, how many yet-to-be-presented claims will surface and what they will cost, how soon claim payments will be made and how much we earn on the cash we receive before it must be paid out. Ajit and I think the odds are in our favor. And should we be wrong, Berkshire can handle it.

Scott Moser, the CEO of Equitas, summarized the transaction neatly: "Names wanted to sleep easy at night, and we think we've just bought them the world's best mattress."

* * * * * * * * * * *

Warning: It's time to eat your broccoli – I am now going to talk about accounting matters. I owe this to those Berkshire shareholders who love reading about debits and credits. I hope both of you find this discussion helpful. All others can skip this section; there will be no quiz.

Berkshire has done many retroactive transactions – in both number and amount a multiple of such policies entered into by any other insurer. We are the reinsurer of choice for these coverages because the obligations that are transferred to us – for example, lifetime indemnity and medical payments to be made to injured workers – may not be fully satisfied for 50 years or more. No other company can offer the certainty

that Berkshire can, in terms of guaranteeing the full and fair settlement of these obligations. This fact is important to the original insurer, policyholders and regulators.

The accounting procedure for retroactive transactions is neither well known nor intuitive. The best way for shareholders to understand it, therefore, is for us to simply lay out the debits and credits. Charlie and I would like to see this done more often. We sometimes encounter accounting footnotes about important transactions that leave us baffled, and we go away suspicious that the reporting company wished it that way. (For example, try comprehending transactions "described" in the old 10-Ks of Enron, even after you *know* how the movie ended.)

So let us summarize our accounting for the Equitas transaction. The major debits will be to Cash and Investments, Reinsurance Recoverable, and Deferred Charges for Reinsurance Assumed ("DCRA"). The major credit will be to Reserve for Losses and Loss Adjustment Expense. No profit or loss will be recorded at the inception of the transaction, but underwriting losses will thereafter be incurred annually as the DCRA asset is amortized downward. The amount of the annual amortization charge will be primarily determined by how our end-of-the-year estimates as to the timing and amount of future loss payments compare to the estimates made at the beginning of the year. Eventually, when the last claim has been paid, the DCRA account will be reduced to zero. That day is 50 years or more away.

What's important to remember is that retroactive insurance contracts always produce underwriting losses for us. Whether these losses are worth experiencing depends on whether the cash we have received produces investment income that exceeds the losses. Recently our DCRA charges have annually delivered $300 million or so of underwriting losses, which have been more than offset by the income we have realized through use of the cash we received as a premium. Absent new retroactive contracts, the amount of the annual charge would normally decline over time. After the Equitas transaction, however, the annual DCRA cost will initially increase to about $450 million a year. This means that our other insurance operations must generate at least that much underwriting gain for our overall float to be cost-free. That amount is quite a hurdle but one that I believe we will clear in many, if not most, years.

Aren't you glad that I promised you there would be no quiz?

Manufacturing, Service and Retailing Operations

Our activities in this part of Berkshire cover the waterfront. Let's look, though, at a summary balance sheet and earnings statement for the entire group.

Balance Sheet 12/31/06 (in millions)

Assets		*Liabilities and Equity*	
Cash and equivalents	$ 1,543	Notes payable	$ 1,468
Accounts and notes receivable	3,793	Other current liabilities	6,635
Inventory	5,257	Total current liabilities	8,103
Other current assets	363		
Total current assets	10,956		
Goodwill and other intangibles	13,314	Deferred taxes	540
Fixed assets	8,934	Term debt and other liabilities	3,014
Other assets	1,168	Equity	22,715
	$34,372		$34,372

Earnings Statement (in millions)

	2006	*2005*	*2004*
Revenues	$52,660	$46,896	$44,142
Operating expenses (including depreciation of $823 in 2006, $699 in 2005 and $676 in 2004)	49,002	44,190	41,604
Interest expense	132	83	57
Pre-tax earnings	3,526*	2,623*	2,481*
Income taxes and minority interests	1,395	977	941
Net income	$ 2,131	$ 1,646	$ 1,540

*Does not include purchase-accounting adjustments.

This motley group, which sells products ranging from lollipops to motor homes, earned a pleasing 25% on average tangible net worth last year. It's noteworthy also that these operations used only minor financial leverage in achieving that return. Clearly we own some terrific businesses. We purchased many of them, however, at large premiums to net worth – a point reflected in the goodwill item shown on the balance sheet – and that fact reduces the earnings on our average *carrying* value to 10.8%.

Here are a few newsworthy items about companies in this sector:

- Bob Shaw, a remarkable entrepreneur who from a standing start built Shaw Industries into the country's largest carpet producer, elected last year, at age 75, to retire. To succeed him, Bob recommended Vance Bell, a 31-year veteran at Shaw, and Bob, as usual, made the right call. Weakness in housing has caused the carpet business to slow. Shaw, however, remains a powerhouse and a major contributor to Berkshire's earnings.

- MiTek, a manufacturer of connectors for roof trusses at the time we purchased it in 2001, is developing into a mini-conglomerate. At the rate it is growing, in fact, "mini" may soon be inappropriate. In purchasing MiTek for $420 million, we lent the company $200 million at 9% and bought $198 million of stock, priced at $10,000 per share. Additionally, 55 employees bought 2,200 shares for $22 million. Each employee paid *exactly* the same price that we did, in most cases borrowing money to do so.

  And are they ever glad they did! Five years later, MiTek's sales have tripled and the stock is valued at $71,699 per share. Despite its making 14 acquisitions, at a cost of $291 million, MiTek has paid off its debt to Berkshire and holds $35 million of cash. We celebrated the fifth anniversary of our purchase with a party in July. I told the group that it would be embarrassing if MiTek's stock price soared beyond that of Berkshire "A" shares. Don't be surprised, however, if that happens (though Charlie and I will try to make our shares a moving target).

- Not all of our businesses are destined to increase profits. When an industry's underlying economics are crumbling, talented management may slow the rate of decline. Eventually, though, eroding fundamentals will overwhelm managerial brilliance. (As a wise friend told me long ago, "If you want to get a reputation as a good businessman, be sure to get into a good business.") And fundamentals are definitely eroding in the newspaper industry, a trend that has caused the profits of our Buffalo News to decline. The skid will almost certainly continue.

  When Charlie and I were young, the newspaper business was as easy a way to make huge returns as existed in America. As one not-too-bright publisher famously said, "I owe my fortune to two great American institutions: monopoly and nepotism." No paper in a one-paper city, however bad the product or however inept the management, could avoid gushing profits.

  The industry's staggering returns could be simply explained. For most of the 20th Century, newspapers were the primary source of information for the American public. Whether the subject was sports, finance, or politics, newspapers reigned supreme. Just as important, their ads were the easiest way to find job opportunities or to learn the price of groceries at your town's supermarkets.

The great majority of families therefore felt the need for a paper every day, but understandably most didn't wish to pay for two. Advertisers preferred the paper with the most circulation, and readers tended to want the paper with the most ads and news pages. This circularity led to a law of the newspaper jungle: Survival of the Fattest.

Thus, when two or more papers existed in a major city (which was almost universally the case a century ago), the one that pulled ahead usually emerged as the stand-alone winner. After competition disappeared, the paper's pricing power in both advertising and circulation was unleashed. Typically, rates for both advertisers and readers would be raised annually – and the profits rolled in. For owners this was economic heaven. (Interestingly, though papers regularly – and often in a disapproving way – reported on the profitability of, say, the auto or steel industries, they never enlightened readers about their own Midas-like situation. Hmmm . . .)

As long ago as my 1991 letter to shareholders, I nonetheless asserted that this insulated world was changing, writing that "the media businesses . . . will prove considerably less marvelous than I, the industry, or lenders thought would be the case only a few years ago." Some publishers took umbrage at both this remark and other warnings from me that followed. Newspaper properties, moreover, continued to sell as if they were indestructible slot machines. In fact, many intelligent newspaper executives who regularly chronicled and analyzed important worldwide events were either blind or indifferent to what was going on under their noses.

Now, however, almost all newspaper owners realize that they are constantly losing ground in the battle for eyeballs. Simply put, if cable and satellite broadcasting, as well as the internet, had come along first, newspapers as we know them probably would never have existed.

In Berkshire's world, Stan Lipsey does a terrific job running the Buffalo News, and I am enormously proud of its editor, Margaret Sullivan. The News' penetration of its market is the highest among that of this country's large newspapers. We also do better financially than most metropolitan newspapers, even though Buffalo's population and business trends are not good. Nevertheless, this operation faces unrelenting pressures that will cause profit margins to slide.

True, we have the leading online news operation in Buffalo, and it will continue to attract more viewers and ads. However, the economic potential of a newspaper internet site – given the many alternative sources of information and entertainment that are free and only a click away – is at best a small fraction of that existing in the past for a print newspaper facing no competition.

For a local resident, ownership of a city's paper, like ownership of a sports team, still produces instant prominence. With it typically comes power and influence. These are ruboffs that appeal to many people with money. Beyond that, civic-minded, wealthy individuals may feel that local ownership will serve their community well. That's why Peter Kiewit bought the Omaha paper more than 40 years ago.

We are likely therefore to see non-economic individual buyers of newspapers emerge, just as we have seen such buyers acquire major sports franchises. Aspiring press lords should be careful, however: There's no rule that says a newspaper's revenues can't fall below its expenses and that losses can't mushroom. Fixed costs are high in the newspaper business, and that's bad news when unit volume heads south. As the importance of newspapers diminishes, moreover, the "psychic" value of possessing one will wane, whereas owning a sports franchise will likely retain its cachet.

Unless we face an irreversible cash drain, we will stick with the News, just as we've said that we would. (Read economic principle 11, on page 76.) Charlie and I love newspapers – we each read five a day – and believe that a free and energetic press is a key ingredient for maintaining a great democracy. We hope that some combination of print and online will ward off economic doomsday for newspapers, and we will work hard in Buffalo to develop a sustainable business model. I think we will be successful. But the days of lush profits from our newspaper are over.

- A *much* improved situation is emerging at NetJets, which sells and manages fractionally-owned aircraft. This company has never had a problem growing: Revenues from flight operations have increased 596% since our purchase in 1998. But profits had been erratic.

  Our move to Europe, which began in 1996, was particularly expensive. After five years of operation there, we had acquired only 80 customers. And by mid-year 2006 our cumulative pre-tax loss had risen to $212 million. But European demand has now exploded, with a net of 589 customers having been added in 2005-2006. Under Mark Booth's brilliant leadership, NetJets is now operating profitably in Europe, and we expect the positive trend to continue.

  Our U.S. operation also had a good year in 2006, which led to worldwide pre-tax earnings of $143 million at NetJets last year. We made this profit even though we suffered a loss of $19 million in the first quarter.

  Credit Rich Santulli, along with Mark, for this turnaround. Rich, like many of our managers, has no financial need to work. But you'd never know it. He's absolutely tireless – monitoring operations, making sales, and traveling the globe to constantly widen the already-enormous lead that NetJets enjoys over its competitors. Today, the value of the fleet we manage is far greater than that managed by our three largest competitors *combined*.

  There's a reason NetJets is the runaway leader: It offers the ultimate in safety and service. At Berkshire, and at a number of our subsidiaries, NetJets aircraft are an indispensable business tool. I also have a contract for personal use with NetJets and so do members of my family and most Berkshire directors. (None of us, I should add, gets a discount.) Once you've flown NetJets, returning to commercial flights is like going back to holding hands.

Regulated Utility Business

Berkshire has an 86.6% (fully diluted) interest in MidAmerican Energy Holdings, which owns a wide variety of utility operations. The largest of these are (1) Yorkshire Electricity and Northern Electric, whose 3.7 million electric customers make it the third largest distributor of electricity in the U.K.; (2) MidAmerican Energy, which serves 706,000 electric customers, primarily in Iowa; (3) Pacific Power and Rocky Mountain Power, serving about 1.7 million electric customers in six western states; and (4) Kern River and Northern Natural pipelines, which carry about 8% of the natural gas consumed in the U.S.

Our partners in ownership of MidAmerican are Walter Scott, and its two terrific managers, Dave Sokol and Greg Abel. It's unimportant how many votes each party has; we will make major moves only when we are unanimous in thinking them wise. Six years of working with Dave, Greg and Walter have underscored my original belief: Berkshire couldn't have better partners.

Somewhat incongruously, MidAmerican owns the second largest real estate brokerage firm in the U.S., HomeServices of America. This company operates through 20 locally-branded firms with 20,300 agents. Despite HomeServices' purchase of two operations last year, the company's overall volume fell 9% to $58 billion, and profits fell 50%.

The slowdown in residential real estate activity stems in part from the weakened lending practices of recent years. The "optional" contracts and "teaser" rates that have been popular have allowed borrowers to make payments in the early years of their mortgages that fall far short of covering normal interest costs. Naturally, there are few defaults when virtually nothing is required of a borrower. As a cynic has said, "A rolling loan gathers no loss." But payments *not* made add to principal, and borrowers who can't afford normal monthly payments early on are hit later with *above-normal* monthly obligations. This is the Scarlett O'Hara scenario: "I'll think about that tomorrow." For many home owners, "tomorrow" has now arrived. Consequently there is a huge overhang of offerings in several of HomeServices' markets.

Nevertheless, we will be seeking to purchase additional brokerage operations. A decade from now, HomeServices will almost certainly be much larger.

Here are some key figures on MidAmerican's operations:

	Earnings (in $ millions)	
	2006	*2005*
U.K. utilities	$ 338	$ 308
Iowa utility	348	288
Western utilities (acquired March 21, 2006)	356	N/A
Pipelines	376	309
HomeServices	74	148
Other (net)	226	115
Earnings before corporate interest and taxes	1,718	1,168
Interest, other than to Berkshire	(261)	(200)
Interest on Berkshire junior debt	(134)	(157)
Income tax	(407)	(248)
Net earnings	$ 916	$ 563
Earnings applicable to Berkshire*	$ 885	$ 523
Debt owed to others	16,946	10,296
Debt owed to Berkshire	1,055	1,289

*Includes interest earned by Berkshire (net of related income taxes) of $87 in 2006 and $102 in 2005.

Finance and Financial Products

You will be happy to hear – and I'm even happier – that this will be my last discussion of the losses at Gen Re's derivative operation. When we started to wind this business down early in 2002, we had 23,218 contracts outstanding. Now we have 197. Our cumulative pre-tax loss from this operation totals $409 million, but only $5 million occurred in 2006. Charlie says that if we had properly classified the $409 million on our 2001 balance sheet, it would have been labeled "Good Until Reached For." In any event, a Shakespearean thought – slightly modified – seems appropriate for the tombstone of this derivative business: "All's well that ends."

We've also wound up our investment in Value Capital. So earnings or losses from these two lines of business are making their final appearance in the table that annually appears in this section.

Clayton Homes remains an anomaly in the manufactured-housing industry, which last year recorded its lowest unit sales since 1962. Indeed, the industry's volume last year was only about one-third that of 1999. Outside of Clayton, I doubt if the industry, overall, made *any* money in 2006.

Yet Clayton earned $513 million pre-tax and paid Berkshire an additional $86 million as a fee for our obtaining the funds to finance Clayton's $10 billion portfolio of installment receivables. Berkshire's financial strength has clearly been of huge help to Clayton. But the driving force behind the company's success is Kevin Clayton. Kevin knows the business forward and backward, is a rational decision-maker and a joy to work with. Because of acquisitions, Clayton now employs 14,787 people, compared to 6,661 at the time of our purchase.

We have two leasing operations: CORT (furniture), run by Paul Arnold, and XTRA (truck trailers), run by Bill Franz. CORT's earnings improved significantly last year, and XTRA's remained at the high level attained in 2005. We continue to look for tuck-in acquisitions to be run by Paul or Bill, and also are open to ideas for new leasing opportunities.

Here's a breakdown of earnings in this sector:

	(in millions)			
	Pre-Tax Earnings		*Interest-Bearing Liabilities*	
	2006	*2005*	*2006*	*2005*
Trading – ordinary income	$ 274	$ 200	$ 600	$1,061
Gen Re Securities (loss)	(5)	(104)	1,204*	2,617*
Life and annuity operation	29	11	2,459	2,461
Value Capital (loss)	6	(33)	N/A	N/A
Leasing operations	182	173	261	370
Manufactured-housing finance (Clayton)	513	416	10,498	9,299
Other	158	159	N/A	N/A
Income before capital gains	1,157	822		
Trading – capital gains (losses)	938	(234)		
Total	$ 2,095	$ 588		

*Includes all liabilities

Investments

We show below our common stock investments. With two exceptions, those that had a market value of more than $700 million at the end of 2006 are itemized. We don't itemize the two securities referred to, which have a market value of $1.9 billion, because we continue to buy them. I could, of course, tell you their names. But then I would have to kill you.

			12/31/06	
Shares	*Company*	*Percentage of Company Owned*	*Cost**	*Market*
			(in millions)	
151,610,700	American Express Company	12.6	$ 1,287	$ 9,198
36,417,400	Anheuser-Busch Cos., Inc.	4.7	1,761	1,792
200,000,000	The Coca-Cola Company	8.6	1,299	9,650
17,938,100	Conoco Phillips	1.1	1,066	1,291
21,334,900	Johnson & Johnson	0.7	1,250	1,409
6,708,760	M&T Bank Corporation	6.1	103	820
48,000,000	Moody's Corporation	17.2	499	3,315
2,338,961,000	PetroChina "H" shares (or equivalents)	1.3	488	3,313
3,486,006	POSCO	4.0	572	1,158
100,000,000	The Procter & Gamble Company	3.2	940	6,427
229,707,000	Tesco	2.9	1,340	1,820
31,033,800	US Bancorp	1.8	969	1,123
17,072,192	USG Corp	19.0	536	936
19,944,300	Wal-Mart Stores, Inc.	0.5	942	921
1,727,765	The Washington Post Company	18.0	11	1,288
218,169,300	Wells Fargo & Company	6.5	3,697	7,758
1,724,200	White Mountains Insurance	16.0	369	999
	Others		5,866	8,315
	Total Common Stocks		$22,995	$61,533

*This is our actual purchase price and also our tax basis; GAAP "cost" differs in a few cases because of write-ups or write-downs that have been required.

We are delighted by the 2006 business performance of virtually all of our investees. Last year, we told you that our expectation was that these companies, in aggregate, would increase their earnings by 6% to 8% annually, a rate that would double their earnings every ten years or so. In 2006 American Express,

Coca-Cola, Procter & Gamble and Wells Fargo, our largest holdings, increased per-share earnings by 18%, 9%, 8% and 11%. These are stellar results, and we thank their CEOs.

* * * * * * * * * * * *

We've come close to eliminating our direct foreign-exchange position, from which we realized about $186 million in pre-tax profits in 2006 (earnings that were included in the Finance and Financial Products table shown earlier). That brought our total gain since inception of this position in 2002 to $2.2 billion. Here's a breakdown by currency:

Total Gain (Loss) in Millions

Australian dollar	$247.1	Mexican peso	$106.1
British pound	287.2	New Zealand dollar	102.6
Canadian dollar	398.3	Singapore dollar	(2.6)
Chinese yuan	(12.7)	South Korean won	261.3
Euro	839.2	Swiss franc	9.6
Hong Kong dollar	(2.5)	Taiwan dollar	(45.3)
Japanese yen	1.9	Miscellaneous options	22.9

We've made large indirect currency profits as well, though I've never tallied the precise amount. For example, in 2002-2003 we spent about $82 million buying – of all things – Enron bonds, some of which were denominated in Euros. Already we've received distributions of $179 million from these bonds, and our remaining stake is worth $173 million. That means our overall gain is $270 million, part of which came from the appreciation of the Euro that took place after our bond purchase.

When we first began making foreign exchange purchases, interest-rate differentials between the U.S. and most foreign countries favored a direct currency position. But that spread turned negative in 2005. We therefore looked for other ways to gain foreign-currency exposure, such as the ownership of foreign equities or of U.S. stocks with major earnings abroad. The currency factor, we should emphasize, is not dominant in our selection of equities, but is merely one of many considerations.

As our U.S. trade problems worsen, the probability that the dollar will weaken over time continues to be high. I fervently believe in *real* trade – the more the better for both us and the world. We had about $1.44 trillion of this honest-to-God trade in 2006. But the U.S. also had $.76 trillion of *pseudo*-trade last year – imports for which we exchanged no goods or services. (Ponder, for a moment, how commentators would describe the situation if our imports were $.76 trillion – a full 6% of GDP – and we had *no* exports.) Making these purchases that weren't reciprocated by sales, the U.S. necessarily transferred ownership of its assets or IOUs to the rest of the world. Like a very wealthy but self-indulgent family, we peeled off a bit of what we owned in order to consume more than we produced.

The U.S. can do a lot of this because we are an extraordinarily rich country that has behaved responsibly in the past. The world is therefore willing to accept our bonds, real estate, stocks and businesses. And we have a vast store of these to hand over.

These transfers will have consequences, however. Already the prediction I made last year about one fall-out from our spending binge has come true: The "investment income" account of our country – positive in every previous year since *1915* – turned negative in 2006. Foreigners now earn more on their U.S. investments than we do on our investments abroad. In effect, we've used up our bank account and turned to our credit card. And, like everyone who gets in hock, the U.S. will now experience "reverse compounding" as we pay ever-increasing amounts of interest on interest.

I want to emphasize that even though our course is unwise, Americans will live better ten or twenty years from now than they do today. Per-capita wealth will increase. But our citizens will also be forced every year to ship a significant portion of their current production abroad merely to service the cost of our huge debtor position. It won't be pleasant to work part of each day to pay for the over-consumption

of your ancestors. I believe that at some point in the future U.S. workers and voters will find this annual "tribute" so onerous that there will be a severe political backlash. How that will play out in markets is impossible to predict – but to expect a "soft landing" seems like wishful thinking.

* * * * * * * * * * * *

I should mention that all of the direct currency profits we have realized have come from forward contracts, which are derivatives, and that we have entered into other types of derivatives contracts as well. That may seem odd, since you know of our expensive experience in unwinding the derivatives book at Gen Re and also have heard me talk of the systemic problems that could result from the enormous growth in the use of derivatives. Why, you may wonder, are we fooling around with such potentially toxic material?

The answer is that derivatives, just like stocks and bonds, are sometimes wildly mispriced. For many years, accordingly, we have selectively written derivative contracts – few in number but sometimes for large dollar amounts. We currently have 62 contracts outstanding. I manage them personally, and they are free of counterparty credit risk. So far, these derivative contracts have worked out well for us, producing pre-tax profits in the hundreds of millions of dollars (above and beyond the gains I've itemized from forward foreign-exchange contracts). Though we will experience losses from time to time, we are likely to continue to earn – overall – significant profits from mispriced derivatives.

* * * * * * * * * * * *

I have told you that Berkshire has three outstanding candidates to replace me as CEO and that the Board knows exactly who should take over if I should die tonight. Each of the three is much younger than I. The directors believe it's important that my successor have the prospect of a long tenure.

Frankly, we are not as well-prepared on the investment side of our business. There's a history here: At one time, Charlie was my potential replacement for investing, and more recently Lou Simpson has filled that slot. Lou is a top-notch investor with an outstanding long-term record of managing GEICO's equity portfolio. But he is only six years younger than I. If I were to die soon, he would fill in magnificently for a short period. For the long-term, though, we need a different answer.

At our October board meeting, we discussed that subject fully. And we emerged with a plan, which I will carry out with the help of Charlie and Lou.

Under this plan, I intend to hire a younger man or woman with the potential to manage a very large portfolio, who we hope will succeed me as Berkshire's chief investment officer when the need for someone to do that arises. As part of the selection process, we may in fact take on several candidates.

Picking the right person(s) will not be an easy task. It's not hard, of course, to find smart people, among them individuals who have impressive investment records. But there is far more to successful long-term investing than brains and performance that has recently been good.

Over time, markets will do extraordinary, even bizarre, things. A single, big mistake could wipe out a long string of successes. We therefore need someone genetically programmed to recognize and avoid serious risks, *including those never before encountered*. Certain perils that lurk in investment strategies cannot be spotted by use of the models commonly employed today by financial institutions.

Temperament is also important. Independent thinking, emotional stability, and a keen understanding of both human and institutional behavior is vital to long-term investment success. I've seen a lot of very smart people who have lacked these virtues.

Finally, we have a special problem to consider: our ability to keep the person we hire. Being able to list Berkshire on a resume would materially enhance the marketability of an investment manager. We will need, therefore, to be sure we can retain our choice, even though he or she could leave and make much more money elsewhere.

There are surely people who fit what we need, but they may be hard to identify. In 1979, Jack Byrne and I felt we had found such a person in Lou Simpson. We then made an arrangement with him whereby he would be paid well for sustained overperformance. Under this deal, he has earned large amounts. Lou, however, could have left us long ago to manage far greater sums on more advantageous terms. If money alone had been the object, that's exactly what he would have done. But Lou never considered such a move. We need to find a younger person or two made of the same stuff.

* * * * * * * * * * * *

The good news: At 76, I feel terrific and, according to all measurable indicators, am in excellent health. It's amazing what Cherry Coke and hamburgers will do for a fellow.

Some Changes on Berkshire's Board

The composition of our board will change in two ways this spring. One change will involve the Chace family, which has been connected to Berkshire and its predecessor companies for more than a century. In 1929, the first Malcolm G. Chace played an important role in merging four New England textile operations into Berkshire Fine Spinning Associates. That company merged with Hathaway Manufacturing in 1955 to form Berkshire Hathaway, and Malcolm G. Chace, Jr. became its chairman.

Early in 1965, Malcolm arranged for Buffett Partnership Ltd. to buy a key block of Berkshire shares and welcomed us as the new controlling shareholder of the company. Malcolm continued as non-executive chairman until 1969. He was both a wonderful gentleman and helpful partner.

That description also fits his son, Malcolm "Kim" Chace, who succeeded his father on Berkshire's board in 1992. But last year Kim, now actively and successfully running a community bank that he founded in 1996, suggested that we find a younger person to replace him on our board. We have done so, and Kim will step down as a director at the annual meeting. I owe much to the Chaces and wish to thank Kim for his many years of service to Berkshire.

In selecting a new director, we were guided by our long-standing criteria, which are that board members be owner-oriented, business-savvy, interested and truly independent. I say "truly" because many directors who are now deemed independent by various authorities and observers are far from that, relying heavily as they do on directors' fees to maintain their standard of living. These payments, which come in many forms, often range between $150,000 and $250,000 annually, compensation that may approach or even exceed all other income of the "independent" director. And – surprise, surprise – director compensation has soared in recent years, pushed up by recommendations from corporate America's favorite consultant, Ratchet, Ratchet and Bingo. (The name may be phony, but the action it conveys is not.)

Charlie and I believe our four criteria are essential if directors are to do their job – which, by law, is to faithfully represent *owners*. Yet these criteria are usually ignored. Instead, consultants and CEOs seeking board candidates will often say, "We're looking for a woman," or "a Hispanic," or "someone from abroad," or what have you. It sometimes sounds as if the mission is to stock Noah's ark. Over the years I've been queried many times about potential directors and have yet to hear *anyone* ask, "Does he think like an intelligent owner?"

The questions I instead get would sound ridiculous to someone seeking candidates for, say, a football team, or an arbitration panel or a military command. In those cases, the selectors would look for people who had the specific talents and attitudes that were required for a specialized job. At Berkshire, we are in the specialized activity of running a business well, and therefore we seek *business* judgment.

That's exactly what we've found in Susan Decker, CFO of Yahoo!, who will join our board at the annual meeting. We are lucky to have her: She scores very high on our four criteria and additionally, at 44, is young – an attribute, as you may have noticed, that your Chairman has long lacked. We will seek more young directors in the future, but never by slighting the four qualities that we insist upon.

This and That

Berkshire will pay about $4.4 billion in federal income tax on its 2006 earnings. In its last fiscal year the U.S. Government spent $2.6 trillion, or about $7 billion per day. Thus, for more than half of one day, Berkshire picked up the tab for *all* federal expenditures, ranging from Social Security and Medicare payments to the cost of our armed services. Had there been only 600 taxpayers like Berkshire, no one else in America would have needed to pay *any* federal income or payroll taxes.

* * * * * * * * * * * *

Our federal return last year, we should add, ran to 9,386 pages. To handle this filing, state and foreign tax returns, a myriad of SEC requirements, and all of the other matters involved in running Berkshire, we have gone all the way up to 19 employees at World Headquarters.

This crew occupies 9,708 square feet of space, and Charlie – at World Headquarters West in Los Angeles – uses another 655 square feet. Our home-office payroll, including benefits and counting both locations, totaled $3,531,978 last year. We're careful when spending your money.

Corporate bigwigs often complain about government spending, criticizing bureaucrats who they say spend taxpayers' money differently from how they would if it were their own. But sometimes the financial behavior of executives will also vary based on whose wallet is getting depleted. Here's an illustrative tale from my days at Salomon. In the 1980s the company had a barber, Jimmy by name, who came in weekly to give free haircuts to the top brass. A manicurist was also on tap. Then, because of a cost-cutting drive, patrons were told to pay their own way. One top executive (not the CEO) who had previously visited Jimmy weekly went immediately to a once-every-three-weeks schedule.

* * * * * * * * * * * *

Every now and then Charlie and I catch on early to a tide-like trend, one brimming over with commercial promise. For example, though American Airlines (with its "miles") and American Express (with credit card points) are credited as being trailblazers in granting customers "rewards," Charlie and I were far ahead of them in spotting the appeal of this powerful idea. Excited by our insight, the two of us jumped into the reward business way back in 1970 by buying control of a trading stamp operation, Blue Chip Stamps. In that year, Blue Chip had sales of $126 million, and its stamps papered California.

In 1970, indeed, about 60 *billion* of our stamps were licked by savers, pasted into books, and taken to Blue Chip redemption stores. Our catalog of rewards was 116 pages thick and chock full of tantalizing items. When I was told that even certain brothels and mortuaries gave stamps to their patrons, I felt I had finally found a sure thing.

Well, not quite. From the day Charlie and I stepped into the Blue Chip picture, the business went straight downhill. By 1980, sales had fallen to $19.4 million. And, by 1990, sales were bumping along at $1.5 million. No quitter, I redoubled my managerial efforts.

Sales then fell another 98%. Last year, in Berkshire's $98 billion of revenues, all of $25,920 (*no* zeros omitted) came from Blue Chip. Ever hopeful, Charlie and I soldier on.

* * * * * * * * * * * *

I mentioned last year that in my service on 19 corporate boards (not counting Berkshire or other controlled companies), I have been the Typhoid Mary of compensation committees. At only one company was I assigned to comp committee duty, and then I was promptly outvoted on the most crucial decision that we faced. My ostracism has been peculiar, considering that I certainly haven't lacked experience in setting CEO pay. At Berkshire, after all, I am a one-man compensation committee who determines the salaries and incentives for the CEOs of around 40 significant operating businesses.

How much time does this aspect of my job take? Virtually none. How many CEOs have voluntarily left us for other jobs in our 42-year history? Precisely none.

Berkshire employs many different incentive arrangements, with their terms depending on such elements as the economic potential or capital intensity of a CEO's business. Whatever the compensation arrangement, though, I try to keep it both simple and fair.

When we use incentives – and these can be large – they are always tied to the operating results for which a given CEO has authority. We issue no lottery tickets that carry payoffs unrelated to business performance. If a CEO bats .300, he gets paid for being a .300 hitter, even if circumstances outside of his control cause Berkshire to perform poorly. And if he bats .150, he doesn't get a payoff just because the successes of others have enabled Berkshire to prosper mightily. An example: We now own $61 billion of equities at Berkshire, whose value can easily rise or fall by 10% in a given year. Why in the world should the pay of our operating executives be affected by such $6 billion swings, however important the gain or loss may be for shareholders?

You've read loads about CEOs who have received astronomical compensation for mediocre results. Much less well-advertised is the fact that America's CEOs also generally live the good life. Many, it should be emphasized, are exceptionally able, and almost all work far more than 40 hours a week. But they are usually treated like royalty in the process. (And we're certainly going to keep it that way at Berkshire. Though Charlie still favors sackcloth and ashes, I prefer to be spoiled rotten. Berkshire owns The Pampered Chef; our wonderful office group has made me The Pampered Chief.)

CEO perks at one company are quickly copied elsewhere. "All the other kids have one" may seem a thought too juvenile to use as a rationale in the boardroom. But consultants employ precisely this argument, phrased more elegantly of course, when they make recommendations to comp committees.

Irrational and excessive comp practices will not be materially changed by disclosure or by "independent" comp committee members. Indeed, I think it's likely that the reason I was rejected for service on so many comp committees was that I was regarded as *too* independent. Compensation reform will only occur if the largest institutional shareholders – it would only take a few – demand a *fresh* look at the whole system. The consultants' present drill of deftly selecting "peer" companies to compare with their clients will only perpetuate present excesses.

* * * * * * * * * * * *

Last year I arranged for the bulk of my Berkshire holdings to go to five charitable foundations, thus carrying out part of my lifelong plan to eventually use all of my shares for philanthropic purposes. Details of the commitments I made, as well as the rationale for them, are posted on our website, www.berkshirehathaway.com. Taxes, I should note, had nothing to do with my decision or its timing. My federal and state income taxes in 2006 were exactly what they would have been had I not made my first contributions last summer, and the same point will apply to my 2007 contributions.

In my will I've stipulated that the proceeds from all Berkshire shares I still own at death are to be used for philanthropic purposes within ten years after my estate is closed. Because my affairs are not complicated, it should take three years at most for this closing to occur. Adding this 13-year period to my expected lifespan of about 12 years (though, naturally, I'm aiming for more) means that proceeds from *all* of my Berkshire shares will likely be distributed for societal purposes over the next 25 years or so.

I've set this schedule because I want the money to be spent relatively promptly by people I *know* to be capable, vigorous and motivated. These managerial attributes sometimes wane as institutions – particularly those that are exempt from market forces – age. Today, there are terrific people in charge at the five foundations. So at my death, why should they not move with dispatch to judiciously spend the money that remains?

Those people favoring perpetual foundations argue that in the future there will most certainly be large and important societal problems that philanthropy will need to address. I agree. But there will then also be many super-rich individuals and families whose wealth will exceed that of today's Americans and to whom philanthropic organizations can make their case for funding. These funders can *then* judge firsthand which operations have both the vitality and the focus to best address the major societal problems that *then* exist. In this way, a market test of ideas and effectiveness can be applied. Some organizations will deserve major support while others will have outlived their usefulness. Even if the people above ground make their decisions imperfectly, they should be able to allocate funds more rationally than a decedent six feet under will have ordained decades earlier. Wills, of course, can always be rewritten, but it's very unlikely that my thinking will change in a material way.

A few shareholders have expressed concern that sales of Berkshire by the foundations receiving shares will depress the stock. These fears are unwarranted. The annual trading volume of many stocks exceeds 100% of the outstanding shares, but nevertheless these stocks usually sell at prices approximating their intrinsic value. Berkshire also tends to sell at an appropriate price, but with annual volume that is only 15% of shares outstanding. At most, sales by the foundations receiving my shares will add three percentage points to annual trading volume, which will still leave Berkshire with a turnover ratio that is the lowest around.

Overall, Berkshire's business performance will determine the price of our stock, and most of the time it will sell in a zone of reasonableness. It's important that the foundations receive appropriate prices as they periodically sell Berkshire shares, but it's also important that incoming shareholders don't overpay. (See economic principle 14 on page 77.) By both our policies and shareholder communications, Charlie and I will do our best to ensure that Berkshire sells at neither a large discount nor large premium to intrinsic value.

The existence of foundation ownership will in no way influence our board's decisions about dividends, repurchases, or the issuance of shares. We will follow exactly the same rule that has guided us in the past: What action will be likely to deliver the best result for shareholders over time?

* * * * * * * * * * * * *

In last year's report I allegorically described the Gotrocks family – a clan that owned all of America's businesses and that counterproductively attempted to increase its investment returns by paying ever-greater commissions and fees to "helpers." Sad to say, the "family" continued its self-destructive ways in 2006.

In part the family persists in this folly because it harbors unrealistic expectations about obtainable returns. Sometimes these delusions are self-serving. For example, private pension plans can temporarily overstate their earnings, and public pension plans can defer the need for increased taxes, by using investment assumptions that are likely to be out of reach. Actuaries and auditors go along with these tactics, and it can be decades before the chickens come home to roost (at which point the CEO or public official who misled the world is apt to be gone).

Meanwhile, Wall Street's Pied Pipers of Performance will have encouraged the futile hopes of the family. The hapless Gotrocks will be assured that they *all* can achieve above-average investment performance – but only by paying ever-higher fees. Call this promise the adult version of Lake Woebegon.

In 2006, promises and fees hit new highs. A flood of money went from institutional investors to the 2-and-20 crowd. For those innocent of this arrangement, let me explain: It's a lopsided system whereby 2% of your *principal* is paid each year to the manager even if he accomplishes nothing – or, for that matter, loses you a bundle – and, additionally, 20% of your profit is paid to him if he succeeds, even if his success is due simply to a rising tide. For example, a manager who achieves a gross return of 10% in a year will keep 3.6 percentage points – two points off the top plus 20% of the residual 8 points – leaving only 6.4 percentage points for his investors. On a $3 billion fund, this 6.4% net "performance" will deliver the manager a cool $108 million. He will receive this bonanza even though an index fund might have returned 15% to investors in the same period and charged them only a token fee.

The inexorable math of this grotesque arrangement is certain to make the Gotrocks family poorer over time than it would have been had it never heard of these "hyper-helpers." Even so, the 2-and-20 action spreads. Its effects bring to mind the old adage: When someone with experience proposes a deal to someone with money, too often the fellow with money ends up with the experience, and the fellow with experience ends up with the money.

* * * * * * * * * * *

Let me end this section by telling you about one of the good guys of Wall Street, my long-time friend Walter Schloss, who last year turned 90. From 1956 to 2002, Walter managed a remarkably successful investment partnership, from which he took not a dime unless his investors made money. My admiration for Walter, it should be noted, is not based on hindsight. A full fifty years ago, Walter was my sole recommendation to a St. Louis family who wanted an honest and able investment manager.

Walter did not go to business school, or for that matter, college. His office contained one file cabinet in 1956; the number mushroomed to four by 2002. Walter worked without a secretary, clerk or bookkeeper, his only associate being his son, Edwin, a graduate of the North Carolina School of the Arts. Walter and Edwin never came within a mile of inside information. Indeed, they used "outside" information only sparingly, generally selecting securities by certain simple statistical methods Walter learned while working for Ben Graham. When Walter and Edwin were asked in 1989 by *Outstanding Investors Digest*, "How would you summarize your approach?" Edwin replied, "We try to buy stocks cheap." So much for Modern Portfolio Theory, technical analysis, macroeconomic thoughts and complex algorithms.

Following a strategy that involved no real risk – defined as permanent loss of capital – Walter produced results over his 47 partnership years that dramatically surpassed those of the S&P 500. It's particularly noteworthy that he built this record by investing in about 1,000 securities, mostly of a lackluster type. A few big winners did not account for his success. It's safe to say that had millions of investment managers made trades by a) drawing stock names from a hat; b) purchasing these stocks in comparable amounts when Walter made a purchase; and then c) selling when Walter sold his pick, the *luckiest* of them would not have come close to equaling his record. There is simply *no* possibility that what Walter achieved over 47 years was due to chance.

I first publicly discussed Walter's remarkable record in 1984. At that time "efficient market theory" (EMT) was the centerpiece of investment instruction at most major business schools. This theory, as then most commonly taught, held that the price of any stock at any moment is not demonstrably mispriced, which means that no investor can be *expected* to overperform the stock market averages using only publicly-available information (though some will do so by luck). When I talked about Walter 23 years ago, his record forcefully contradicted this dogma.

And what did members of the academic community do when they were exposed to this new and important evidence? Unfortunately, they reacted in all-too-human fashion: Rather than opening their minds, they closed their eyes. To my knowledge *no* business school teaching EMT made any attempt to study Walter's performance and what it meant for the school's cherished theory.

Instead, the faculties of the schools went merrily on their way presenting EMT as having the certainty of scripture. Typically, a finance instructor who had the nerve to question EMT had about as much chance of major promotion as Galileo had of being named Pope.

Tens of thousands of students were therefore sent out into life believing that on every day the price of every stock was "right" (or, more accurately, not demonstrably wrong) and that attempts to evaluate businesses – that is, stocks – were useless. Walter meanwhile went on overperforming, his job made easier by the misguided instructions that had been given to those young minds. After all, if you are in the shipping business, it's helpful to have all of your potential competitors be taught that the earth is flat.

Maybe it was a good thing for his investors that Walter didn't go to college.

The Annual Meeting

Our meeting this year will be held on Saturday, May 5th. As always, the doors will open at the Qwest Center at 7 a.m., and a new Berkshire movie will be shown at 8:30. At 9:30 we will go directly to the question-and-answer period, which (with a break for lunch at the Qwest's stands) will last until 3:00. Then, after a short recess, Charlie and I will convene the annual meeting at 3:15. If you decide to leave during the day's question periods, please do so while *Charlie* is talking.

The best reason to exit, of course is to *shop*. We will help you do that by filling the 194,300 square foot hall that adjoins the meeting area with the products of Berkshire subsidiaries. Last year, the 24,000 people who came to the meeting did their part, and almost every location racked up record sales. But records are made to be broken, and I know you can do better.

This year we will again showcase a Clayton home (featuring Acme brick, Shaw carpet, Johns Manville insulation, MiTek fasteners, Carefree awnings and NFM furniture). You will find that the home, priced at $139,900, delivers excellent value. Last year, a helper at the Qwest bought one of two homes on display well before we opened the doors to shareholders. Flanking the Clayton home on the exhibition floor this year will be an RV and pontoon boat from Forest River.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 45 of the 50 jurisdictions in which we operate. (One supplemental point: The discount is not additive if you qualify for another, such as that given certain groups.) Bring the details of your existing insurance and check out whether we can save you money. For at least 50% of you, I believe we can. And while you're at it, sign up for the new GEICO credit card. It's the one I now use (sparingly, of course).

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets available for your inspection. Stop by the NetJets booth at the Qwest to learn about viewing these planes. Come to Omaha by bus; leave in your new plane. And take all the hair gel that you wish on board with you.

In the Bookworm's corner of our bazaar, there will be about 25 books and DVDs – all discounted – led again by *Poor Charlie's Almanack*. (One hapless soul last year asked Charlie what he should do if he didn't enjoy the book. Back came a Mungerism: "No problem – just give it to someone more intelligent.") We've added a few titles this year. Among them are *Seeking Wisdom: From Darwin to Munger* by Peter Bevelin, a long-time Swedish shareholder of Berkshire, and Fred Schwed's classic, *Where are the Customers' Yachts?* This book was first published in 1940 and is now in its 4th edition. The funniest book ever written about investing, it lightly delivers many truly important messages on the subject.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. Carol Pedersen, who handles these matters, does a terrific job for us each year, and I thank her for it. Hotel rooms can be hard to find, but work with Carol and you will get one.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" discount pricing. We initiated this special event at NFM ten years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $30 million in 2006. I get goose bumps just thinking about this volume.

To obtain the Berkshire discount, you must make your purchases between Thursday, May 3rd and Monday, May 7th inclusive, and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but which, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. Monday through Saturday, and 10 a.m.

to 6 p.m. on Sunday. On Saturday this year, from 5:30 p.m. to 8 p.m., NFM is having a special shareholder picnic featuring chicken and beef tacos (and hamburgers for traditionalists like me).

At a remodeled and expanded Borsheim's, we will again have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, May 4th. The second, the main gala, will be held on Sunday, May 6th, from 9 a.m. to 4 p.m. On Saturday, we will be open until 6 p.m.

We will have huge crowds at Borsheim's throughout the weekend. For your convenience, therefore, shareholder prices will be available from Monday, April 30th through Saturday, May 12th. During that period, please identify yourself as a shareholder by presenting your meeting credentials or a brokerage statement that shows you are a Berkshire holder.

On Sunday, in a tent outside of Borsheim's, a blindfolded Patrick Wolff, twice U.S. chess champion, will take on all comers – who will have their eyes wide open – in groups of six. Last year I carried on a conversation with Patrick while he played in this manner. Nearby, Norman Beck, a remarkable magician from Dallas, will bewilder onlookers. Additionally, we will have Bob Hamman and Sharon Osberg, two of the world's top bridge experts, available to play bridge with our shareholders on Sunday afternoon.

To add to the Sunday fun at Borsheim's, Ariel Hsing will play table tennis (ping-pong to the uninitiated) from 1 p.m. to 4 p.m. against anyone brave enough to take her on. Ariel, though only 11, is ranked number one among girls under 16 in the U.S. (and number 1 among both boys and girls under 12). The week I turned 75 I played Ariel, then 9 and barely tall enough to see across the table, thinking I would take it easy on her so as not to crush her young spirit. Instead she crushed me. I've since devised a plan that will give me a chance against her. At 1 p.m. on Sunday, I will initiate play with a *2-point* game against Ariel. If I somehow win the first point, I will then feign injury and claim victory. After this strenuous encounter wears Ariel down, our shareholders can then try their luck against her.

Gorat's will again be open exclusively for Berkshire shareholders on Sunday, May 6th, and will be serving from 4 p.m. until 10 p.m. Please remember that to come to Gorat's on that day, you must have a reservation. To make one, call 402-551-3733 on April 1st (*but not before*).

In the 2006-2007 school year, 35 university classes, including one from IBMEC in Brazil, will come to Omaha for sessions with me. I take almost all – in aggregate, more than 2,000 students – to lunch at Gorat's. And they love it. To learn why, come join us on Sunday.

We will again have a reception at 4 p.m. on Saturday afternoon for shareholders who have come from outside of North America. Every year our meeting draws many people from around the globe, and Charlie and I want to be sure we personally greet those who have come so far. Last year we enjoyed meeting more than 400 of you from many dozens of countries. Any shareholder who comes from other than the U.S. or Canada will be given a special credential and instructions for attending this function.

* * * * * * * * * * * *

Charlie and I are extraordinarily lucky. We were born in America; had terrific parents who saw that we got good educations; have enjoyed wonderful families and great health; and came equipped with a "business" gene that allows us to prosper in a manner hugely disproportionate to other people who contribute as much or more to our society's well-being. Moreover, we have long had jobs that we love, in which we are helped every day in countless ways by talented and cheerful associates. No wonder we tap-dance to work. But nothing is more fun for us than getting together with our shareholder-partners at Berkshire's annual meeting. So join us on May 5th at the Qwest for our annual Woodstock for Capitalists. We'll see you there.

February 28, 2007

Warren E. Buffett
Chairman of the Board

Note: The following table appears in the printed Annual Report on the facing page of the Chairman's Letter and is referred to in that letter.

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0
1969	16.2	(8.4)	24.6
1970	12.0	3.9	8.1
1971	16.4	14.6	1.8
1972	21.7	18.9	2.8
1973	4.7	(14.8)	19.5
1974	5.5	(26.4)	31.9
1975	21.9	37.2	(15.3)
1976	59.3	23.6	35.7
1977	31.9	(7.4)	39.3
1978	24.0	6.4	17.6
1979	35.7	18.2	17.5
1980	19.3	32.3	(13.0)
1981	31.4	(5.0)	36.4
1982	40.0	21.4	18.6
1983	32.3	22.4	9.9
1984	13.6	6.1	7.5
1985	48.2	31.6	16.6
1986	26.1	18.6	7.5
1987	19.5	5.1	14.4
1988	20.1	16.6	3.5
1989	44.4	31.7	12.7
1990	7.4	(3.1)	10.5
1991	39.6	30.5	9.1
1992	20.3	7.6	12.7
1993	14.3	10.1	4.2
1994	13.9	1.3	12.6
1995	43.1	37.6	5.5
1996	31.8	23.0	8.8
1997	34.1	33.4	.7
1998	48.3	28.6	19.7
1999	.5	21.0	(20.5)
2000	6.5	(9.1)	15.6
2001	(6.2)	(11.9)	5.7
2002	10.0	(22.1)	32.1
2003	21.0	28.7	(7.7)
2004	10.5	10.9	(.4)
2005	6.4	4.9	1.5
2006	18.4	15.8	2.6
2007	11.0	5.5	5.5
Compounded Annual Gain – 1965-2007	21.1%	10.3%	10.8
Overall Gain – 1964-2007	400,863%	6,840%	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P 500 in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our gain in net worth during 2007 was $12.3 billion, which increased the per-share book value of both our Class A and Class B stock by 11%. Over the last 43 years (that is, since present management took over) book value has grown from $19 to $78,008, a rate of 21.1% compounded annually.*

Overall, our 76 operating businesses did well last year. The few that had problems were primarily those linked to housing, among them our brick, carpet and real estate brokerage operations. Their setbacks are minor and temporary. Our competitive position in these businesses remains strong, and we have first-class CEOs who run them right, in good times or bad.

Some major financial institutions have, however, experienced staggering problems because they engaged in the "weakened lending practices" I described in last year's letter. John Stumpf, CEO of Wells Fargo, aptly dissected the recent behavior of many lenders: "It is interesting that the industry has invented new ways to lose money when the old ways seemed to work just fine."

You may recall a 2003 Silicon Valley bumper sticker that implored, "Please, God, Just One More Bubble." Unfortunately, this wish was promptly granted, as just about all Americans came to believe that house prices would forever rise. That conviction made a borrower's income and cash equity seem unimportant to lenders, who shoveled out money, confident that HPA – house price appreciation – would cure all problems. Today, our country is experiencing widespread pain because of that erroneous belief. As house prices fall, a huge amount of financial folly is being exposed. You only learn who has been swimming naked when the tide goes out – and what we are witnessing at some of our largest financial institutions is an ugly sight.

Turning to happier thoughts, we can report that Berkshire's newest acquisitions of size, TTI and Iscar, led by their CEOs, Paul Andrews and Jacob Harpaz respectively, performed magnificently in 2007. Iscar is as impressive a manufacturing operation as I've seen, a view I reported last year and that was confirmed by a visit I made in the fall to its extraordinary plant in Korea.

Finally, our insurance business – the cornerstone of Berkshire – had an excellent year. Part of the reason is that we have the best collection of insurance managers in the business – more about them later. But we also were very lucky in 2007, the second year in a row free of major insured catastrophes.

That party is over. It's a *certainty* that insurance-industry profit margins, including ours, will fall significantly in 2008. Prices are down, and exposures inexorably rise. Even if the U.S. has its third consecutive catastrophe-light year, industry profit margins will probably shrink by four percentage points or so. If the winds roar or the earth trembles, results could be *far* worse. So be prepared for lower insurance earnings during the next few years.

Yardsticks

Berkshire has two major areas of value. The first is our investments: stocks, bonds and cash equivalents. At yearend these totaled $141 billion (not counting those in our finance or utility operations, which we assign to our second bucket of value).

*****All per-share figures used in this report apply to Berkshire's A shares. Figures for the B shares are 1/30th of those shown for the A.

Insurance float – money we temporarily hold in our insurance operations that does not belong to us – funds $59 billion of our investments. This float is "free" as long as insurance underwriting breaks even, meaning that the premiums we receive equal the losses and expenses we incur. Of course, insurance underwriting is volatile, swinging erratically between profits and losses. Over our entire history, however, we've been profitable, and I expect we will average breakeven results or better in the future. If we do that, our investments can be viewed as an unencumbered source of value for Berkshire shareholders.

Berkshire's second component of value is earnings that come from sources other than investments and insurance. These earnings are delivered by our 66 non-insurance companies, itemized on page 76. In our early years, we focused on the investment side. During the past two decades, however, we have put ever more emphasis on the development of earnings from non-insurance businesses.

The following tables illustrate this shift. In the first we tabulate per-share investments at 14-year intervals. We exclude those applicable to minority interests.

Year	*Per-Share Investments*	*Years*	*Compounded Annual Gain in Per-Share Investments*
1965	$ 4		
1979	577	1965-1979	42.8%
1993	13,961	1979-1993	25.6%
2007	90,343	1993-2007	14.3%

For the entire 42 years, our compounded annual gain in per-share investments was 27.1%. But the trend has been downward as we increasingly used our available funds to buy operating businesses.

Here's the record on how earnings of our non-insurance businesses have grown, again on a per-share basis and after applicable minority interests.

Year	*Per Share Pre-Tax Earnings*	*Years*	*Compounded Annual Gain in Per-Share Pre-Tax Earnings*
1965	$ 4		
1979	18	1965-1979	11.1%
1993	212	1979-1993	19.1%
2007	4,093	1993-2007	23.5%

For the entire period, the compounded annual gain was 17.8%, with gains accelerating as our focus shifted.

Though these tables may help you gain historical perspective and be useful in valuation, they are completely misleading in predicting future possibilities. *Berkshire's past record can't be duplicated or even approached. Our base of assets and earnings is now far too large for us to make outsized gains in the future.*

Charlie Munger, my partner at Berkshire, and I will continue to measure our progress by the two yardsticks I have just described and will regularly update you on the results. Though we can't come close to duplicating the past, we will do our best to make sure the future is not disappointing.

* * * * * * * * * * * *

In our efforts, we will be aided enormously by the managers who have joined Berkshire. This is an unusual group in several ways. First, most of them have no financial need to work. Many sold us their businesses for large sums and run them because they love doing so, not because they need the money. Naturally they wish to be paid fairly, but money alone is not the reason they work hard and productively.

A second, somewhat related, point about these managers is that they have exactly the job they want for the rest of their working years. At almost any other company, key managers below the top aspire to keep climbing the pyramid. For them, the subsidiary or division they manage today is a way station – or so they hope. Indeed, if they are in their present positions five years from now, they may well feel like failures.

Conversely, our CEOs' scorecards for success are not whether they obtain my job but instead are the long-term performances of their businesses. Their decisions flow from a here-today, here-forever mindset. I think our rare and hard-to-replicate managerial structure gives Berkshire a real advantage.

Acquisitions

Though our managers may be the best, we will need large and sensible acquisitions to get the growth in operating earnings we wish. Here, we made little progress in 2007 until very late in the year. Then, on Christmas day, Charlie and I finally earned our paychecks by contracting for the largest cash purchase in Berkshire's history.

The seeds of this transaction were planted in 1954. That fall, only three months into a new job, I was sent by my employers, Ben Graham and Jerry Newman, to a shareholders' meeting of Rockwood Chocolate in Brooklyn. A young fellow had recently taken control of this company, a manufacturer of assorted cocoa-based items. He had then initiated a one-of-a-kind tender, offering 80 pounds of cocoa beans for each share of Rockwood stock. I described this transaction in a section of the 1988 annual report that explained arbitrage. I also told you that Jay Pritzker – the young fellow mentioned above – was the business genius behind this tax-efficient idea, the possibilities for which had escaped all the other experts who had thought about buying Rockwood, including my bosses, Ben and Jerry.

At the meeting, Jay was friendly and gave me an education on the 1954 tax code. I came away very impressed. Thereafter, I avidly followed Jay's business dealings, which were many and brilliant. His valued partner was his brother, Bob, who for nearly 50 years ran Marmon Group, the home for most of the Pritzker businesses.

Jay died in 1999, and Bob retired early in 2002. Around then, the Pritzker family decided to gradually sell or reorganize certain of its holdings, including Marmon, a company operating 125 businesses, managed through nine sectors. Marmon's largest operation is Union Tank Car, which together with a Canadian counterpart owns 94,000 rail cars that are leased to various shippers. The original cost of this fleet is $5.1 billion. All told, Marmon has $7 billion in sales and about 20,000 employees.

We will soon purchase 60% of Marmon and will acquire virtually all of the balance within six years. Our initial outlay will be $4.5 billion, and the price of our later purchases will be based on a formula tied to earnings. Prior to our entry into the picture, the Pritzker family received substantial consideration from Marmon's distribution of cash, investments and certain businesses.

This deal was done in the way Jay would have liked. We arrived at a price using only Marmon's financial statements, employing no advisors and engaging in no nit-picking. I knew that the business would be exactly as the Pritzkers represented, and they knew that we would close on the dot, however chaotic financial markets might be. During the past year, many large deals have been renegotiated or killed entirely. With the Pritzkers, as with Berkshire, a deal is a deal.

Marmon's CEO, Frank Ptak, works closely with a long-time associate, John Nichols. John was formerly the highly successful CEO of Illinois Tool Works (ITW), where he teamed with Frank to run a mix of industrial businesses. Take a look at their ITW record; you'll be impressed.

Byron Trott of Goldman Sachs – whose praises I sang in the 2003 report – facilitated the Marmon transaction. Byron is the rare investment banker who puts himself in his client's shoes. Charlie and I trust him completely.

You'll like the code name that Goldman Sachs assigned the deal. Marmon entered the auto business in 1902 and exited it in 1933. Along the way it manufactured the Wasp, a car that won the first Indianapolis 500 race, held in 1911. So this deal was labeled "Indy 500."

* * * * * * * * * * * *

In May 2006, I spoke at a lunch at Ben Bridge, our Seattle-based jewelry chain. The audience was a number of its vendors, among them Dennis Ulrich, owner of a company that manufactured gold jewelry.

In January 2007, Dennis called me, suggesting that with Berkshire's support he could build a large jewelry supplier. We soon made a deal for his business, simultaneously purchasing a supplier of about equal size. The new company, Richline Group, has since made two smaller acquisitions. Even with those, Richline is far below the earnings threshold we normally require for purchases. I'm willing to bet, however, that Dennis – with the help of his partner, Dave Meleski – will build a large operation, earning good returns on capital employed.

Businesses – The Great, the Good and the Gruesome

Let's take a look at what kind of businesses turn us on. And while we're at it, let's also discuss what we wish to avoid.

Charlie and I look for companies that have a) a business we understand; b) favorable long-term economics; c) able and trustworthy management; and d) a sensible price tag. We like to buy the whole business or, if management is our partner, at least 80%. When control-type purchases of quality aren't available, though, we are also happy to simply buy small portions of great businesses by way of stock-market purchases. It's better to have a part interest in the Hope Diamond than to own all of a rhinestone.

A truly great business must have an enduring "moat" that protects excellent returns on invested capital. The dynamics of capitalism guarantee that competitors will repeatedly assault any business "castle" that is earning high returns. Therefore a formidable barrier such as a company's being the low-cost producer (GEICO, Costco) or possessing a powerful world-wide brand (Coca-Cola, Gillette, American Express) is essential for sustained success. Business history is filled with "Roman Candles," companies whose moats proved illusory and were soon crossed.

Our criterion of "enduring" causes us to rule out companies in industries prone to rapid and continuous change. Though capitalism's "creative destruction" is highly beneficial for society, it precludes investment certainty. A moat that must be continuously rebuilt will eventually be no moat at all.

Additionally, this criterion eliminates the business whose success *depends* on having a great manager. Of course, a terrific CEO is a huge asset for any enterprise, and at Berkshire we have an abundance of these managers. Their abilities have created billions of dollars of value that would never have materialized if typical CEOs had been running their businesses.

But if a business *requires* a superstar to produce great results, the business itself cannot be deemed great. A medical partnership led by your area's premier brain surgeon may enjoy outsized and growing earnings, but that tells little about its future. The partnership's moat will go when the surgeon goes. You can count, though, on the moat of the Mayo Clinic to endure, even though you can't name its CEO.

Long-term competitive advantage in a stable industry is what we seek in a business. If that comes with rapid organic growth, great. But even without organic growth, such a business is rewarding. We will simply take the lush earnings of the business and use them to buy similar businesses elsewhere. There's no rule that you have to invest money where you've earned it. Indeed, it's often a mistake to do so: Truly great businesses, earning huge returns on tangible assets, *can't* for any extended period reinvest a large portion of their earnings internally at high rates of return.

Let's look at the prototype of a dream business, our own See's Candy. The boxed-chocolates industry in which it operates is unexciting: Per-capita consumption in the U.S. is extremely low and doesn't grow. Many once-important brands have disappeared, and only three companies have earned more than token profits over the last forty years. Indeed, I believe that See's, though it obtains the bulk of its revenues from only a few states, accounts for nearly half of the entire industry's earnings.

At See's, annual sales were 16 million pounds of candy when Blue Chip Stamps purchased the company in 1972. (Charlie and I controlled Blue Chip at the time and later merged it into Berkshire.) Last year See's sold 31 million pounds, a growth rate of only 2% annually. Yet its durable competitive advantage, built by the See's family over a 50-year period, and strengthened subsequently by Chuck Huggins and Brad Kinstler, has produced extraordinary results for Berkshire.

We bought See's for $25 million when its sales were $30 million and pre-tax earnings were less than $5 million. The capital then required to conduct the business was $8 million. (Modest seasonal debt was also needed for a few months each year.) Consequently, the company was earning 60% pre-tax on invested capital. Two factors helped to minimize the funds required for operations. First, the product was sold for cash, and that eliminated accounts receivable. Second, the production and distribution cycle was short, which minimized inventories.

Last year See's sales were $383 million, and pre-tax profits were $82 million. The capital now required to run the business is $40 million. This means we have had to reinvest only $32 million since 1972 to handle the modest physical growth – and somewhat immodest financial growth – of the business. In the meantime pre-tax earnings have totaled $1.35 billion. *All of that*, except for the $32 million, has been sent to Berkshire (or, in the early years, to Blue Chip). After paying corporate taxes on the profits, we have used the rest to buy other attractive businesses. Just as Adam and Eve kick-started an activity that led to six billion humans, See's has given birth to multiple new streams of cash for us. (The biblical command to "be fruitful and multiply" is one we take seriously at Berkshire.)

There aren't many See's in Corporate America. Typically, companies that increase their earnings from $5 million to $82 million require, say, $400 million or so of capital investment to finance their growth. That's because growing businesses have both working capital needs that increase in proportion to sales growth and significant requirements for fixed asset investments.

A company that needs large increases in capital to engender its growth may well prove to be a satisfactory investment. There is, to follow through on our example, nothing shabby about earning $82 million pre-tax on $400 million of net tangible assets. But that equation for the owner is vastly different from the See's situation. It's far better to have an ever-increasing stream of earnings with virtually no major capital requirements. Ask Microsoft or Google.

One example of good, but far from sensational, business economics is our own FlightSafety. This company delivers benefits to its customers that are the equal of those delivered by any business that I know of. It also possesses a durable competitive advantage: Going to any other flight-training provider than the best is like taking the low bid on a surgical procedure.

Nevertheless, this business requires a significant reinvestment of earnings if it is to grow. When we purchased FlightSafety in 1996, its pre-tax operating earnings were $111 million, and its net investment in fixed assets was $570 million. Since our purchase, depreciation charges have totaled $923 million. But capital expenditures have totaled $1.635 billion, most of that for simulators to match the new airplane models that are constantly being introduced. (A simulator can cost us more than $12 million, and we have 273 of them.) Our fixed assets, after depreciation, now amount to $1.079 billion. Pre-tax operating earnings in 2007 were $270 million, a gain of $159 million since 1996. That gain gave us a good, but far from See's-like, return on our incremental investment of $509 million.

Consequently, if measured only by economic returns, FlightSafety is an excellent but not extraordinary business. Its put-up-more-to-earn-more experience is that faced by most corporations. For example, our large investment in regulated utilities falls squarely in this category. We will earn considerably more money in this business ten years from now, but we will invest many billions to make it.

Now let's move to the gruesome. The worst sort of business is one that grows rapidly, requires significant capital to engender the growth, and then earns little or no money. Think airlines. Here a *durable* competitive advantage has proven elusive ever since the days of the Wright Brothers. Indeed, if a farsighted capitalist had been present at Kitty Hawk, he would have done his successors a huge favor by shooting Orville down.

The airline industry's demand for capital ever since that first flight has been insatiable. Investors have poured money into a bottomless pit, attracted by growth when they should have been repelled by it. And I, to my shame, participated in this foolishness when I had Berkshire buy U.S. Air preferred stock in 1989. As the ink was drying on our check, the company went into a tailspin, and before long our preferred dividend was no longer being paid. But we then got very lucky. In one of the recurrent, but always misguided, bursts of optimism for airlines, we were actually able to sell our shares in 1998 for a hefty gain. In the decade following our sale, the company went bankrupt. Twice.

To sum up, think of three types of "savings accounts." The great one pays an extraordinarily high interest rate that will rise as the years pass. The good one pays an attractive rate of interest that will be earned also on deposits that are added. Finally, the gruesome account both pays an inadequate interest rate and requires you to keep adding money at those disappointing returns.

* * * * * * * * * * * *

And now it's confession time. It should be noted that no consultant, board of directors or investment banker pushed me into the mistakes I will describe. In tennis parlance, they were all unforced errors.

To begin with, I almost blew the See's purchase. The seller was asking $30 million, and I was adamant about not going above $25 million. Fortunately, he caved. Otherwise I would have balked, and that $1.35 billion would have gone to somebody else.

About the time of the See's purchase, Tom Murphy, then running Capital Cities Broadcasting, called and offered me the Dallas-Fort Worth NBC station for $35 million. The station came with the Fort Worth paper that Capital Cities was buying, and under the "cross-ownership" rules Murph had to divest it. I knew that TV stations were See's-like businesses that required virtually no capital investment and had excellent prospects for growth. They were simple to run and showered cash on their owners.

Moreover, Murph, then as now, was a close friend, a man I admired as an extraordinary manager and outstanding human being. He knew the television business forward and backward and would not have called me unless he felt a purchase was certain to work. In effect Murph whispered "buy" into my ear. But I didn't listen.

In 2006, the station earned $73 million pre-tax, bringing its total earnings since I turned down the deal to at least $1 billion – almost all available to its owner for other purposes. Moreover, the property now has a capital value of about $800 million. Why did I say "no"? The only explanation is that my brain had gone on vacation and forgot to notify me. (My behavior resembled that of a politician Molly Ivins once described: "If his I.Q. was any lower, you would have to water him twice a day.")

Finally, I made an even worse mistake when I said "yes" to Dexter, a shoe business I bought in 1993 for $433 million in Berkshire stock (25,203 shares of A). What I had assessed as durable competitive advantage vanished within a few years. But that's just the beginning: By using Berkshire stock, I compounded this error hugely. That move made the cost to Berkshire shareholders not $400 million, but rather $3.5 billion. In essence, I gave away 1.6% of a wonderful business – one now valued at $220 billion – to buy a worthless business.

To date, Dexter is the worst deal that I've made. But I'll make more mistakes in the future – you can bet on that. A line from Bobby Bare's country song explains what too often happens with acquisitions: "I've never gone to bed with an ugly woman, but I've sure woke up with a few."

* * * * * * * * * * * *

Now, let's examine the four major operating sectors of Berkshire. Each sector has vastly different balance sheet and income account characteristics. Therefore, lumping them together impedes analysis. So we'll present them as four separate businesses, which is how Charlie and I view them.

Insurance

The best anecdote I've heard during the current presidential campaign came from Mitt Romney, who asked his wife, Ann, "When we were young, did you ever in your wildest dreams think I might be president?" To which she replied, "Honey, you weren't *in* my wildest dreams."

When we first entered the property/casualty insurance business in 1967, my wildest dreams did not envision our current operation. Here's how we did in the first five years after purchasing National Indemnity:

Year	*Underwriting Profit (Loss)*	*Float*
	(in millions)	
1967	$ 0.4	$18.5
1968	0.6	21.3
1969	0.1	25.4
1970	(0.4)	39.4
1971	1.4	65.6

To put it charitably, we were a slow starter. But things changed. Here's the record of the last five years:

Year	*Underwriting Profit (Loss)*	*Float*
	(in millions)	
2003	$1,718	$44,220
2004	1,551	46,094
2005	53	49,287
2006	3,838	50,887
2007	3,374	58,698

This metamorphosis has been accomplished by some extraordinary managers. Let's look at what each has achieved.

- GEICO possesses the widest moat of any of our insurers, one carefully protected and expanded by Tony Nicely, its CEO. Last year – again – GEICO had the best growth record among major auto insurers, increasing its market share to 7.2%. When Berkshire acquired control in 1995, that share was 2.5%. Not coincidentally, annual ad expenditures by GEICO have increased from $31 million to $751 million during the same period.

  Tony, now 64, joined GEICO at 18. Every day since, he has been passionate about the company – proud of how it could both save money for its customers and provide growth opportunities for its associates. Even now, with sales at $12 billion, Tony feels GEICO is just getting started. So do I.

  Here's some evidence. In the last three years, GEICO has increased its share of the motorcycle market from 2.1% to 6%. We've also recently begun writing policies on ATVs and RVs. And in November we wrote our first *commercial* auto policy. GEICO and National Indemnity are working together in the commercial field, and early results are very encouraging.

  Even in aggregate, these lines will remain a small fraction of our personal auto volume. Nevertheless, they should deliver a growing stream of underwriting profits and float.

- General Re, our international reinsurer, is by far our largest source of "home-grown" float – $23 billion at yearend. This operation is now a huge asset for Berkshire. Our ownership, however, had a shaky start.

  For decades, General Re was the Tiffany of reinsurers, admired by all for its underwriting skills and discipline. This reputation, unfortunately, outlived its factual underpinnings, a flaw that I completely missed when I made the decision in 1998 to merge with General Re. The General Re of 1998 was not operated as the General Re of 1968 or 1978.

  Now, thanks to Joe Brandon, General Re's CEO, and his partner, Tad Montross, the luster of the company has been restored. Joe and Tad have been running the business for six years and have been doing first-class business in a first-class way, to use the words of J. P. Morgan. They have restored discipline to underwriting, reserving and the selection of clients.

  Their job was made more difficult by costly and time-consuming legacy problems, both in the U.S. and abroad. Despite that diversion, Joe and Tad have delivered excellent underwriting results while skillfully repositioning the company for the future.

- Since joining Berkshire in 1986, Ajit Jain has built a truly great specialty reinsurance operation from scratch. For one-of-a-kind mammoth transactions, the world now turns to him.

  Last year I told you in detail about the Equitas transfer of huge, but capped, liabilities to Berkshire for a single premium of $7.1 billion. At this very early date, our experience has been good. But this doesn't tell us much because it's just one straw in a fifty-year-or-more wind. What we know for sure, however, is that the London team who joined us, headed by Scott Moser, is first-rate and has become a valuable asset for our insurance business.

- Finally, we have our smaller operations, which serve specialized segments of the insurance market. In aggregate, these companies have performed extraordinarily well, earning above-average underwriting profits and delivering valuable float for investment.

  Last year BoatU.S., headed by Bill Oakerson, was added to the group. This company manages an association of about 650,000 boat owners, providing them services similar to those offered by AAA auto clubs to drivers. Among the association's offerings is boat insurance. Learn more about this operation by visiting its display at the annual meeting.

Below we show the record of our four categories of property/casualty insurance.

	Underwriting Profit		*Yearend Float*	
		(in millions)		
Insurance Operations	*2007*	*2006*	*2007*	*2006*
General Re	$ 555	$ 526	$23,009	$22,827
BH Reinsurance	1,427	1,658	23,692	16,860
GEICO	1,113	1,314	7,768	7,171
Other Primary	279	340*	4,229	4,029*
	$3,374	$3,838	$58,698	$50,887

* Includes Applied Underwriters from May 19, 2006.

Regulated Utility Business

Berkshire has an 87.4% (diluted) interest in MidAmerican Energy Holdings, which owns a wide variety of utility operations. The largest of these are (1) Yorkshire Electricity and Northern Electric, whose 3.8 million electric customers make it the third largest distributor of electricity in the U.K.; (2) MidAmerican Energy, which serves 720,000 electric customers, primarily in Iowa; (3) Pacific Power and Rocky Mountain Power, serving about 1.7 million electric customers in six western states; and (4) Kern River and Northern Natural pipelines, which carry about 8% of the natural gas consumed in the U.S.

Our partners in ownership of MidAmerican are Walter Scott, and its two terrific managers, Dave Sokol and Greg Abel. It's unimportant how many votes each party has; we make major moves only when we are unanimous in thinking them wise. Eight years of working with Dave, Greg and Walter have underscored my original belief: Berkshire couldn't have better partners.

Somewhat incongruously, MidAmerican also owns the second largest real estate brokerage firm in the U.S., HomeServices of America. This company operates through 20 locally-branded firms with 18,800 agents. Last year was a slow year for residential sales, and 2008 will probably be slower. We will continue, however, to acquire quality brokerage operations when they are available at sensible prices.

Here are some key figures on MidAmerican's operation:

	Earnings (in millions)	
	2007	*2006*
U.K. utilities	$ 337	$ 338
Iowa utility	412	348
Western utilities (acquired March 21, 2006)	692	356
Pipelines	473	376
HomeServices	42	74
Other (net)	130	245
Earnings before corporate interest and taxes	2,086	1,737
Interest, other than to Berkshire	(312)	(261)
Interest on Berkshire junior debt	(108)	(134)
Income tax	(477)	(426)
Net earnings	$ 1,189	$ 916
Earnings applicable to Berkshire*	$ 1,114	$ 885
Debt owed to others	19,002	16,946
Debt owed to Berkshire	821	1,055

*Includes interest earned by Berkshire (net of related income taxes) of $70 in 2007 and $87 in 2006.

We agreed to purchase 35,464,337 shares of MidAmerican at $35.05 per share in 1999, a year in which its per-share earnings were $2.59. Why the odd figure of $35.05? I originally decided the business was worth $35.00 per share to Berkshire. Now, I'm a "one-price" guy (remember See's?) and for several days the investment bankers representing MidAmerican had no luck in getting me to increase Berkshire's offer. But, finally, they caught me in a moment of weakness, and I caved, telling them I would go to $35.05. With that, I explained, they could tell their client they had wrung the last nickel out of me. At the time, it hurt.

Later on, in 2002, Berkshire purchased 6,700,000 shares at $60 to help finance the acquisition of one of our pipelines. Lastly, in 2006, when MidAmerican bought PacifiCorp, we purchased 23,268,793 shares at $145 per share.

In 2007, MidAmerican earned $15.78 per share. However, 77¢ of that was non-recurring – a reduction in deferred tax at our British utility, resulting from a lowering of the U.K. corporate tax rate. So call normalized earnings $15.01 per share. And yes, I'm glad I wilted and offered the extra nickel.

Manufacturing, Service and Retailing Operations

Our activities in this part of Berkshire cover the waterfront. Let's look, though, at a summary balance sheet and earnings statement for the entire group.

Balance Sheet 12/31/07 (in millions)

Assets		*Liabilities and Equity*	
Cash and equivalents	$ 2,080	Notes payable	$ 1,278
Accounts and notes receivable	4,488	Other current liabilities	7,652
Inventory	5,793	Total current liabilities	8,930
Other current assets	470		
Total current assets	12,831		
Goodwill and other intangibles	14,201	Deferred taxes	828
Fixed assets	9,605	Term debt and other liabilities	3,079
Other assets	1,685	Equity	25,485
	$38,322		$38,322

Earnings Statement (in millions)

	2007	*2006*	*2005*
Revenues	$59,100	$52,660	$46,896
Operating expenses (including depreciation of $955 in 2007, $823 in 2006 and $699 in 2005)	55,026	49,002	44,190
Interest expense	127	132	83
Pre-tax earnings	3,947*	3,526*	2,623*
Income taxes and minority interests	1,594	1,395	977
Net income	$ 2,353	$ 2,131	$ 1,646

*Does not include purchase-accounting adjustments.

This motley group, which sells products ranging from lollipops to motor homes, earned a pleasing 23% on average tangible net worth last year. It's noteworthy also that these operations used only minor financial leverage in achieving that return. Clearly we own some terrific businesses. We purchased many of them, however, at large premiums to net worth – a point reflected in the goodwill item shown on the balance sheet – and that fact reduces the earnings on our average *carrying* value to 9.8%.

Here are a few newsworthy items about companies in this sector:

- Shaw, Acme Brick, Johns Manville and MiTek were all hurt in 2007 by the sharp housing downturn, with their pre-tax earnings declining 27%, 41%, 38%, and 9% respectively. Overall, these companies earned $941 million pre-tax compared to $1.296 billion in 2006.

  Last year, Shaw, MiTek and Acme contracted for tuck-in acquisitions that will help future earnings. You can be sure they will be looking for more of these.

- In a tough year for retailing, our standouts were See's, Borsheims and Nebraska Furniture Mart.

  Two years ago Brad Kinstler was made CEO of See's. We very seldom move managers from one industry to another at Berkshire. But we made an exception with Brad, who had previously run our uniform company, Fechheimer, and Cypress Insurance. The move could not have worked out better. In his two years, profits at See's have increased more than 50%.

  At Borsheims, sales increased 15.1%, helped by a 27% gain during Shareholder Weekend. Two years ago, Susan Jacques suggested that we remodel and expand the store. I was skeptical, but Susan was right.

  Susan came to Borsheims 25 years ago as a $4-an-hour saleswoman. Though she lacked a managerial background, I did not hesitate to make her CEO in 1994. She's smart, she loves the business, and she loves her associates. That beats having an MBA degree any time.

  (An aside: Charlie and I are not big fans of resumes. Instead, we focus on brains, passion and integrity. Another of our great managers is Cathy Baron Tamraz, who has significantly increased Business Wire's earnings since we purchased it early in 2006. She is an owner's dream. It is positively *dangerous* to stand between Cathy and a business prospect. Cathy, it should be noted, began her career as a cab driver.)

  Finally, at Nebraska Furniture Mart, earnings hit a record as our Omaha and Kansas City stores each had sales of about $400 million. These, by some margin, are the two top home furnishings stores in the country. In a disastrous year for many furniture retailers, sales at Kansas City increased 8%, while in Omaha the gain was 6%.

  Credit the remarkable Blumkin brothers, Ron and Irv, for this performance. Both are close personal friends of mine and great businessmen.

- Iscar continues its wondrous ways. Its products are small carbide cutting tools that make large and very expensive machine tools more productive. The raw material for carbide is tungsten, mined in China. For many decades, Iscar moved tungsten to Israel, where brains turned it into something far more valuable. Late in 2007, Iscar opened a large plant in Dalian, China. In effect, we've now moved the brains to the tungsten. Major opportunities for growth await Iscar. Its management team, led by Eitan Wertheimer, Jacob Harpaz, and Danny Goldman, is certain to make the most of them.

- Flight services set a record in 2007 with pre-tax earnings increasing 49% to $547 million. Corporate aviation had an extraordinary year worldwide, and both of our companies – as runaway leaders in their fields – fully participated.

  FlightSafety, our pilot training business, gained 14% in revenues and 20% in pre-tax earnings. We estimate that we train about 58% of U.S. corporate pilots. Bruce Whitman, the company's CEO, inherited this leadership position in 2003 from Al Ueltschi, the father of advanced flight training, and has proved to be a worthy successor.

At NetJets, the inventor of fractional-ownership of jets, we also remain the unchallenged leader. We now operate 487 planes in the U.S. and 135 in Europe, a fleet more than twice the size of that operated by our three major competitors *combined*. Because our share of the large-cabin market is near 90%, our lead in value terms is far greater.

The NetJets brand – with its promise of safety, service and security – grows stronger every year. Behind this is the passion of one man, Richard Santulli. If you were to pick someone to join you in a foxhole, you couldn't do better than Rich. No matter what the obstacles, he just doesn't stop.

Europe is the best example of how Rich's tenacity leads to success. For the first ten years we made little financial progress there, actually running up cumulative losses of $212 million. After Rich brought Mark Booth on board to run Europe, however, we began to gain traction. Now we have real momentum, and last year earnings tripled.

In November, our directors met at NetJets headquarters in Columbus and got a look at the sophisticated operation there. It is responsible for 1,000 or so flights a day in all kinds of weather, with customers expecting top-notch service. Our directors came away impressed by the facility and its capabilities – but even more impressed by Rich and his associates.

Finance and Finance Products

Our major operation in this category is Clayton Homes, the largest U.S. manufacturer and marketer of manufactured homes. Clayton's market share hit a record 31% last year. But industry volume continues to shrink: Last year, manufactured home sales were 96,000, down from 131,000 in 2003, the year we bought Clayton. (At the time, it should be remembered, some commentators criticized its directors for selling at a cyclical bottom.)

Though Clayton earns money from both manufacturing and retailing its homes, most of its earnings come from an $11 billion loan portfolio, covering 300,000 borrowers. That's why we include Clayton's operation in this finance section. Despite the many problems that surfaced during 2007 in real estate finance, the Clayton portfolio is performing well. Delinquencies, foreclosures and losses during the year were at rates similar to those we experienced in our previous years of ownership.

Clayton's loan portfolio is financed by Berkshire. For this funding, we charge Clayton one percentage point over Berkshire's borrowing cost – a fee that amounted to $85 million last year. Clayton's 2007 pre-tax earnings of $526 million are *after* its paying this fee. The flip side of this transaction is that Berkshire recorded $85 million as income, which is included in "other" in the following table.

	Pre-Tax Earnings (in millions)	
	2007	*2006*
Trading – ordinary income	$ 272	$ 274
Life and annuity operation	(60)	29
Leasing operations	111	182
Manufactured-housing finance (Clayton)	526	513
Other	157	159
Income before capital gains	1,006	1,157
Trading – capital gains	105	938
	$1,111	$2,095

The leasing operations tabulated are XTRA, which rents trailers, and CORT, which rents furniture. Utilization of trailers was down considerably in 2007 and that led to a drop in earnings at XTRA. That company also borrowed $400 million last year and distributed the proceeds to Berkshire. The resulting higher interest it is now paying further reduced XTRA's earnings.

Clayton, XTRA and CORT are all good businesses, very ably run by Kevin Clayton, Bill Franz and Paul Arnold. Each has made tuck-in acquisitions during Berkshire's ownership. More will come.

Investments

We show below our common stock investments at yearend, itemizing those with a market value of at least $600 million.

			12/31/07	
Shares	*Company*	*Percentage of Company Owned*	*Cost**	*Market*
			(in millions)	
151,610,700	American Express Company	13.1	$ 1,287	$ 7,887
35,563,200	Anheuser-Busch Companies, Inc.	4.8	1,718	1,861
60,828,818	Burlington Northern Santa Fe	17.5	4,731	5,063
200,000,000	The Coca-Cola Company	8.6	1,299	12,274
17,508,700	Conoco Phillips	1.1	1,039	1,546
64,271,948	Johnson & Johnson	2.2	3,943	4,287
124,393,800	Kraft Foods Inc.	8.1	4,152	4,059
48,000,000	Moody's Corporation	19.1	499	1,714

*This is our actual purchase price and also our tax basis; GAAP "cost" differs in a few cases because of write-ups or write-downs that have been required.

Overall, we are delighted by the business performance of our investees. In 2007, American Express, Coca-Cola and Procter & Gamble, three of our four largest holdings, increased per-share earnings by 12%, 14% and 14%. The fourth, Wells Fargo, had a small decline in earnings because of the popping of the real estate bubble. Nevertheless, I believe its intrinsic value increased, even if only by a minor amount.

In the strange world department, note that American Express and Wells Fargo were both organized by Henry Wells and William Fargo, Amex in 1850 and Wells in 1852. P&G and Coke began business in 1837 and 1886 respectively. Start-ups are not our game.

I should emphasize that we do not measure the progress of our investments by what their market prices do during any given year. Rather, we evaluate their performance by the two methods we apply to the businesses we own. The first test is improvement in earnings, with our making due allowance for industry conditions. The second test, more subjective, is whether their "moats" – a metaphor for the superiorities they possess that make life difficult for their competitors – have widened during the year. All of the "big four" scored positively on that test.

We made one large sale last year. In 2002 and 2003 Berkshire bought 1.3% of PetroChina for $488 million, a price that valued the entire business at about $37 billion. Charlie and I then felt that the company was worth about $100 billion. By 2007, two factors had materially increased its value: the price of oil had climbed significantly, and PetroChina's management had done a great job in building oil and gas reserves. In the second half of last year, the market value of the company rose to $275 billion, about what we thought it was worth compared to other giant oil companies. So we sold our holdings for $4 billion.

A footnote: We paid the IRS tax of $1.2 billion on our PetroChina gain. This sum paid *all* costs of the U.S. government – defense, social security, you name it – for about four hours.

* * * * * * * * * * * *

Last year I told you that Berkshire had 62 derivative contracts that I manage. (We also have a few left in the General Re runoff book.) Today, we have 94 of these, and they fall into two categories.

First, we have written 54 contracts that require us to make payments if certain bonds that are included in various high-yield indices default. These contracts expire at various times from 2009 to 2013. At yearend we had received $3.2 billion in premiums on these contracts; had paid $472 million in losses; and in the worst case (though it is extremely unlikely to occur) could be required to pay an additional $4.7 billion.

We are certain to make many more payments. But I believe that on premium revenues alone, these contracts will prove profitable, leaving aside what we can earn on the large sums we hold. Our yearend liability for this exposure was recorded at $1.8 billion and is included in "Derivative Contract Liabilities" on our balance sheet.

The second category of contracts involves various put options we have sold on four stock indices (the S&P 500 plus three foreign indices). These puts had original terms of either 15 or 20 years and were struck at the market. We have received premiums of $4.5 billion, and we recorded a liability at yearend of $4.6 billion. The puts in these contracts are exercisable *only* at their expiration dates, which occur between 2019 and 2027, and Berkshire will then need to make a payment only if the index in question is quoted at a level below that existing on the day that the put was written. Again, I believe these contracts, in aggregate, will be profitable and that we will, in addition, receive substantial income from our investment of the premiums we hold during the 15- or 20-year period.

Two aspects of our derivative contracts are particularly important. First, in all cases we hold the money, which means that we have *no* counterparty risk.

Second, accounting rules for our derivative contracts differ from those applying to our investment portfolio. In that portfolio, changes in value are applied to the net worth shown on Berkshire's balance sheet, but do not affect earnings unless we sell (or write down) a holding. Changes in the value of a derivative contract, however, must be applied each quarter to earnings.

Thus, our derivative positions will sometimes cause large swings in reported earnings, even though Charlie and I might believe the intrinsic value of these positions has changed little. He and I will not be bothered by these swings – even though they could easily amount to $1 billion or more in a quarter – and we hope you won't be either. You will recall that in our catastrophe insurance business, we are always ready to trade increased volatility in reported earnings in the short run for greater gains in net worth in the long run. That is our philosophy in derivatives as well.

* * * * * * * * * * * *

The U.S. dollar weakened further in 2007 against major currencies, and it's no mystery why: Americans like buying products made elsewhere more than the rest of the world likes buying products made in the U.S. Inevitably, that causes America to ship about $2 billion of IOUs and assets *daily* to the rest of the world. And over time, that puts pressure on the dollar.

When the dollar falls, it both makes our products cheaper for foreigners to buy and their products more expensive for U.S. citizens. That's why a falling currency is supposed to cure a trade deficit. Indeed, the U.S. deficit has undoubtedly been tempered by the large drop in the dollar. But ponder this: In 2002 when the Euro averaged 94.6¢, our trade deficit with Germany (the fifth largest of our trading partners) was $36 billion, whereas in 2007, with the Euro averaging $1.37, our deficit with Germany was up to $45 billion. Similarly, the Canadian dollar averaged 64¢ in 2002 and 93¢ in 2007. Yet our trade deficit with Canada rose as well, from $50 billion in 2002 to $64 billion in 2007. So far, at least, a plunging dollar has not done much to bring our trade activity into balance.

There's been much talk recently of sovereign wealth funds and how they are buying large pieces of American businesses. This is *our* doing, not some nefarious plot by foreign governments. Our trade equation guarantees massive foreign investment in the U.S. When we force-feed $2 billion daily to the rest of the world, they must invest in *something* here. Why should we complain when they choose stocks over bonds?

Our country's weakening currency is not the fault of OPEC, China, etc. Other developed countries rely on imported oil and compete against Chinese imports just as we do. In developing a sensible trade policy, the U.S. should not single out countries to punish or industries to protect. Nor should we take actions likely to evoke retaliatory behavior that will reduce America's exports, true trade that benefits both our country and the rest of the world.

Our legislators should recognize, however, that the current imbalances are unsustainable and should therefore adopt policies that will materially reduce them sooner rather than later. Otherwise our $2 billion daily of force-fed dollars to the rest of the world may produce global indigestion of an unpleasant sort. (For other comments about the unsustainability of our trade deficits, see Alan Greenspan's comments on November 19, 2004, the Federal Open Market Committee's minutes of June 29, 2004, and Ben Bernanke's statement on September 11, 2007.)

* * * * * * * * * * * *

At Berkshire we held only one direct currency position during 2007. That was in – hold your breath – the Brazilian real. Not long ago, swapping dollars for reals would have been unthinkable. After all, during the past century *five* versions of Brazilian currency have, in effect, turned into confetti. As has been true in many countries whose currencies have periodically withered and died, wealthy Brazilians sometimes stashed large sums in the U.S. to preserve their wealth.

But any Brazilian who followed this apparently prudent course would have lost *half* his net worth over the past five years. Here's the year-by-year record (indexed) of the real versus the dollar from the end of 2002 to yearend 2007: 100; 122; 133; 152; 166; 199. Every year the real went up and the dollar fell. Moreover, during much of this period the Brazilian government was actually holding down the value of the real and supporting *our* currency by buying dollars in the market.

Our direct currency positions have yielded $2.3 billion of pre-tax profits over the past five years, and in addition we have profited by holding bonds of U.S. companies that are denominated in other currencies. For example, in 2001 and 2002 we purchased €310 million Amazon.com, Inc. 6 7/8 of 2010 at 57% of par. At the time, Amazon bonds were priced as "junk" credits, though they were anything but. (Yes, Virginia, you can occasionally find markets that are ridiculously inefficient – or at least you can find them anywhere except at the finance departments of some leading business schools.)

The Euro denomination of the Amazon bonds was a further, and important, attraction for us. The Euro was at 95¢ when we bought in 2002. Therefore, our cost in dollars came to only $169 million. Now the bonds sell at 102% of par and the Euro is worth $1.47. In 2005 and 2006 some of our bonds were called and we received $253 million for them. Our remaining bonds were valued at $162 million at yearend. Of our $246 million of realized and unrealized gain, about $118 million is attributable to the fall in the dollar. Currencies do matter.

At Berkshire, we will attempt to further increase our stream of direct and indirect foreign earnings. Even if we are successful, however, our assets and earnings will always be concentrated in the U.S. Despite our country's many imperfections and unrelenting problems of one sort or another, America's rule of law, market-responsive economic system, and belief in meritocracy are almost certain to produce ever-growing prosperity for its citizens.

* * * * * * * * * * * *

As I have told you before, we have for some time been well-prepared for CEO succession because we have three outstanding internal candidates. The board knows exactly whom it would pick if I were to become unavailable, either because of death or diminishing abilities. And that would still leave the board with two backups.

Last year I told you that we would also promptly complete a succession plan for the investment job at Berkshire, and we have indeed now identified four candidates who could succeed me in managing investments. All manage substantial sums currently, and all have indicated a strong interest in coming to Berkshire if called. The board knows the strengths of the four and would expect to hire one or more if the need arises. The candidates are young to middle-aged, well-to-do to rich, and all wish to work for Berkshire for reasons that go beyond compensation.

(I've reluctantly discarded the notion of my continuing to manage the portfolio after my death – abandoning my hope to give new meaning to the term "thinking outside the box.")

Fanciful Figures – How Public Companies Juice Earnings

Former Senator Alan Simpson famously said: "Those who travel the high road in Washington need not fear heavy traffic." If he had sought truly deserted streets, however, the Senator should have looked to Corporate America's accounting.

An important referendum on which road businesses prefer occurred in 1994. America's CEOs had just strong-armed the U.S. Senate into ordering the Financial Accounting Standards Board to shut up, by a vote that was 88-9. Before that rebuke the FASB had shown the audacity – by unanimous agreement, no less – to tell corporate chieftains that the stock options they were being awarded represented a form of compensation and that their value should be recorded as an expense.

After the senators voted, the FASB – now educated on accounting principles by the Senate's 88 closet CPAs – decreed that companies could choose between two methods of reporting on options. The *preferred* treatment would be to expense their value, but it would also be allowable for companies to ignore the expense as long as their options were issued at market value.

A moment of truth had now arrived for America's CEOs, and their reaction was not a pretty sight. During the next six years, exactly *two* of the 500 companies in the S&P chose the preferred route. CEOs of the rest opted for the low road, thereby ignoring a large and obvious expense in order to report higher "earnings." I'm sure some of them also felt that if they opted for expensing, their directors might in future years think twice before approving the mega-grants the managers longed for.

It turned out that for many CEOs even the low road wasn't good enough. Under the weakened rule, there remained earnings consequences if options were issued with a strike price below market value. No problem. To avoid that bothersome rule, a number of companies surreptitiously backdated options to falsely indicate that they were granted at current market prices, when in fact they were dished out at prices well below market.

Decades of option-accounting nonsense have now been put to rest, but other accounting choices remain – important among these the investment-return assumption a company uses in calculating pension expense. It will come as no surprise that many companies continue to choose an assumption that allows them to report less-than-solid "earnings." For the 363 companies in the S&P that have pension plans, this assumption in 2006 averaged 8%. Let's look at the chances of that being achieved.

The average holdings of bonds and cash for all pension funds is about 28%, and on these assets returns can be expected to be no more than 5%. Higher yields, of course, are obtainable but they carry with them a risk of commensurate (or greater) loss.

This means that the remaining 72% of assets – which are mostly in equities, either held directly or through vehicles such as hedge funds or private-equity investments – must earn 9.2% in order for the fund overall to achieve the postulated 8%. And that return must be delivered *after* all fees, which are now far higher than they have ever been.

How realistic is this expectation? Let's revisit some data I mentioned two years ago: During the 20th Century, the Dow advanced from 66 to 11,497. This gain, though it appears huge, shrinks to 5.3% when compounded annually. An investor who owned the Dow throughout the century would also have received generous dividends for much of the period, but only about 2% or so in the final years. It was a wonderful century.

Think now about *this* century. For investors to merely match that 5.3% market-value gain, the Dow – recently below 13,000 – would need to close at about *2,000,000* on December 31, 2099. We are now eight years into this century, and we have racked up less than 2,000 of the 1,988,000 Dow points the market needed to travel in this hundred years to equal the 5.3% of the last.

It's amusing that commentators regularly hyperventilate at the prospect of the Dow crossing an even number of thousands, such as 14,000 or 15,000. If they keep reacting that way, a 5.3% annual gain for the century will mean they experience at least 1,986 seizures during the next 92 years. While anything is possible, does anyone really believe this is the most likely outcome?

Dividends continue to run about 2%. Even if stocks were to average the 5.3% annual appreciation of the 1900s, the equity portion of plan assets – allowing for expenses of .5% – would produce no more than 7% or so. And .5% may well understate costs, given the presence of layers of consultants and high-priced managers ("helpers").

Naturally, everyone expects to be above average. And those helpers – bless their hearts – will certainly encourage their clients in this belief. But, as a class, the helper-aided group must be *below* average. The reason is simple: 1) Investors, overall, will necessarily earn an average return, minus costs they incur; 2) Passive and index investors, through their very inactivity, will earn that average minus costs that are very low; 3) With that group earning average returns, so must the remaining group – the active investors. But this group will incur high transaction, management, and advisory costs. Therefore, the active investors will have their returns diminished by a far greater percentage than will their inactive brethren. That means that the passive group – the "know-nothings" – must win.

I should mention that people who expect to earn 10% annually from equities during this century – envisioning that 2% of that will come from dividends and 8% from price appreciation – are implicitly forecasting a level of about *24,000,000* on the Dow by 2100. If your adviser talks to you about double-digit returns from equities, explain this math to him – not that it will faze him. Many helpers are apparently direct descendants of the queen in Alice in Wonderland, who said: "Why, sometimes I've believed as many as six impossible things before breakfast." Beware the glib helper who fills your head with fantasies while he fills his pockets with fees.

Some companies have pension plans in Europe as well as in the U.S. and, in their accounting, almost all assume that the U.S. plans will earn more than the non-U.S. plans. This discrepancy is puzzling: Why should these companies not put their U.S. managers in charge of the non-U.S. pension assets and let them work their magic on these assets as well? I've never seen this puzzle explained. But the auditors and actuaries who are charged with vetting the return assumptions seem to have no problem with it.

What is no puzzle, however, is why CEOs opt for a high investment assumption: It lets them report higher earnings. And if they are wrong, as I believe they are, the chickens won't come home to roost until long after they retire.

After decades of pushing the envelope – or worse – in its attempt to report the highest number possible for current earnings, Corporate America should ease up. It should listen to my partner, Charlie: "If you've hit three balls out of bounds to the left, aim a little to the right on the next swing."

* * * * * * * * * * * *

Whatever pension-cost surprises are in store for shareholders down the road, these jolts will be surpassed many times over by those experienced by taxpayers. Public pension promises are huge and, in many cases, funding is woefully inadequate. Because the fuse on this time bomb is long, politicians flinch from inflicting tax pain, given that problems will only become apparent long after these officials have departed. Promises involving very early retirement – sometimes to those in their low 40s – and generous cost-of-living adjustments are easy for these officials to make. In a world where people are living longer and inflation is certain, those promises will be anything but easy to keep.

* * * * * * * * * * * *

Having laid out the failures of an "honor system" in American accounting, I need to point out that this is exactly the system existing at Berkshire for a truly huge balance-sheet item. In every report we make to you, we must guesstimate the loss reserves for our insurance units. If our estimate is wrong, it means that both our balance sheet and our earnings statement will be wrong. So naturally we do our best to make these guesses accurate. *Nevertheless, in every report our estimate is sure to be wrong*.

At yearend 2007, we show an insurance liability of $56 billion that represents our guess as to what we will eventually pay for all loss events that occurred before yearend (except for about $3 billion of the reserve that has been discounted to present value). We know of many thousands of events and have put a dollar value on each that reflects what we believe we will pay, including the associated costs (such as attorney's fees) that we will incur in the payment process. In some cases, among them claims for certain serious injuries covered by worker's compensation, payments will be made for 50 years or more.

We also include a large reserve for losses that occurred before yearend but that we have yet to hear about. Sometimes, the insured itself does not know that a loss has occurred. (Think of an embezzlement that remains undiscovered for years.) We sometimes hear about losses from policies that covered our insured many decades ago.

A story I told you some years back illustrates our problem in accurately estimating our loss liability: A fellow was on an important business trip in Europe when his sister called to tell him that their dad had died. Her brother explained that he couldn't get back but said to spare nothing on the funeral, whose cost he would cover. When he returned, his sister told him that the service had been beautiful and presented him with bills totaling $8,000. He paid up but a month later received a bill from the mortuary for $10. He paid that, too – and still another $10 charge he received a month later. When a third $10 invoice was sent to him the following month, the perplexed man called his sister to ask what was going on. "Oh," she replied, "I forgot to tell you. We buried Dad in a rented suit."

At our insurance companies we have an unknown, but most certainly large, number of "rented suits" buried around the world. We try to estimate the bill for them accurately. In ten or twenty years, we will even be able to make a good guess as to how inaccurate our present guess is. But even *that* guess will be subject to surprises. I personally believe our stated reserves are adequate, but I've been wrong several times in the past.

The Annual Meeting

Our meeting this year will be held on Saturday, May 3rd. As always, the doors will open at the Qwest Center at 7 a.m., and a new Berkshire movie will be shown at 8:30. At 9:30 we will go directly to the question-and-answer period, which (with a break for lunch at the Qwest's stands) will last until 3:00. Then, after a short recess, Charlie and I will convene the annual meeting at 3:15. If you decide to leave during the day's question periods, please do so while *Charlie* is talking.

The best reason to exit, of course is to *shop*. We will help you do that by filling the 194,300-square-foot hall that adjoins the meeting area with the products of Berkshire subsidiaries. Last year, the 27,000 people who came to the meeting did their part, and almost every location racked up record sales. But you can do better. (If necessary, I'll lock the doors.)

This year we will again showcase a Clayton home (featuring Acme brick, Shaw carpet, Johns Manville insulation, MiTek fasteners, Carefree awnings and NFM furniture). You will find that this 1,550-square-foot home, priced at $69,500, delivers exceptional value. And after you purchase the house, consider also acquiring the Forest River RV and pontoon boat on display nearby.

GEICO will have a booth staffed by a number of its top counselors from around the country, all of them ready to supply you with auto insurance quotes. In most cases, GEICO will be able to give you a special shareholder discount (usually 8%). This special offer is permitted by 45 of the 50 jurisdictions in which we operate. (One supplemental point: The discount is not additive if you qualify for another, such as that given certain groups.) Bring the details of your existing insurance and check out whether we can save you money. For at least 50% of you, I believe we can.

On Saturday, at the Omaha airport, we will have the usual array of aircraft from NetJets available for your inspection. Stop by the NetJets booth at the Qwest to learn about viewing these planes. Come to Omaha by bus; leave in your new plane. And take all the hair gel and scissors that you wish on board with you.

Next, if you have any money left, visit the Bookworm, where you will find about 25 books and DVDs – all discounted – led again by *Poor Charlie's Almanack*. Without any advertising or bookstore placement, Charlie's book has now remarkably sold nearly 50,000 copies. For those of you who can't make the meeting, go to poorcharliesalmanack.com to order a copy.

An attachment to the proxy material that is enclosed with this report explains how you can obtain the credential you will need for admission to the meeting and other events. As for plane, hotel and car reservations, we have again signed up American Express (800-799-6634) to give you special help. Carol Pedersen, who handles these matters, does a terrific job for us each year, and I thank her for it. Hotel rooms can be hard to find, but work with Carol and you will get one.

At Nebraska Furniture Mart, located on a 77-acre site on 72nd Street between Dodge and Pacific, we will again be having "Berkshire Weekend" discount pricing. We initiated this special event at NFM eleven years ago, and sales during the "Weekend" grew from $5.3 million in 1997 to $30.9 million in 2007. This is more volume than most furniture stores register in a year.

To obtain the Berkshire discount, you must make your purchases between Thursday, May 1st and Monday, May 5th inclusive, and also present your meeting credential. The period's special pricing will even apply to the products of several prestigious manufacturers that normally have ironclad rules against discounting but which, in the spirit of our shareholder weekend, have made an exception for you. We appreciate their cooperation. NFM is open from 10 a.m. to 9 p.m. Monday through Saturday, and 10 a.m. to 6 p.m. on Sunday. On Saturday this year, from 5:30 p.m. to 8 p.m., NFM is having a Baja Beach Bash featuring beef and chicken tacos.

At Borsheims, we will again have two shareholder-only events. The first will be a cocktail reception from 6 p.m. to 10 p.m. on Friday, May 2nd. The second, the main gala, will be held on Sunday, May 4th, from 9 a.m. to 4 p.m. On Saturday, we will be open until 6 p.m.

We will have huge crowds at Borsheims throughout the weekend. For your convenience, therefore, shareholder prices will be available from Monday, April 28th through Saturday, May 10th. During that period, please identify yourself as a shareholder by presenting your meeting credentials or a brokerage statement that shows you are a Berkshire holder.

On Sunday, in a tent outside of Borsheims, a blindfolded Patrick Wolff, twice U.S. chess champion, will take on all comers – who will have their eyes wide open – in groups of six. Nearby, Norman Beck, a remarkable magician from Dallas, will bewilder onlookers. Additionally, we will have Bob Hamman and Sharon Osberg, two of the world's top bridge experts, available to play bridge with our shareholders on Sunday afternoon.

Gorat's will again be open exclusively for Berkshire shareholders on Sunday, May 4th, and will be serving from 4 p.m. until 10 p.m. Last year Gorat's, which seats 240, served 915 dinners on Shareholder Sunday. The three-day total was 2,487 including 656 T-bone steaks, the entrée preferred by the *cognoscenti*. Please remember that to come to Gorat's on that day, you must have a reservation. To make one, call 402-551-3733 on April 1st (*but not before*).

We will again have a reception at 4 p.m. on Saturday afternoon for shareholders who have come from outside of North America. Every year our meeting draws many people from around the globe, and Charlie and I want to be sure we personally greet those who have come so far. Last year we enjoyed meeting more than 400 of you from many dozens of countries. Any shareholder who comes from other than the U.S. or Canada will be given a special credential and instructions for attending this function.

* * * * * * * * * * * *

At 84 and 77, Charlie and I remain lucky beyond our dreams. We were born in America; had terrific parents who saw that we got good educations; have enjoyed wonderful families and great health; and came equipped with a "business" gene that allows us to prosper in a manner hugely disproportionate to that experienced by many people who contribute as much or more to our society's well-being. Moreover, we have long had jobs that we love, in which we are helped in countless ways by talented and cheerful associates. Every day is exciting to us; no wonder we tap-dance to work. But nothing is more fun for us than getting together with our shareholder-partners at Berkshire's annual meeting. So join us on May 3rd at the Qwest for our annual Woodstock for Capitalists. We'll see you there.

February 2008

Warren E. Buffett
Chairman of the Board

Berkshire's Corporate Performance vs. the S&P 500

Year	Annual Percentage Change in Per-Share Book Value of Berkshire (1)	Annual Percentage Change in S&P 500 with Dividends Included (2)	Relative Results (1)-(2)
1965	23.8	10.0	13.8
1966	20.3	(11.7)	32.0
1967	11.0	30.9	(19.9)
1968	19.0	11.0	8.0

2008	(9.6)	(37.0)	27.4
Compounded Annual Gain – 1965-2008	20.3%	8.9%	11.4
Overall Gain – 1964-2008	362,319%	4,276%	

Notes: Data are for calendar years with these exceptions: 1965 and 1966, year ended 9/30; 1967, 15 months ended 12/31.

Starting in 1979, accounting rules required insurance companies to value the equity securities they hold at market rather than at the lower of cost or market, which was previously the requirement. In this table, Berkshire's results through 1978 have been restated to conform to the changed rules. In all other respects, the results are calculated using the numbers originally reported.

The S&P 500 numbers are **pre-tax** whereas the Berkshire numbers are **after-tax**. If a corporation such as Berkshire were simply to have owned the S&P 500 and accrued the appropriate taxes, its results would have lagged the S&P 500 in years when that index showed a positive return, but would have exceeded the S&P 500 in years when the index showed a negative return. Over the years, the tax costs would have caused the aggregate lag to be substantial.

BERKSHIRE HATHAWAY INC.

To the Shareholders of Berkshire Hathaway Inc.:

Our *decrease* in net worth during 2008 was $11.5 billion, which reduced the per-share book value of both our Class A and Class B stock by 9.6%. Over the last 44 years (that is, since present management took over) book value has grown from $19 to $70,530, a rate of 20.3% compounded annually.*

The table on the preceding page, recording both the 44-year performance of Berkshire's book value and the S&P 500 index, shows that 2008 was the worst year for each. The period was devastating as well for corporate and municipal bonds, real estate and commodities. By yearend, investors of all stripes were bloodied and confused, much as if they were small birds that had strayed into a badminton game.

As the year progressed, a series of life-threatening problems within many of the world's great financial institutions was unveiled. This led to a dysfunctional credit market that in important respects soon turned non-functional. The watchword throughout the country became the creed I saw on restaurant walls when I was young: "In God we trust; all others pay cash."

By the fourth quarter, the credit crisis, coupled with tumbling home and stock prices, had produced a paralyzing fear that engulfed the country. A freefall in business activity ensued, accelerating at a pace that I have never before witnessed. The U.S. – and much of the world – became trapped in a vicious negative-feedback cycle. Fear led to business contraction, and that in turn led to even greater fear.

This debilitating spiral has spurred our government to take massive action. In poker terms, the Treasury and the Fed have gone "all in." Economic medicine that was previously meted out by the cupful has recently been dispensed by the barrel. These once-unthinkable dosages will almost certainly bring on unwelcome aftereffects. Their precise nature is anyone's guess, though one likely consequence is an onslaught of inflation. Moreover, major industries have become dependent on Federal assistance, and they will be followed by cities and states bearing mind-boggling requests. Weaning these entities from the public teat will be a political challenge. They won't leave willingly.

Whatever the downsides may be, strong and immediate action by government was essential last year if the financial system was to avoid a total breakdown. Had one occurred, the consequences for every area of our economy would have been cataclysmic. Like it or not, the inhabitants of Wall Street, Main Street and the various Side Streets of America were all in the same boat.

Amid this bad news, however, never forget that our country has faced far worse travails in the past. In the 20th Century alone, we dealt with two great wars (one of which we initially appeared to be losing); a dozen or so panics and recessions; virulent inflation that led to a 21½% prime rate in 1980; and the Great Depression of the 1930s, when unemployment ranged between 15% and 25% for many years. America has had no shortage of challenges.

Without fail, however, we've overcome them. In the face of those obstacles – and many others – the real standard of living for Americans improved nearly *seven*-fold during the 1900s, while the Dow Jones Industrials rose from 66 to 11,497. Compare the record of this period with the dozens of centuries during which humans secured only tiny gains, if any, in how they lived. Though the path has not been smooth, our economic system has worked extraordinarily well over time. It has unleashed human potential as no other system has, and it will continue to do so. America's best days lie ahead.

---

*All per-share figures used in this report apply to Berkshire's A shares. Figures for the B shares are 1/30th of those shown for A.

Take a look again at the 44-year table on page 2. In 75% of those years, the S&P stocks recorded a gain. I would guess that a roughly similar percentage of years will be positive in the next 44. But neither Charlie Munger, my partner in running Berkshire, nor I can predict the winning and losing years in advance. (In our usual opinionated view, we don't think anyone else can either.) We're certain, for example, that the economy will be in shambles throughout 2009 – and, for that matter, probably well beyond – but that conclusion does not tell us whether the stock market will rise or fall.

In good years and bad, Charlie and I simply focus on four goals:

(1) maintaining Berkshire's Gibraltar-like financial position, which features huge amounts of excess liquidity, near-term obligations that are modest, and dozens of sources of earnings and cash;

(2) widening the "moats" around our operating businesses that give them durable competitive advantages;

(3) acquiring and developing new and varied streams of earnings;

(4) expanding and nurturing the cadre of outstanding operating managers who, over the years, have delivered Berkshire exceptional results.

Berkshire in 2008

Most of the Berkshire businesses whose results are significantly affected by the economy earned below their potential last year, and that will be true in 2009 as well. Our retailers were hit particularly hard, as were our operations tied to residential construction. In aggregate, however, our manufacturing, service and retail businesses earned substantial sums and most of them – particularly the larger ones – continue to strengthen their competitive positions. Moreover, we are fortunate that Berkshire's two most important businesses – our insurance and utility groups – produce earnings that are not correlated to those of the general economy. Both businesses delivered outstanding results in 2008 and have excellent prospects.

As predicted in last year's report, the exceptional underwriting profits that our insurance businesses realized in 2007 were not repeated in 2008. Nevertheless, the insurance group delivered an underwriting gain for the sixth consecutive year. This means that our $58.5 billion of insurance "float" – money that doesn't belong to us but that we hold and invest for our own benefit – cost us less than zero. In fact, we were *paid* $2.8 billion to hold our float during 2008. Charlie and I find this enjoyable.

Over time, most insurers experience a substantial underwriting loss, which makes their economics far different from ours. Of course, we too will experience underwriting losses in some years. But we have the best group of managers in the insurance business, and in most cases they oversee entrenched and valuable franchises. Considering these strengths, I believe that we will earn an underwriting profit over the years and that our float will therefore cost us nothing. Our insurance operation, the core business of Berkshire, is an economic powerhouse.

Charlie and I are equally enthusiastic about our utility business, which had record earnings last year and is poised for future gains. Dave Sokol and Greg Abel, the managers of this operation, have achieved results unmatched elsewhere in the utility industry. I love it when they come up with new projects because in this capital-intensive business these ventures are often large. Such projects offer Berkshire the opportunity to put out substantial sums at decent returns.

Things also went well on the capital-allocation front last year. Berkshire is always a buyer of both businesses and securities, and the disarray in markets gave us a tailwind in our purchases. When investing, pessimism is your friend, euphoria the enemy.

In our insurance portfolios, we made three large investments on terms that would be unavailable in normal markets. These should add about $1½ billion pre-tax to Berkshire's annual earnings and offer possibilities for capital gains as well. We also closed on our Marmon acquisition (we own 64% of the company now and will purchase its remaining stock over the next six years). Additionally, certain of our subsidiaries made "tuck-in" acquisitions that will strengthen their competitive positions and earnings.

That's the good news. But there's another less pleasant reality: During 2008 I did some dumb things in investments. I made at least one major mistake of commission and several lesser ones that also hurt. I will tell you more about these later. Furthermore, I made some errors of omission, sucking my thumb when new facts came in that should have caused me to re-examine my thinking and promptly take action.

Additionally, the market value of the bonds and stocks that we continue to hold suffered a significant decline along with the general market. This does not bother Charlie and me. Indeed, we enjoy such price declines if we have funds available to increase our positions. Long ago, Ben Graham taught me that "Price is what you pay; value is what you get." Whether we're talking about socks or stocks, I like buying quality merchandise when it is marked down.

Yardsticks

Berkshire has two major areas of value. The first is our investments: stocks, bonds and cash equivalents. At yearend those totaled $122 billion (not counting the investments held by our finance and utility operations, which we assign to our second bucket of value). About $58.5 billion of that total is funded by our insurance float.

Berkshire's second component of value is earnings that come from sources other than investments and insurance. These earnings are delivered by our 67 non-insurance companies, itemized on page 96. We exclude our insurance earnings from this calculation because the value of our insurance operation comes from the investable funds it generates, and we have already included this factor in our first bucket.

In 2008, our investments fell from $90,343 per share of Berkshire (after minority interest) to $77,793, a decrease that was caused by a decline in market prices, not by net sales of stocks or bonds. Our second segment of value fell from pre-tax earnings of $4,093 per Berkshire share to $3,921 (again after minority interest).

Both of these performances are unsatisfactory. Over time, we need to make decent gains in each area if we are to increase Berkshire's intrinsic value at an acceptable rate. Going forward, however, our focus will be on the earnings segment, just as it has been for several decades. We like buying underpriced securities, but we like buying fairly-priced operating businesses even more.

Now, let's take a look at the four major operating sectors of Berkshire. Each of these has vastly different balance sheet and income account characteristics. Therefore, lumping them together, as is done in standard financial statements, impedes analysis. So we'll present them as four separate businesses, which is how Charlie and I view them.

Regulated Utility Business

Berkshire has an 87.4% (diluted) interest in MidAmerican Energy Holdings, which owns a wide variety of utility operations. The largest of these are (1) Yorkshire Electricity and Northern Electric, whose 3.8 million end users make it the U.K.'s third largest distributor of electricity; (2) MidAmerican Energy, which serves 723,000 electric customers, primarily in Iowa; (3) Pacific Power and Rocky Mountain Power, serving about 1.7 million electric customers in six western states; and (4) Kern River and Northern Natural pipelines, which carry about 9% of the natural gas consumed in the U.S.

Our partners in ownership of MidAmerican are its two terrific managers, Dave Sokol and Greg Abel, and my long-time friend, Walter Scott. It's unimportant how many votes each party has; we make major moves only when we are unanimous in thinking them wise. Nine years of working with Dave, Greg and Walter have reinforced my original belief: Berkshire couldn't have better partners.

Somewhat incongruously, MidAmerican also owns the second largest real estate brokerage firm in the U.S., HomeServices of America. This company operates through 21 locally-branded firms that have 16,000 agents. Last year was a terrible year for home sales, and 2009 looks no better. We will continue, however, to acquire quality brokerage operations when they are available at sensible prices.

Here are some key figures on MidAmerican's operations:

	Earnings (in millions)	
	2008	*2007*
U.K. utilities	$ 339	$ 337
Iowa utility	425	412
Western utilities	703	692
Pipelines	595	473
HomeServices	(45)	42
Other (net)	186	130
Operating earnings before corporate interest and taxes	2,203	2,086
Constellation Energy*	1,092	–
Interest, other than to Berkshire	(332)	(312)
Interest on Berkshire junior debt	(111)	(108)
Income tax	(1,002)	(477)
Net earnings	$ 1,850	$ 1,189
Earnings applicable to Berkshire**	$ 1,704	$ 1,114
Debt owed to others	19,145	19,002
Debt owed to Berkshire	1,087	821

*Consists of a breakup fee of $175 million and a profit on our investment of $917 million.
**Includes interest earned by Berkshire (net of related income taxes) of $72 in 2008 and $70 in 2007.

MidAmerican's record in operating its regulated electric utilities and natural gas pipelines is truly outstanding. Here's some backup for that claim.

Our two pipelines, Kern River and Northern Natural, were both acquired in 2002. A firm called Mastio regularly ranks pipelines for customer satisfaction. Among the 44 rated, Kern River came in 9th when we purchased it and Northern Natural ranked 39th. There was work to do.

In Mastio's 2009 report, Kern River ranked 1st and Northern Natural 3rd. Charlie and I couldn't be more proud of this performance. It came about because hundreds of people at each operation committed themselves to a new culture and then delivered on their commitment.

Achievements at our electric utilities have been equally impressive. In 1995, MidAmerican became the major provider of electricity in Iowa. By judicious planning and a zeal for efficiency, the company has kept electric prices unchanged since our purchase and has promised to hold them steady through 2013.

MidAmerican has maintained this extraordinary price stability while making Iowa number one among all states in the percentage of its generation capacity that comes from wind. Since our purchase, MidAmerican's wind-based facilities have grown from zero to almost 20% of total capacity.

Similarly, when we purchased PacifiCorp in 2006, we moved aggressively to expand wind generation. Wind capacity was then 33 megawatts. It's now 794, with more coming. (Arriving at PacifiCorp, we found "wind" of a different sort: The company had 98 committees that met frequently. Now there are 28. Meanwhile, we generate and deliver considerably more electricity, doing so with 2% fewer employees.)

In 2008 alone, MidAmerican spent $1.8 billion on wind generation at our two operations, and today the company is number one in the nation among regulated utilities in ownership of wind capacity. By the way, compare that $1.8 billion to the $1.1 billion of pre-tax earnings of PacifiCorp (shown in the table as "Western") and Iowa. In our utility business, we spend all we earn, and then some, in order to fulfill the needs of our service areas. Indeed, MidAmerican has not paid a dividend since Berkshire bought into the company in early 2000. Its earnings have instead been reinvested to develop the utility systems our customers require and deserve. In exchange, we have been allowed to earn a fair return on the huge sums we have invested. It's a great partnership for all concerned.

* * * * * * * * * * * *

Our long-avowed goal is to be the "buyer of choice" for businesses – particularly those built and owned by families. The way to achieve this goal is to deserve it. That means we must keep our promises; avoid leveraging up acquired businesses; grant unusual autonomy to our managers; and hold the purchased companies through thick and thin (though we prefer thick and thicker).

Our record matches our rhetoric. Most buyers competing against us, however, follow a different path. For them, acquisitions are "merchandise." Before the ink dries on their purchase contracts, these operators are contemplating "exit strategies." We have a decided advantage, therefore, when we encounter sellers who truly care about the future of their businesses.

Some years back our competitors were known as "leveraged-buyout operators." But LBO became a bad name. So in Orwellian fashion, the buyout firms decided to change their moniker. What they did not change, though, were the essential ingredients of their previous operations, including their cherished fee structures and love of leverage.

Their new label became "private equity," a name that turns the facts upside-down: A purchase of a business by these firms almost invariably results in dramatic *reductions* in the equity portion of the acquiree's capital structure compared to that previously existing. A number of these acquirees, purchased only two to three years ago, are now in mortal danger because of the debt piled on them by their private-equity buyers. Much of the bank debt is selling below 70¢ on the dollar, and the public debt has taken a far greater beating. The private-equity firms, it should be noted, are not rushing in to inject the equity their wards now desperately need. Instead, they're keeping their remaining funds *very* private.

In the regulated utility field there are no large family-owned businesses. Here, Berkshire hopes to be the "buyer of choice" of *regulators*. It is they, rather than selling shareholders, who judge the fitness of purchasers when transactions are proposed.

There is no hiding your history when you stand before these regulators. They can – and do – call their counterparts in other states where you operate and ask how you have behaved in respect to all aspects of the business, including a willingness to commit adequate equity capital.

When MidAmerican proposed its purchase of PacifiCorp in 2005, regulators in the six new states we would be serving immediately checked our record in Iowa. They also carefully evaluated our financing plans and capabilities. We passed this examination, just as we expect to pass future ones.

There are two reasons for our confidence. First, Dave Sokol and Greg Abel are going to run any businesses with which they are associated in a first-class manner. They don't know of any other way to operate. Beyond that is the fact that we hope to buy more regulated utilities in the future – and we know that our business behavior in jurisdictions where we are operating today will determine how we are welcomed by new jurisdictions tomorrow.

Insurance

Our insurance group has propelled Berkshire's growth since we first entered the business in 1967. This happy result has not been due to general prosperity in the industry. During the 25 years ending in 2007, return on net worth for insurers averaged 8.5% versus 14.0% for the Fortune 500. Clearly our insurance CEOs have not had the wind at their back. Yet these managers have excelled to a degree Charlie and I never dreamed possible in the early days. Why do I love them? Let me count the ways.

At GEICO, Tony Nicely – now in his 48th year at the company after joining it when he was 18 – continues to gobble up market share while maintaining disciplined underwriting. When Tony became CEO in 1993, GEICO had 2.0% of the auto insurance market, a level at which the company had long been stuck. Now we have a 7.7% share, up from 7.2% in 2007.

The combination of new business gains and an improvement in the renewal rate on existing business has moved GEICO into the number three position among auto insurers. In 1995, when Berkshire purchased control, GEICO was number seven. Now we trail only State Farm and Allstate.

GEICO grows because it saves money for motorists. No one *likes* to buy auto insurance. But virtually everyone likes to drive. So, sensibly, drivers look for the lowest-cost insurance consistent with first-class service. Efficiency is the key to low cost, and efficiency is Tony's specialty. Five years ago the number of policies per employee was 299. In 2008, the number was 439, a huge increase in productivity.

As we view GEICO's current opportunities, Tony and I feel like two hungry mosquitoes in a nudist camp. Juicy targets are everywhere. First, and most important, our new business in auto insurance is now exploding. Americans are focused on saving money as never before, and they are flocking to GEICO. In January 2009, we set a monthly record – by a wide margin – for growth in policyholders. That record will last exactly 28 days: As we go to press, it's clear February's gain will be even better.

Beyond this, we are gaining ground in allied lines. Last year, our motorcycle policies increased by 23.4%, which raised our market share from about 6% to more than 7%. Our RV and ATV businesses are also growing rapidly, albeit from a small base. And, finally, we recently began insuring commercial autos, a big market that offers real promise.

GEICO is now saving money for millions of Americans. Go to GEICO.com or call 1-800-847-7536 and see if we can save you money as well.

General Re, our large international reinsurer, also had an outstanding year in 2008. Some time back, the company had serious problems (which I totally failed to detect when we purchased it in late 1998). By 2001, when Joe Brandon took over as CEO, assisted by his partner, Tad Montross, General Re's culture had further deteriorated, exhibiting a loss of discipline in underwriting, reserving and expenses. After Joe and Tad took charge, these problems were decisively and successfully addressed. Today General Re has regained its luster. Last spring Joe stepped down, and Tad became CEO. Charlie and I are grateful to Joe for righting the ship and are certain that, with Tad, General Re's future is in the best of hands.

Reinsurance is a business of long-term promises, sometimes extending for fifty years or more. This past year has retaught clients a crucial principle: A promise is no better than the person or institution making it. That's where General Re excels: It is the *only* reinsurer that is backed by an AAA corporation. Ben Franklin once said, "It's difficult for an empty sack to stand upright." That's no worry for General Re clients.

Our third major insurance operation is Ajit Jain's reinsurance division, headquartered in Stamford and staffed by only 31 employees. This may be one of the most remarkable businesses in the world, hard to characterize but easy to admire.

From year to year, Ajit's business is never the same. It features very large transactions, incredible speed of execution and a willingness to quote on policies that leave others scratching their heads. When there is a huge and unusual risk to be insured, Ajit is almost certain to be called.

Ajit came to Berkshire in 1986. Very quickly, I realized that we had acquired an extraordinary talent. So I did the logical thing: I wrote his parents in New Delhi and asked if they had another one like him at home. Of course, I knew the answer before writing. There *isn't* anyone like Ajit.

Our smaller insurers are just as outstanding in their own way as the "big three," regularly delivering valuable float to us at a negative cost. We aggregate their results below under "Other Primary." For space reasons, we don't discuss these insurers individually. But be assured that Charlie and I appreciate the contribution of each.

Here is the record for the four legs to our insurance stool. The underwriting profits signify that all four provided funds to Berkshire last year without cost, just as they did in 2007. And in both years our underwriting profitability was considerably better than that achieved by the industry. Of course, we ourselves will periodically have a terrible year in insurance. But, overall, I expect us to *average* an underwriting profit. If so, we will be using free funds of large size for the indefinite future.

	Underwriting Profit		*Yearend Float*	
			(in millions)	
Insurance Operations	*2008*	*2007*	*2008*	*2007*
General Re	$ 342	$ 555	$21,074	$23,009
BH Reinsurance	1,324	1,427	24,221	23,692
GEICO	916	1,113	8,454	7,768
Other Primary	210	279	4,739	4,229
	$2,792	$3,374	$58,488	$58,698

Manufacturing, Service and Retailing Operations

Our activities in this part of Berkshire cover the waterfront. Let's look, though, at a summary balance sheet and earnings statement for the entire group.

Balance Sheet 12/31/08 (in millions)

Assets		*Liabilities and Equity*	
Cash and equivalents	$ 2,497	Notes payable	$ 2,212
Accounts and notes receivable	5,047	Other current liabilities	8,087
Inventory	7,500	Total current liabilities	10,299
Other current assets	752		
Total current assets	15,796		
Goodwill and other intangibles	16,515	Deferred taxes	2,786
Fixed assets	16,338	Term debt and other liabilities	6,033
Other assets	1,248	Equity	30,779
	$49,897		$49,897

Earnings Statement (in millions)

	2008	*2007*	*2006*
Revenues	$66,099	$59,100	$52,660
Operating expenses (including depreciation of $1,280 in 2008, $955 in 2007 and $823 in 2006)	61,937	55,026	49,002
Interest expense	139	127	132
Pre-tax earnings	4,023*	3,947*	3,526*
Income taxes and minority interests	1,740	1,594	1,395
Net income	$ 2,283	$ 2,353	$ 2,131

*Does not include purchase-accounting adjustments.

This motley group, which sells products ranging from lollipops to motor homes, earned an impressive 17.9% on average tangible net worth last year. It's also noteworthy that these operations used only minor financial leverage in achieving that return. Clearly we own some terrific businesses. We purchased many of them, however, at large premiums to net worth – a point reflected in the goodwill item shown on our balance sheet – and that fact reduces the earnings on our average *carrying* value to 8.1%.

Though the full-year result was satisfactory, earnings of many of the businesses in this group hit the skids in last year's fourth quarter. Prospects for 2009 look worse. Nevertheless, the group retains strong earning power even under today's conditions and will continue to deliver significant cash to the parent company. Overall, these companies improved their competitive positions last year, partly because our financial strength let us make advantageous tuck-in acquisitions. In contrast, many competitors were treading water (or sinking).

The most noteworthy of these acquisitions was Iscar's late-November purchase of Tungaloy, a leading Japanese producer of small tools. Charlie and I continue to look with astonishment – and appreciation! – at the accomplishments of Iscar's management. To secure one manager like Eitan Wertheimer, Jacob Harpaz or Danny Goldman when we acquire a company is a blessing. Getting three is like winning the Triple Crown. Iscar's growth since our purchase has exceeded our expectations – which were high – and the addition of Tungaloy will move performance to the next level.

MiTek, Benjamin Moore, Acme Brick, Forest River, Marmon and CTB also made one or more acquisitions during the year. CTB, which operates worldwide in the agriculture equipment field, has now picked up six small firms since we purchased it in 2002. At that time, we paid $140 million for the company. Last year its pre-tax earnings were $89 million. Vic Mancinelli, its CEO, followed Berkshire-like operating principles long before our arrival. He focuses on blocking and tackling, day by day doing the little things right and never getting off course. Ten years from now, Vic will be running a much larger operation and, more important, will be earning excellent returns on invested capital.

Finance and Financial Products

I will write here at some length about the mortgage operation of Clayton Homes and skip any financial commentary, which is summarized in the table at the end of this section. I do this because Clayton's recent experience may be useful in the public-policy debate about housing and mortgages. But first a little background.

Clayton is the largest company in the manufactured home industry, delivering 27,499 units last year. This came to about 34% of the industry's 81,889 total. Our share will likely grow in 2009, partly because much of the rest of the industry is in acute distress. Industrywide, units sold have steadily declined since they hit a peak of 372,843 in 1998.

At that time, much of the industry employed sales practices that were atrocious. Writing about the period somewhat later, I described it as involving "borrowers who shouldn't have borrowed being financed by lenders who shouldn't have lent."

To begin with, the need for meaningful down payments was frequently ignored. Sometimes fakery was involved. ("That certainly looks like a $2,000 cat to me" says the salesman who will receive a $3,000 commission if the loan goes through.) Moreover, impossible-to-meet monthly payments were being agreed to by borrowers who signed up because they had nothing to lose. The resulting mortgages were usually packaged ("securitized") and sold by Wall Street firms to unsuspecting investors. This chain of folly had to end badly, and it did.

Clayton, it should be emphasized, followed far more sensible practices in its own lending throughout that time. Indeed, no purchaser of the mortgages it originated and then securitized has ever lost a dime of principal or interest. But Clayton was the exception; industry losses were staggering. And the hangover continues to this day.

This 1997-2000 fiasco should have served as a canary-in-the-coal-mine warning for the far-larger conventional housing market. But investors, government and rating agencies learned exactly nothing from the manufactured-home debacle. Instead, in an eerie rerun of that disaster, the same mistakes were repeated with conventional homes in the 2004-07 period: Lenders happily made loans that borrowers couldn't repay out of their incomes, and borrowers just as happily signed up to meet those payments. Both parties counted on "house-price appreciation" to make this otherwise impossible arrangement work. It was Scarlett O'Hara all over again: "I'll think about it tomorrow." The consequences of this behavior are now reverberating through every corner of our economy.

Clayton's 198,888 borrowers, however, have continued to pay normally throughout the housing crash, handing us no unexpected losses. This is *not* because these borrowers are unusually creditworthy, a point proved by FICO scores (a standard measure of credit risk). Their median FICO score is 644, compared to a national median of 723, and about 35% are below 620, the segment usually designated "sub-prime." Many disastrous pools of mortgages on conventional homes are populated by borrowers with far better credit, as measured by FICO scores.

Yet at yearend, our delinquency rate on loans we have originated was 3.6%, up only modestly from 2.9% in 2006 and 2.9% in 2004. (In addition to our originated loans, we've also bought bulk portfolios of various types from other financial institutions.) Clayton's foreclosures during 2008 were 3.0% of originated loans compared to 3.8% in 2006 and 5.3% in 2004.

Why are our borrowers – characteristically people with modest incomes and far-from-great credit scores – performing so well? The answer is elementary, going right back to Lending 101. Our borrowers simply looked at how full-bore mortgage payments would compare with their actual – not hoped-for – income and then decided whether they could live with that commitment. Simply put, they took out a mortgage with the intention of paying it off, whatever the course of home prices.

Just as important is what our borrowers did *not* do. They did not count on making their loan payments by means of refinancing. They did not sign up for "teaser" rates that upon reset were outsized relative to their income. And they did not assume that they could always sell their home at a profit if their mortgage payments became onerous. Jimmy Stewart would have loved these folks.

Of course, a number of our borrowers will run into trouble. They generally have no more than minor savings to tide them over if adversity hits. The major cause of delinquency or foreclosure is the loss of a job, but death, divorce and medical expenses all cause problems. If unemployment rates rise – as they surely will in 2009 – more of Clayton's borrowers will have troubles, and we will have larger, though still manageable, losses. But our problems will not be driven to any extent by the trend of home prices.

Commentary about the current housing crisis often ignores the crucial fact that most foreclosures do *not* occur because a house is worth less than its mortgage (so-called "upside-down" loans). Rather, foreclosures take place because borrowers can't pay the monthly payment that they agreed to pay. Homeowners who have made a meaningful down-payment – derived from savings and not from other borrowing – seldom walk away from a primary residence simply because its value today is less than the mortgage. Instead, they walk when they can't make the monthly payments.

Home ownership is a wonderful thing. My family and I have enjoyed my present home for 50 years, with more to come. But enjoyment and utility should be the primary motives for purchase, not profit or refi possibilities. And the home purchased ought to fit the income of the purchaser.

The present housing debacle should teach home buyers, lenders, brokers and government some simple lessons that will ensure stability in the future. Home purchases should involve an honest-to-God down payment of at least 10% and monthly payments that can be comfortably handled by the borrower's income. That income should be carefully verified.

Putting people into homes, though a desirable goal, shouldn't be our country's primary objective. Keeping them in their homes should be the ambition.

Clayton's lending operation, though not damaged by the performance of its borrowers, is nevertheless threatened by an element of the credit crisis. Funders that have access to any sort of government guarantee – banks with FDIC-insured deposits, large entities with commercial paper now backed by the Federal Reserve, and others who are using imaginative methods (or lobbying skills) to come under the government's umbrella – have money costs that are minimal. Conversely, highly-rated companies, such as Berkshire, are experiencing borrowing costs that, in relation to Treasury rates, are at record levels. Moreover, funds are abundant for the government-guaranteed borrower but often scarce for others, no matter how creditworthy they may be.

This unprecedented "spread" in the cost of money makes it unprofitable for any lender who doesn't enjoy government-guaranteed funds to go up against those with a favored status. Government is determining the "haves" and "have-nots." That is why companies are rushing to convert to bank holding companies, not a course feasible for Berkshire.

Though Berkshire's credit is pristine – we are one of only seven AAA corporations in the country – our cost of borrowing is now *far* higher than competitors with shaky balance sheets but government backing. At the moment, it is much better to be a financial cripple with a government guarantee than a Gibraltar without one.

Today's extreme conditions may soon end. At worst, we believe we will find at least a partial solution that will allow us to continue much of Clayton's lending. Clayton's earnings, however, will surely suffer if we are forced to compete for long against government-favored lenders.

	Pre-Tax Earnings *(in millions)*	
	2008	*2007*
Net investment income	$330	$ 272
Life and annuity operation	23	(60)
Leasing operations	87	111
Manufactured-housing finance (Clayton)	206	526
Other*	141	157
Income before investment and derivatives gains or losses	$787	$1,006

*Includes $92 million in 2008 and $85 million in 2007 of fees that Berkshire charges Clayton for the use of Berkshire's credit.

Tax-Exempt Bond Insurance

Early in 2008, we activated Berkshire Hathaway Assurance Company ("BHAC") as an insurer of the tax-exempt bonds issued by states, cities and other local entities. BHAC insures these securities for issuers both at the time their bonds are sold to the public (primary transactions) and later, when the bonds are already owned by investors (secondary transactions).

By yearend 2007, the half dozen or so companies that had been the major players in this business had all fallen into big trouble. The cause of their problems was captured long ago by Mae West: "I was Snow White, but I drifted."

The monolines (as the bond insurers are called) initially insured only tax-exempt bonds that were low-risk. But over the years competition for this business intensified, and rates fell. Faced with the prospect of stagnating or declining earnings, the monoline managers turned to ever-riskier propositions. Some of these involved the insuring of residential mortgage obligations. When housing prices plummeted, the monoline industry quickly became a basket case.

Early in the year, Berkshire offered to assume all of the insurance issued on tax-exempts that was on the books of the three largest monolines. These companies were all in life-threatening trouble (though they said otherwise.) We would have charged a 1½% rate to take over the guarantees on about $822 billion of bonds. If our offer had been accepted, we would have been required to pay any losses suffered by investors who owned these bonds – a guarantee stretching for 40 years in some cases. Ours was not a frivolous proposal: For reasons we will come to later, it involved substantial risk for Berkshire.
